ROME TO SEDUCTION.

J. Holden, Printer, Castle Street, London.

THE
LONDON ENCYCLOPÆDIA,
OR
UNIVERSAL DICTIONARY
OF
SCIENCE, ART, LITERATURE, AND PRACTICAL MECHANICS,
COMPRISING A
POPULAR VIEW OF THE PRESENT STATE OF KNOWLEDGE.

ILLUSTRATED BY
NUMEROUS ENGRAVINGS, A GENERAL ATLAS,
AND APPROPRIATE DIAGRAMS.

Sic oportet ad librum, presertim miscellanei generis, legendum accedere lectorem, ut solet ad convivium conviva civilis. Convivator annititur omnibus satisfacere; et tamen si quid apponitur, quod hujus aut illius palato non respondeat, et hic et ille urbane disimulant, et alia fercula probant, ne quid contristent convivatorem.
Erasmus.

A reader should sit down to a book, especially of the miscellaneous kind, as a well-behaved visitor does to a banquet. The master of the feast exerts himself to satisfy his guests; but if, after all his care and pains, something should appear on the table that does not suit this or that person's taste, they politely pass it over without notice, and commend other dishes, that they may not distress a kind host.
Translation.

R O M E.

CARUS, NUMERIAN, AND CARINUS.—Carus, who was prætorian prefect to the deceased emperor, was chosen by the army to succeed him; and he, to strengthen his authority, united with him his two sons Carinus and Numerian in command; the former of whom was as remarkable for his vices, as the latter was for his virtues. Carus had scarcely time to punish the murderers of the late monarch, when he was alarmed by a fresh irruption of the Sarmatians, over whom he gained a signal victory. The Persian monarch also made some attempts upon the empire; but Carus assured his ambassadors that, if their master persisted in his obstinacy, all his fields should shortly be as bare as his own bald head: a dreadful battle ensuing, he once more gained a complete victory. But he was shortly after struck dead by lightning in his tent, with many others around him. Numerianus was inconsolable for his death; and brought a disorder upon his eyes, we are told, with weeping. The peculiarity of his situation, after some time, excited the ambition of Aper, his father-in-law, who supposed that he could now, without danger, aim at the empire himself. He therefore hired a villain to murder the emperor in his litter; and, to conceal the fact, gave out that he was alive, but unable to endure the light. In this manner was the dead body carried about for some days, Aper continuing to attend it with the utmost respect, and to take orders as usual. However, the offensiveness of its smell, at length discovered the treachery, and excited a universal uproar. In the midst of this tumult, Dioclesian, one of the most noted commanders of his time, was chosen emperor, and with his own hand slew Aper, having thus, as it is said, fulfilled a prophecy, that he should be emperor after he had slain a boar, alluding to the name of his rival. Carinus did not long survive his father and brother; for giving himself up to his vices, and opposing the new-made emperor, the competitors led their forces into Mæsia; where, Dioclesian being victorious, Carinus was slain by a tribune of his own army, whose wife he had formerly abused.

DIOCLESIAN AND MAXIMIAN.—Dioclesian received his name from Dioclea, the town in which he was born: and was about forty years old when he was elected emperor. He pardoned all who had joined Carinus. Conscious also that the weight of the empire was too heavy for one alone to sustain, he took in Maximian, his general, as a partner in the throne. There never was a period in which the empire had more numerous or formidable enemies to oppose. In

Gaul the peasants and laborers made a dangerous insurrection, under Amandus and Heliannus, but were subdued by Maximian. Achilleus, who commanded in Egypt, proclaimed himself emperor; and it was not without many bloody engagements that he was overcome. In Africa, the Roman legions, joined with many of the natives, seized upon the public revenues, and plundered those who continued in their duty. These were also subdued by Maximian. About the same time a principal commander in Britain, named Carausius, then proclaimed himself emperor, and possessed himself of the island. To oppose this general, Maximian made choice of Constantius Chlorus, whom he created Cæsar, and married to Theodora his daughter-in-law. About this time also Narses, king of Persia, began a dangerous war, and invaded Mesopotamia. The Persians, however, were overcome in a decisive engagement, and their camp plundered and taken. There only remained, of all the enemies of the empire, those who lay to the northward, the Goths, Sarmatians, Alani, Quadi, &c., who poured down in incredible numbers. During this period, as if the external miseries of the empire had not been sufficient, the tenth and last great persecution raged against the Christians. It exceeded all the former in severity; and, such was the zeal with which it was pursued, that, in an ancient inscription, we are informed that they had effaced the name and superstition of the Christians. Their attempts, however, were but the malicious efforts of an expiring party; for Christianity soon after was established by law. In the midst of the troubles raised by this persecution, and of the contests that struck at the internal parts of the state, Dioclesian and Maximian surprised the world by resigning their dignities on the same day, and both retiring into private stations. Historians are much divided concerning the motives that thus induced them to give up those honors which they had purchased with so much danger. When some attempted to persuade Dioclesian to resume the empire, he replied, 'That, if they knew his present happiness, they would rather endeavour to imitate than disturb it.' Maximian, his partner in the empire and in resignation, was by no means so contented. He conducted various intrigues for a return to power, and endeavouring to force his own daughter, and destroy her husband, he was detected, and condemned to die by whatever death he should think proper; Lactantius tells us that he chose hanging.

CONSTANTIUS CHLORUS, AND GALERIUS.—Upon the resignation of the two emperors the

two Cæsars were universally acknowledged as their successors. They agreed to divide the empire, Constantius being appointed to govern the western parts; namely, Italy, Sicily, the greatest part of Africa, together with Spain, Gaul, Britain, and Germany: Galerius had the eastern parts; to wit, Illyricum, Pannonia, Thrace, Macedonia, all the provinces of Greece, and the Lesser Asia, with Egypt, Syria, Judea, and all the countries eastward. The greatness of the division, however, soon induced the emperors to take in two partners more, Severus and Maximin, who were made Cæsars, and assisted in the conducting of affairs; so that the empire now was under the guidance of four persons, all invested with supreme authority. We are informed but of few particulars of the reign of Constantius, except a detail of his character, which appears in every light most amiable. In the second year of his reign he went over into Britain; and, leaving his son Constantine as a kind of hostage in the court of his partner in the empire, took up his residence at York. Here, when ill past recovery, he sent for him, and, raising himself up in his bed, gave him his dying instructions. In the mean time Galerius, Constantius's partner, being informed of Constantine's advancement, testified the most ungovernable rage; declaring Severus emperor in opposition. About this time also another pretender to the empire started up. This was Maxentius, who was very much favored by the soldiers, whom he permitted to pillage at discretion. To oppose Maxentius Severus led a numerous army towards Rome; but his soldiers, considering against whom they were to fight, immediately abandoned him. To revenge his death Galerius marched into Italy, resolving to destroy the whole senate. His soldiers however, upon approaching the capital, began to waver; when he had recourse to entreaties, imploring them not to abandon him; and, retiring, made Licinius, the son of a poor laborer in Dacia, Cæsar, in the room of Severus. Soon after he was seized with a disorder which baffled all the skill of his physicians, and carried him off after he had languished in torments for nearly a year. His cruelty to the Christians was one of the many crimes alleged against him; but he abated much of his severities against them in his illness.

MAXENTIUS.—Constantine, being thus delivered from his greatest opponent, now possessed more power than any of his rivals. The empire was at that time divided between him and three others: Maxentius, who governed in Rome, a person of a cruel disposition, and a steadfast supporter of paganism; Licinius, who was adopted by Galerius, and commanded in the east; and Maximin, who had formerly been declared Cæsar with Severus, and who also governed some of the eastern provinces. For some time all things seemed to wear a peaceful appearance: till either ambition or the tyrannical conduct of Maxentius induced Constantine to engage in an expedition to expel that commander from Rome, and to make the proper preparations for marching into Italy. Upon this occasion he formed a resolution which produced a mighty change in the politics as well as the morals of mankind, and gave

a new turn to the councils of the wise and the pursuits of the ambitious. See in his life, article **CONSTANTINE**, the account of his conversion to Christianity. After this he consulted with several of the principal teachers of Christianity, and made a public avowal of that persuasion, thus attaching to his interest his soldiers, who were mostly Christians. He lost no time in entering Italy with 90,000 foot and 8000 horse; and soon advanced to the very gates of Rome. Maxentius, who had long given himself up to ease and debaucheries, now began to make preparations when it was too late. He first put in practice all the superstitious rites which paganism taught to be necessary; and then consulted the Sibylline books, whence he was informed that on that day the great enemy of Rome should perish. This prediction, which was equivocal, he applied to Constantine; wherefore, leaving all things in the best posture, he advanced from the city with an army of 100,000 foot and 18,000 horse. The engagement was for some time fierce and bloody; till, his cavalry being routed, victory declared upon the side of his opponent, and he himself was drowned in his flight by the breaking down of a bridge, as he attempted to cross the river Tiber. Constantine, in consequence of this victory, entering the city, disclaimed all the praises which the senate and people were ready to offer, ascribing his success to a superior power. He even caused the cross, which he was said to have seen in the heavens, to be placed at the right of all his statues, with this inscription: 'That, under the influence of that victorious ensign, Constantine had delivered the city from the yoke of tyrannical power.' He afterwards ordained that no criminal should for the future suffer death by the cross; and edicts were soon after issued, declaring that the Christians should be eased from their grievances, and received into places of trust and authority. Thus the new religion soon prevailed over the whole empire.

CONSTANTINE AND LICINIUS.—While this great change was proceeding, Maximin, who governed in the east, marched against Licinius with a very numerous army; but a general engagement ensued, in which Maximin suffered a total defeat. Maximin, however, having escaped the carnage, once more put himself at the head of another army, resolving to try the fortune of the field; but death anticipated his designs. Constantine and Licinius being now undisputed possessors and partners in the empire, all things promised a peaceable continuance of their friendship and power. Pagan writers ascribe the rupture that unexpectedly took place between these two potentates to Constantine; while the Christians, on the other hand, impute it to Licinius. Both sides exerted all their power, as usual, to prevail, and, at the head of very formidable armies, came to an engagement near Cybalis, in Pannonia. Previous to the battle Constantine, in the midst of the Christian bishops, begged the assistance of Heaven; while Licinius, with equal zeal, called upon the pagan priests to intercede with the gods. Constantine, after an obstinate resistance from the enemy, became victorious; took their camp; and, after some time, compelled Licinius to sue for a short truce. It was indeed short: but we have

pursued the rest of the history of the first of the Christian emperors in the article referred to. He conceived and executed the bold measure of transferring the seat of the empire from Rome to Constantinople. The empire had long before been in the most declining state; but this gave precipitation to its downfall: it never after resumed its former splendor. The inhabitants of Rome, though with reluctance, submitted to the change; nor was there for several years any disturbance in the state, until the Goths renewed their inroads on the Danube. Constantine, however, soon repressed their incursions, and so straightened them that nearly 100,000 of their number perished. The government of the empire was afterwards divided as follows:—Constantine, the emperor's eldest son, commanded in Gaul and the western provinces; Constantius governed Africa and Illyricum; and Constans ruled in Italy. Dalmatius, the emperor's brother, was sent to defend those parts that bordered upon the Goths; and Annibalianus, his nephew, had the charge of Cappadocia and Armenia Minor. The latter part of the reign of Constantine was peaceful and splendid; ambassadors from the remotest Indies came to acknowledge his authority; the Persians, who were ready for fresh inroads, upon finding him prepared to oppose, sent humbly to desire his friendship and forgiveness. He died at above sixty years old, and had reigned above thirty years.

CONSTANTINE'S SONS.—After the death of Constantine, the army and senate proclaimed his three sons emperors, without taking any notice of Dalmatius, and Annibalianus, who were soon after murdered, with Julius Constantius the late emperor's brother, and all their friends and adherents. Thus the family of Constantine was reduced to the three sons and three nephews; Gallus and Julian, the sons of Julius Constantius, and Nepotianus, the son of Eutropia, Constantine's sister. Of these Gallus owed his life to a malady, from which no one thought he could recover; and Julian to his infancy, being then only seven years of age. The three brothers divided among themselves the dominions of the deceased princes; but did not long agree. In 340 Constantine, having in vain solicited Constans to yield part of Italy to him, raised a considerable army; and under pretence of marching to the assistance of his brother Constantius, who was then at war with the Persians, made himself master of several places in Italy. Hereupon Constans detached part of his army against him; and Constantine, being drawn into an ambuscade near Aquileia, was cut off with his whole forces. His body was thrown into the Ansa; but, being afterwards discovered, was sent to Constantinople, and interred near that of his father. By the defeat and death of his brother, Constans remained sole master of all the western empire, in the quiet possession of which he continued till the year 350. This year Magnentius, the son of a native of Germany, finding Constans despised by the army on account of his indolence and inactivity, resolved to murder him, and set up for himself. Having gained over the chief officers of the army, he seized on the Imperial palace at Autun, and dis-

tributed among the populace what sums he found; which induced not only the city, but the neighbouring country, to espouse his cause. Constans being informed of what had passed, and finding himself unable to resist the usurper, fled towards Spain. He was overtaken, however, by Gaiso, whom Magnentius had sent after him with a body of troops, and despatched at Helena, near the foot of the Pyrenees.

CONSTANTIUS.—Constantius had been engaged in a war with the Persians, in which little advantage had been gained on either side; but, the Persians now giving no more disturbance, he marched against the usurpers; for besides Magnentius there were at this time two other pretenders to the western empire. Veteranio, general of the foot in Pannonia, had on the first news of the death of Constans, caused himself to be proclaimed emperor by the legions under his command. He was a native of Upper Mæsia, and advanced in years when he usurped the sovereignty; but so illiterate that he then first learned to read. The third was Flavius Popilius Nepotianus, who claimed right as nephew of Constantine the Great. Having assembled a company of gladiators and men of desperate fortunes he assumed the purple on the 3d of June 350, and in that attire presented himself before the gates of Rome. The prefect Anicetus, who commanded there for Magnentius, sallied out against him with a body of Romans; who were soon driven back into the city. Soon after Nepotianus made himself master of the city itself, which he filled with blood and slaughter. Magnentius, being informed of what had happened, sent against this new competitor his chief favorite Marcellinus. Nepotianus received him with great resolution; a battle ensued between the soldiers of Magnentius and the Romans who had espoused the cause of Nepotianus; but the latter being betrayed by a senator, named Heraclitus, his men were put to flight, and he himself killed, after having enjoyed the sovereignty only twenty-eight days. Marcellinus ordered his head to be carried on the point of a lance through the principal streets of the city; put to death all those who had declared for him; and, under pretence of preventing disturbances, commanded a general massacre of all the relations of Constantine. Soon after, Magnentius himself came to Rome to make the necessary preparations for resisting Constantius, who was exerting himself to the utmost to revenge the death of his brother. In the city he behaved most tyrannically: put to death many persons of distinction; seized their estates; and obliged the rest to contribute half of what they were worth towards the expense of the war. Having thus raised great sums, he assembled an army of Romans, Germans, Gauls, Franks, Britons, Spaniards, &c.; but, dreading the uncertain issues of war, he despatched ambassadors to Constantius with proposals of accommodation. Constantius set out from Antioch about the beginning of autumn; and, passing through Constantinople, arrived at Heraclea, where he was met by the deputies of Magnentius, and others from Veteranio, who had agreed to support each other in case the emperor would hearken to no

terms. The deputies of Magnentius proposed a match between him and Constantina, the sister of Constantius, and widow of Annibalianus; offering, at the same time, to Constantius the sister of Magnentius. The emperor would hearken to no terms with Magnentius; but, that he might not have to oppose two enemies at once, concluded a separate treaty with Veterano, by which he agreed to take him for his partner in the empire. But, when Veterano ascended the tribunal along with Constantius, the soldiers pulled him down, saying they would acknowledge no emperor but Constantius. On this Veterano threw himself at the emperor's feet, and implored his mercy. Constantius received him with great kindness, and sent him into Bithynia, where he allowed him a maintenance suitable to his quality. Now master of all Illyricum, and of the army commanded by Veterano, Constantius resolved to march against Magnentius. In the mean time, however, on advice that the Persians were preparing to invade the eastern provinces, he married his sister Constantina to his cousin german Gallus; created him Cæsar on the 15th of March; and allotted him for his share not only all the east, but likewise Thrace and Constantinople.

About the same time Magnentius gave the title of Cæsar to his brother Decentius, whom he despatched into Gaul to defend that country against the barbarians who had invaded it; for Constantius had not only stirred up the Franks and Saxons to break into that province by promising to relinquish to them all the places they should conquer, but had sent him large supplies of men and arms for that purpose. On this encouragement the barbarians invaded Gaul with a great army, overthrew Decentius in a pitched battle, committed every where dreadful ravages, and reduced the country to a most deplorable situation. Mean time Magnentius, having assembled a numerous army, left Italy, and, crossing the Alps, advanced into the plains of Pannonia, where Constantius, whose main strength consisted of cavalry, was waiting for him. Magnentius, hearing that his competitor was encamped at a small distance, invited him by a messenger to the extensive plains of Sciscia on the Sauve, there to decide which of them had the best title to the empire. This challenge was by Constantius received with great joy; but, as his troops marched towards Sciscia in disorder, they fell into an ambuscade, and were put to flight. With this success Magnentius was so elated that he rejected all terms of peace; after some time, a general engagement ensued at Mursa, in which Magnentius was entirely defeated, with the loss of 24,000 men. Constantius, though victor, is said to have lost 30,000. All authors agree that the battle proved fatal to the western empire, and greatly contributed to its speedy decline. After his defeat at Mursa, Magnentius retired into Italy, where he recruited his scattered forces as well as he could. But in the beginning of the following year, 352, Constantius, having assembled his troops, surprised and took a strong castle on the Julian Alps, belonging to Magnentius, without the loss of a man. After this the emperor ad-

vanced in order to force the rest; upon which Magnentius was struck with such terror that he immediately abandoned Aquileia, and ordered the troops that guarded the other passes of the Alps to follow him. Thus Constantius, entering Italy without opposition, made himself master of Aquileia. Thence he advanced to Pavia, where Magnentius gained a considerable advantage over him. Notwithstanding this loss, Constantius reduced the whole country bordering on the Po, and Magnentius's men deserted to him in whole troops, delivering up to him the places they had garrisoned; by which the tyrant was so disheartened that he left Italy, and retired with all his forces into Gaul. Soon after this, Africa, Sicily, and Spain, declared for Constantius; upon which Magnentius sent a senator, and after him some bishops, to treat of a peace; but the emperor treated the senator as a spy, and sent back the bishops without an answer. Finding his affairs now desperate, and that there was no hopes of pardon, Magnentius recruited his army in the best manner he could, and despatched an assassin into the east to murder Gallus Cæsar. The assassin gained over some of Gallus's guards; but the plot being discovered they were all seized and executed as traitors. In 353 the war against Magnentius was carried on with more vigor than ever, and at last happily ended by a battle fought in that part of Gaul afterwards called Dauphiny. Magnentius, being defeated, took shelter in Lyons: but the few soldiers who attended him, despairing of any further success, resolved to purchase the emperor's favor by delivering up to him his rival. Accordingly they surrounded the house where he lodged; upon which the tyrant, in despair, slew with his own hand his mother, his brother Desiderius, whom he had created Cæsar, and such of his friends and relations as were with him; and then, fixing his sword in a wall, threw himself upon it. After the death of Magnentius, his brother Decentius, finding himself surrounded on all sides by the emperor's forces, chose also to strangle himself. Thus Constantius was left sole master of the Roman empire. His panegyrist says that after his victory he behaved with the greatest humanity, forgiving and receiving into favor his greatest enemies; other historians tell us that he now became haughty, imperious, and cruel, of which many instances are given. In this year, 353, the empire was subject to very grievous calamities. Gaul was ravaged by the barbarians beyond the Rhine, and the disbanded troops of Magnentius: at Rome the populace rose on account of a scarcity of provisions. In Asia the Isaurian robbers over-ran Lycaonia and Pamphylia and laid siege to Seleucia. At the same time the Saracens committed dreadful ravages in Mesopotamia; the Persians also invaded the provinces of Anthemusia on the Euphrates. But the Eastern provinces were not so much harassed by barbarians as by Gallus Cæsar himself, who ought to have protected them. That prince was naturally of a cruel, haughty, and tyrannical disposition; but, elated with his successes against the Persians, he at last behaved like a madman. His cruelty is said to have been heightened by the instigations of his wife Constantina, who is

by Ammianus styled the *Megara*, or 'fury of her sex;' and he adds that her ambition was equal to her cruelty. Thus all the provinces and cities in the east were filled with blood and misery. No man, however innocent, was sure to live or enjoy his estate a whole day; for, Gallus's temper being equally suspicious and cruel, those who had any private enemies took care to accuse them of crimes against the state. At last the emperor being informed from all quarters of his conduct, and also that he aspired to the sovereignty, resolved upon his ruin. He wrote letters to Gallus and Constantina, inviting them both into Italy, and they durst not venture to disobey the emperor's express command. Constantina, who was well acquainted with her brother's temper, set out first, leaving Gallus at Antioch: but she had scarcely entered the province of Bithynia, when she was seized with a fever which put an end to her life. Gallus, now despairing of being able to appease his sovereign, thought of openly revolting; but most of his friends deserted him, so that he was at last obliged to submit unreservedly to Constantius. He advanced, therefore, according to his orders; but at Pitavium was arrested, and stripped of all the ensigns of dignity. Thence he was carried to Flanona, in Dalmatia. He confessed most of the crimes laid to his charge; but urged as an excuse the evil councils of his late wife. The emperor, provoked at this plea, and instigated by the enemies of Gallus, signed a warrant for his execution. All this time the emperor had been engaged in a war with the Germans; and, though he gained no advantage, the barbarians thought proper to make peace with him. This, however, was but short lived. No sooner was the Roman army withdrawn, than they began to make new inroads. Against them Constantius despatched Arbetio with the flower of the army; but he fell into an ambuscade, and was put to flight with great loss. This, however, was soon retrieved by the valor of Arintheus, who became famous in the reign of Valens, and of two other officers, who falling upon the enemy, without waiting the orders of their general, put them to flight, and obliged them to leave the Roman territory. The tranquillity of the empire, which ensued on this repulse of the Germans, was soon interrupted by a pretended conspiracy, but by which in the end a true one was produced. Sylvanus, a leading man among the Franks, commanded in Gaul, and had there performed great exploits against the barbarians. He had been raised to his post by Arbetio, only with a design to remove him from the emperor's presence, in order to accomplish his ruin, which he did in the following manner: one Dynames, leaving Gaul, begged of Sylvanus letters of recommendation to his friends at court; which being granted, the traitor erased all but the subscription. He then inserted directions to the friends of Sylvanus for the carrying on a conspiracy; and delivering these forged letters to the prefect Lampridius, they were by him shown to the emperor. Thus Sylvanus was in a manner forced into revolt, and caused himself to be proclaimed emperor. In the mean time, Dynames having forged another letter, the fraud was discovered, and an enquiry

set on foot, which brought to light the whole matter. Sylvanus was declared innocent, and letters sent to him by the emperor confirming him in his post: they were scarcely despatched, when the news arrived of Sylvanus having revolted. Thunder-struck at this news, Constantius despatched against him Ursicinus, an officer of great valor, who, pretending to be Sylvanus's friend, cut him off by treachery. The barbarians, who had been hitherto kept quiet by the brave Sylvanus, no sooner heard of his death than they broke, with greater fury than ever, into Gaul; and took and pillaged about forty cities, and among the rest Cologne, which they levelled with the ground; while the Quadi and Sarmatians, entering Pannonia, destroyed every thing with fire and sword. The Persians overran, without opposition, Armenia and Mesopotamia: Prosper and Mausonianus, who had succeeded in the government of the east, being more intent upon pillaging than defending the provinces committed to them. Constantius, not thinking it advisable to leave Italy, raised his cousin Julian to the dignity of Cæsar.

Julian seems to have been a man of extraordinary talents; for though hitherto entirely buried in obscurity, and conversant only with books, no sooner was he placed at the head of an army than he behaved with the greatest bravery and skill. He was appointed governor of Gaul; but before he set out Constantius gave him in marriage his sister Helena. He, however, limited his authority; gave him written instructions how to behave; ordered the generals who served under him to watch his actions, and strictly enjoined Julian himself not to give any largesses to the soldiery. Julian set out from Milan on the 1st of December 355, the emperor himself accompanying him as far as Pavia; whence he pursued his journey to the Alps, attended only by 360 soldiers. On his arrival at Turin he was first acquainted with the loss of Cologne. He arrived at Vienne before the end of the year 355. In 356 the barbarians besieged Autun. Julian marched to his relief, but found the siege raised: on which he pursued the barbarians to Auxerre and Troies, and put them to flight with a handful of men. From Troies he hastened to Rheims, where the main body of the army, commanded by Marcellus, awaited his arrival. Thence he took his route towards Decempagi (now Dieuze), on the Seille in Lorraine, to oppose the Germans who were ravaging that province. But the enemy attacking his rear had nearly cut off two legions. A few days after he defeated the Germans, though with great loss to his own army: the victory, however, opened him a way to Cologne. Here he caused the ancient fortifications to be repaired, and the houses rebuilt; after which he took up his winter quarters at Sens. Constantius entered Germany on the side of Rætia, laid waste the country far and wide; and obliged the barbarians to sue for peace. He enacted two laws: 1. declaring idolatry capital; and, 2. granting the effects of condemned persons to their children and relations within the third degree. In the beginning of 357 the barbarians besieged Julian a whole month in Sens: Marcellus, the commander-in-chief, never once offering to assist

him. Julian, however, so valiantly defended himself with the few forces he had that the barbarians at last retired. After this Constantius declared Julian commander-in-chief of all the forces in Gaul; appointing under him one Severus, an officer of great experience, and of a quite different disposition from Marcellus. On his arrival Julian raised new troops, and supplied them with arms which he found in an old arsenal. The emperor, resolving to put a stop to the terrible devastations committed chiefly by the Alemans, wrote to Julian to march directly against them. At the same time he sent Barbatio, the successor of Sylvanus, with 25,000 or 30,000 men, out of Italy, in order to enclose the enemy between two armies. The Leti, however, a German nation, passing between the armies, advanced as far as Lyons, hoping to surprise that wealthy city; but, meeting with a warmer reception than they expected, contented themselves with ravaging the country all round it. On the first notice of this expedition Julian detached strong parties to guard the passages through which he knew the barbarians must return. Thus they were all cut off except those who marched near the camp of Barbatio; who was so far from cutting off their retreat that he complained by a letter to Constantius of some officers for attempting it. These officers, among whom was Valentinian, afterwards emperor of the west, were, by the orders of Constantius, cashiered for their disobedience. The other barbarians either fortified themselves in the countries which they had seized, or took shelter in the islands formed by the Rhine. Julian resolved first to attack the latter; and with this view demanded some boats of Barbatio; but he, instead of complying with his request, immediately burnt his boats, as he did on another occasion the provisions which had been sent to both armies, after he had plentifully supplied his own. Julian, not in the least disheartened with this unaccountable conduct, persuaded some of the most resolute of his men to wade over to one of the islands. Here they killed all the Germans who had taken shelter in it. They then seized their boats, and pursued the slaughter in several other islands, till the enemy abandoned them all, and retired, with their wives and booty, to their respective countries. On their departure Barbatio attempted to form a bridge of boats on the Rhine; but the enemy, apprised of his intention, threw a great number of huge trees into the river; which, being carried by the stream against the boats, sunk several of them. The Roman general then retired; but the barbarians, falling unexpectedly upon him, cut off great numbers of his men, and returned loaded with booty. Elated with this success they assembled in great numbers under the command of Chnodomarius, a prince of great renown among them, and six other kings. They encamped in the neighbourhood of Strasburg. Here they were encountered by Julian, who put them to flight with the loss of 6000 or 8000 of their men slain in the field, and a greater number drowned in the river; while Julian himself lost only 243 men and four tribunes. In this action Chnodomarius was taken and sent to Rome, where he soon after died. After the battle Julian advanced

with all his army to Mayence, where he built a bridge over the Rhine, and, having with difficulty prevailed upon his army to follow him, entered Germany. Here he ravaged the country, till, being prevented by snow from advancing, he began to repair the fort of Trajan, about three or four leagues from Frankfort. The barbarians, now alarmed, sent deputies to treat of a peace; but this Julian refused to grant upon any terms. He consented, however, to a truce of seven months, upon their promising to store with provisions the fort he was building. In 358 he took the field against the Franks, who were divided into several tribes, the most powerful of which were the Salii and Chamavi. The first of these he soon subdued; after which he allotted them lands in Gaul, incorporating great numbers into his cavalry. He next marched against the Chamavi, whom he defeated and obliged to retire beyond the Rhine. Afterwards he rebuilt three forts on the Meuse, which had been destroyed by the barbarians; but, wanting provisions, he ordered 600 or 800 vessels to be built in Britain to bring corn from thence into Gaul. Julian continued in the country of the Chamavi till the expiration of his truce with the Alemans, and then, laying a bridge of boats over the Rhine, entered their country with fire and sword. At last two of their kings came in person to sue for peace; which Julian granted on their promising to set at liberty the captives they had taken; to supply a certain quantity of corn when required; and to furnish wood, iron, and carriages, for repairing the cities they had ruined. The prisoners released amounted to upwards of 20,000. Soon after the vernal equinox Constantius marched against the Quadi and Sarmatians, whose country lay beyond the Danube. Having crossed that river he laid waste the territories of the Sarmatians; who thereupon came in great numbers, together with the Quadi, pretending to sue for peace. Their true design was to surprise the Romans; but the latter, suspecting it, fell upon them sword in hand. This obliged the rest to sue for peace in earnest, which was granted on the delivery of hostages. The emperor then marched against the Limigantes, i.e. the slaves who, in 334, had driven the Sarmatians out of their country. They used the same artifice as the Sarmatians and Quadi had done, coming in great numbers to the emperor under pretence of submission, but prepared to fall upon him unexpectedly. Observing their manner, and distrusting them, he caused his troops to surround them insensibly while he was speaking. The Limigantes then displeased with the conditions he offered them, laid their hands on their swords: on which they were attacked by the soldiers; and, finding it impossible to escape, made with great fury towards the tribunal, where they were cut in pieces. After this the emperor ravaged their territories, and obliged them to quit the country, which was then restored to the Sarmatians. This year a haughty embassy arrived from Sapor king of Persia, with a letter, in which that monarch styled himself 'king of kings, brother of the sun and moon,' &c., acquainting the emperor that, though he might insist on having all the countries beyond the Strymon in Macedon

delivered up to him, he would be contented with Armenia and Mesopotamia, which had been unjustly taken from his grandfather Narses; adding that, unless justice was done him, he would assert his right by arms. Constantius wrote in answer that as he had maintained the Roman dominions in their full extent when he was possessed only of the east, he could not suffer them to be curtailed now he was master of the whole empire. In a few days, however, he sent another message with presents; being desirous at least to put off the war till he had secured the northern provinces. This embassy proved unsuccessful, as did also another which was sent soon after.

In 359 Julian continued his endeavour for relieving Gaul; erected magazines in different places; visited the cities which had suffered most, and gave orders for repairing the fortifications. He then crossed the Rhine, and pursued the war in Germany with such success that the barbarians submitted to his own terms. In the mean time the emperor, having received intelligence that the Limigantes had quitted the country in which he had placed them, hastened to the banks of the Danube, in order to prevent their entering Pannonia, and nearly extirpated them. This year Constantius instituted a court of inquisition against all those who consulted heathen oracles. Paulus Catena, a cruel informer, was despatched into the east to prosecute them; and Modestus, equally remarkable for his cruelty, was appointed judge. His tribunal was erected at Scythopolis in Palestine, whither persons of both sexes, and of every rank and condition, were daily dragged in crowds from all parts, and torn in pieces by racks, or publicly executed. In 359 Sapor king of Persia began hostilities. During the campaign, however, he made little progress; having only taken two Roman forts, and destroyed the city of Amida, the siege of which is said to have cost him 30,000 men. On the first news of the invasion, Constantius had sent Ursicinus into the east; but his enemies prevented him from receiving the supplies necessary for carrying on the war. On his return, he was charged with the loss of Amida, and all the disasters that had happened during the campaign. Two judges were appointed to enquire into his conduct; but they left the matter doubtful. On this Ursicinus was so much exasperated that he appealed to the emperor, and, in the heat of passion, let fall some unguarded expressions, for which he was deprived of all his employments. Constantius resolved to march next year in person against the Persians, and wrote to Julian to send him part of his forces, without considering that by so doing he would have left Gaul exposed. Julian resolved to comply with the emperor's orders, but to abdicate the dignity of Caesar, that he might not be blamed for the consequences. Accordingly he suffered the best soldiers to be draughted: they were, however, unwilling to leave him, and at last proclaimed him emperor. Whether this was done absolutely against Julian's consent is uncertain; but he wrote to the emperor, and persuaded the whole army also to send a letter, in which they acquainted Constantius with what had happened,

and entreated him to acknowledge Julian as his partner. But this was positively refused by Constantius, who began to prepare for war. Julian, then, causing his troops to take an oath of allegiance to himself, with surprising expedition made himself master of the whole of Illyricum, and the important pass separating that country from Thrace. Constantius was thunder-struck with this news; but, hearing that the Persians had retired, he marched with all his forces against his competitor. On his arrival at Tarsus in Cilicia, however, he was seized with a feverish distemper, occasioned chiefly by perplexity of mind; and, at the foot of Mount Taurus, breathed his last, on the 13th of November, 361, in the forty-fifth year of his age.

JULIAN.—By the death of Constantius, Julian became master of the empire without a rival. He had been educated in the Christian religion; but, having secretly apostatized long before, as soon as he saw himself master of Illyricum, he openly caused the temples of the gods to be reopened. When the messengers arrived at Naissus in Illyricum, to acquaint him with Constantius's death, they found him consulting the entrails of victims concerning the event of his journey: and he immediately set out for Constantinople. At Heraclea he was met by almost all the inhabitants of this metropolis, into which he made his public entry on the 11th of December 361, attended by the senate, magistrates, and nobility. Here he was again declared emperor by the senate; and, as soon as that ceremony was over, caused the obsequies of Constantius to be performed with great pomp. His first care was to enquire into the conduct of the late emperor's ministers. Several of these, having been found guilty of enormous crimes, were condemned and executed; particularly a noted informer Catena, and another named Apodamus, were sentenced to be burnt alive. Along with these, however, was put to death Ursula, a man of unexceptionable character, to whom Julian himself was highly indebted. He next set about reforming the court: reduced the officers called *agentes in rebns*, from 10,000 to seventeen; and discharged thousands of cooks, barbers, &c., who by their large salaries drained the exchequer. The *curiosi*, whose office it was to inform the emperor of what had passed in the different provinces, were all discharged. Thus he was enabled to ease the people of the heavy taxes with which they were loaded, by abating a fifth part of them throughout the empire. Julian next invited to court the philosophers, magicians, &c., from all parts; but did not raise any persecution against the Christians. On the contrary, he recalled from banishment the orthodox bishops who had been exiled during the former reign; with a design, however, as is observed both by the Christian and Pagan writers, to sow dissensions in the church. As the Persians were now preparing to carry on the war with vigor, Julian resolved to march against them in person. But before he set out he formed at Constantinople a large harbour to shelter the ships from the south wind, built a magnificent porch leading to it, and erected a fine library, in which he lodged his books. In May 362 he de-

parted for Antioch; and on the 1st of January, 363, renewed in that city the sacrifices of Jupiter for the safety of the empire. During his stay he continued his preparations for the Persian war, consulting the oracles, aruspices, magicians, &c. Those of Delphi, Delos, and Dodona, assured him of victory. The aruspices, indeed, and most of his courtiers and officers, did all that lay in their power to divert him from his expedition; but the flattering answers of the oracles, and the desire of adding the Persian monarch to the many kings he had already seen humbled at his feet, prevailed. Many nations sent deputies offering their assistance; whose offers he rejected, telling them that the Romans were to assist their allies, but stood in no need of any assistance from them. He likewise rejected, and in a very stern manner, the offers of the Saracens; answering, when they complained of his stopping the pension paid them by other emperors, that a warlike prince had steel, but no gold. However, he wrote to Arsaces, king of Armenia, enjoining him to keep his troops in readiness to execute the orders he should transmit to him. Julian now sent orders to his troops to cross the Euphrates, designing to enter the enemy's country before they had notice of his march; and proceeded himself to Litarba. Thence he went to Beræa, where he halted a day, and exhorted the council to restore the worship of the gods; as he did also at Batnæ; and was well pleased with the inhabitants for having before his arrival restored that worship. He now pursued his journey to Hierapolis, the capital of Euphratesiana, which he reached on the 9th of March. As he entered this city, fifty of his soldiers were killed by the fall of a porch. He left Hierapolis on the 13th of March; and, having passed to Euphrates on a bridge of boats, came to Batnæ a city of Osrhoene, about ten leagues from Hierapolis. From Batnæ he proceeded to Carrhæ; where, in the famous temple of the moon, it is said he sacrificed a woman. While he continued in this city, he received advice that a party of the enemy's horse had broken into the Roman territories: on which he resolved to leave an army in Mesopotamia, while he advanced on the other side of the country into the Persian dominions. This army consisted, according to some, of 20,000, others say of 30,000, chosen troops. It was commanded by Procopius, and Sebastian, a famous Manichean who had been governor of Egypt. These two were to join Arsaces king of Armenia, to lay waste the plains of Media, and meet the emperor in Assyria. To Arsaces Julian himself wrote, threatening to treat him as a rebel if he did not execute the orders given him; and telling him that the God he adored would not be able to screen him from his indignation. There were two roads leading from Carrhæ to Persia; the one to the left by Nisibis; the other to the right through Assyria, along the banks of the Euphrates. Julian chose the latter, but caused magazines to be erected on both roads; and, after having viewed his army, set out on the 25th of March. He passed the Abora, which separated the Roman and Persian dominions, near its conflux with the Euphrates; after which he broke down

the bridge, that his troops might not desert. As he proceeded on his march, a soldier and two horses were struck dead by lightning; and a lion of an extraordinary size was despatched by the soldiers. These omens occasioned great disputes among the aruspices. Having passed the Abora, Julian entered Assyria, which he laid waste; a step which was judged very impolitic. As he met with no army to oppose him, he advanced to the walls of Ctesiphon, the metropolis of the Parthian empire; and here, having caused the canal to be cleared, formerly dug by Trajan, he conveyed his fleet to the banks of the Tigris, passed that river, and drove the enemy into the city with the loss of a great number of men: he himself, in the mean time, losing only seventy-five. Julian had now advanced so far into the enemy's country that he found it necessary to think of a retreat, as it was impossible for him to winter there. For this reason he made no attempt on Ctesiphon, but began to march back along the banks of the Tigris. In the mean time the king of Persia was assembling a formidable army; but, desirous of putting an end to so destructive a war, sent very advantageous proposals of peace to Julian. These he imprudently rejected; and soon after, deceived by treacherous guides, quitted the river, and entered into an unknown country totally laid waste by the enemy. A still worse step he was persuaded to take by these guides, viz. to burn his fleet, lest it should fall into the hands of the enemy. As soon as it was set on fire, the whole army cried out that the emperor was betrayed, and that the guides were traitors. Julian ordered them immediately to be put on the rack, upon which they confessed the treason; but it was too late. The fleet was in flames, and no part was saved except twelve vessels designed to be made use of in the building of bridges. The emperor thus finding himself in a strange country, and his army greatly dispirited, called a council, in which it was resolved to proceed for Corduene south of Armenia. But they had not proceeded far when they were met by the king of Persia, at the head of a very numerous army. Several sharp encounters took place; and, though the Persians were always defeated, the Romans reaped no advantages, being reduced to the last extremity for want of provisions. In one of these attacks, when the Romans were suddenly assailed, the emperor, eager to repulse the enemy, hastened to the field without his army, when he received a mortal wound by a dart, which pierced through his side to his liver. Of this wound he died the same night, 26th of June, 363, in the thirty-second year of his age, after having reigned scarcely twenty months.

JOVIAN.—As Julian had declined naming any successor, the army unanimously chose Jovian, a very able commander, whose father had lately resigned the post of comes domesticorum. The valor and experience of Jovian, however, were not sufficient to extricate the Roman army from the difficulties in which they had been plunged. Famine raged in the camp to such a degree that not a single man would have been left had not the Persians unexpectedly sent proposals of peace, which were received with great joy. The

terms were, that Jovian should restore to the Persians the five provinces which had been taken from them in the reign of Dioclesian, with several castles, and the cities of Nisibis and Singara. After the conclusion of the treaty, Jovian pursued his march homeward. When he arrived at Antioch he revoked all the laws made by Julian against Christianity; espoused the cause of the orthodox Christians against the Arians; and recalled all those who had been formerly banished, particularly Athanasius. But he did not live to make any great alterations, or even to visit his capital as emperor; for in his way to Constantinople he was found dead in his bed, on the 17th of February, 364, in his thirty-third year, when he had reigned only seven months and forty days.

VALENTINIAN AND VALENS.—Valentinian was now chosen emperor. Immediately on his accession, the soldiers with great clamor required him to choose a colleague. In a few days he named his brother Valens; and, as the empire was threatened on all sides with an invasion of the barbarous nations, he thought proper to divide it. This famous partition was made at Mediana in Dacia: when Valens had for his share the whole of Asia, Egypt, and Thrace; and Valentinian all the west; that is, Illyricum, Italy, Gaul, Spain, Britain and Africa. After this Valens returned to Constantinople, where the beginning of his reign was disturbed by the revolt of Procopius, a relation of Julian. On the death of that emperor, he had fled into Taurica Chersonesus for fear of Jovian; but returned in disguise, where, having gained over Eugenius, a eunuch of great wealth, disgraced by Valens, and some officers who commanded the troops sent against the Goths, he got himself proclaimed emperor. At first he was joined only by the lowest of the people, but at length he was acknowledged by the city of Constantinople. On the news of this revolt, Valens despatched some troops against the usurper; but these were gained over, and Procopius continued for some time to gain ground. It is probable he would finally have succeeded, had he not become so much elated with his good fortune that he grew tyrannical. In consequence of this he was first abandoned by some of his principal officers; and soon after defeated in battle, taken prisoner, and put to death. This revolt produced a war betwixt Valens and the Goths. The latter, having been solicited by Procopius, had sent 3000 men to his assistance. On hearing the news of the usurper's death, they marched back: but Valens detached against them a body of troops, who took them all prisoners. Athanaric, king of the Goths, expostulated with Valens; but that emperor proving obstinate, both parties prepared for war. In 367 and 369 Valens gained great advantages over his enemies: and obliged them to sue for peace. The rest of this reign contains nothing remarkable, except the cruelty with which Valens persecuted the orthodox clergy. The latter sent eighty of their number to lay their complaints before him; but he, instead of giving them any relief, determined to put them all to death. A persecution was also commenced against the magicians, which occasioned the de-

struction of many innocent persons; for books and persons of all ranks were seized with such terror at his severity on this point, that many burnt their libraries, lest books of magic should have been secretly conveyed into them. In 373 the Goths, whom Valens had admitted into Thrace, advanced from that province to Macedon and Thessaly. They afterwards blocked up Constantinople, plundered the suburbs, and at last totally defeated and killed the emperor. The day after the battle, hearing that an immense treasure was lodged in Adrianople, the barbarians laid siege to that place: but were repulsed with great slaughter. Great numbers of them after this were cut in pieces by the Saracens, whom Maria their queen had sent to the assistance of the Romans; so that they were obliged to abandon this design likewise, and retire from the neighbourhood of the capital. In the beginning of the reign of Valentinian the province of Libya Tripolitana was grievously oppressed by the barbarians of the desert, and almost equally so by Romanus its own governor. His conduct was so exceedingly oppressive that the inhabitants sent a deputation to Valentinian, complaining of their unhappy situation, and desiring redress. Palladius was accordingly sent to inquire into the state of the province; but he made a false report to the emperor, and thus the unhappy province was left a prey to the merciless invaders and rapacious governor. During the rest of this reign the barbarians continued their inroads into the empire. Valentinian expired in the year 375, the fifty-fifth of his age, and twelfth of his reign.

GRATIAN AND THEODOSIUS.—At the death of Valens the eastern and western empires again fell into the hands of a single person. This was Gratian, who had held the empire of the west after the death of Valentinian. He repulsed many barbarous nations who threatened the empire with dissolution; but, finding himself pressed on all sides, he, on the 19th of January 379, declared Theodosius his partner in the empire, and committed to his care all the provinces which had been governed by Valens. Theodosius is greatly extolled by historians for his extraordinary valor and piety; and has even been honored with the surname of the Great. From the many persecuting laws, however, made in his time, it would seem that his piety was misguided; and that, if he was naturally humane and compassionate, superstition often obscured these virtues. He certainly was a man of great military talent, and the state of the empire called for all his abilities. The provinces of Dacia, Thrace, and Illyricum, were already lost; the Goths, Taisali, Alans, and Huns, were masters of the greatest part of these provinces, and had ravaged and laid waste the rest. The Iberians, Armenians, and Persians, were in arms, and ever ready to take advantage of the distracted state of the empire. The few soldiers who had survived the late defeat kept within the strong holds of Thrace. In the year 379 many victories are said to have been obtained by Theodosius; but the accounts of these are so contradictory that no stress can be laid upon them. In February 380 he was seized with a dangerous malady, so that Gratian was obliged to carry on the war

alone. Apprehending that the neighbouring barbarians might break into some of the provinces, he concluded a peace with the Goths, which was confirmed by Theodosius on his recovery. But they had no sooner heard that Gratian had left Illyricum, than they passed the Danube, and, breaking into Thrace and Pannonia, advanced as far as Macedon, destroying all with fire and sword. Theodosius, drawing together his forces, marched against them, and gained a complete victory. In 381 Athanaric, the most powerful of all the Gothic princes, being driven out by a faction at home, recurred to Theodosius, by whom he was received with great tokens of friendship. He went out to meet him, and attended him with a numerous retinue into the city. The Gothic prince died the same year; and Theodosius caused him to be buried after the Roman manner, with such pomp and solemnity that the Goths, who attended him in his flight, returned home with a resolution never more to molest the Romans. Nay, out of gratitude to the emperor, they took upon them to guard the banks of the Danube, and prevent the empire from being invaded. In 383 Maximus revolted against Gratian in Britain; and in the end murdered him, and assumed the empire of the West himself. Gratian had now divided his dominions with his brother Valentinian II., whom he allowed to reign in Italy and West Illyricum, reserving the rest to himself. Maximus therefore, immediately after his usurpation, sent deputies to Theodosius, assuring him that he had no designs on the dominions of Valentinian. As Theodosius at that time found himself in danger from the barbarians, he not only therefore forbore to attack Maximus, but even acknowledged him for his partner in the empire. It was not long, however, before the ambition of the usurper prompted him to break his promise. In 387 he passed the Alps on a sudden; and, meeting with no opposition, marched to Milan, where Valentinian usually resided. The young prince fled to Aquileia; and thence to Thessalonica, to implore the protection of Theodosius; who, in answer, informed him that he was not surprised at the usurper's progress, as he had protected, and Valentinian had persecuted, the orthodox Christians. At last he prevailed on the young prince to renounce Arianism, and promised to assist him with all the forces of the east. He first, however, sent messengers to Maximus, desiring him to restore the provinces he had taken from Valentinian, and content himself with Gaul, Spain, and Britain. But the usurper would hearken to no terms. This year he besieged and took Aquileia, Quaderna, Bononia, Mutina, Rhegium, Placentia, and many other cities in Italy. In 388 he was acknowledged in Rome, and in all the provinces of Africa. Theodosius, therefore, finding a war inevitable, made preparations for it. His army consisted chiefly of Goths, Huns, Alans, and other barbarians, whom he was glad to take into the service, to prevent their raising disturbances on the frontiers. He defeated Maximus in two battles, took him prisoner, and put him to death; and, the usurper having left his son Victor in Gaul, the emperor despatched against him Arbogastes, who took

him prisoner, dispersed his troops, and put him also to death. This victory was used by Theodosius with great moderation. In 389 he took a journey to Rome, and abolished idolatry. The next year was remarkable for the destruction of the celebrated temple of Serapis in Alexandria; which, according to the description of Ammianus Marcellinus, surpassed all others in the world, that of Jupiter Capitolinus excepted. Not satisfied with the destruction of the Alexandrian temples, the zealous Theophilus, bishop of Alexandria, encouraged the people to pull down all the other temples, chapels, &c., set apart for the pagan worship, and the statues of the gods to be either burnt or melted. Of the innumerable statues which at that time were in Egypt, he spared but one, viz. that of an ape, to expose the Pagan religion to ridicule. On his return to Constantinople, Theodosius ordered such temples as were yet standing to be thrown down, and the Arians to be every where driven out of the cities.

In 392 Valentinian II. was treacherously murdered by Arbogastes his general; who, instead of seizing on the sovereignty himself, chose to confer it upon Eugenius. This new usurper, though a Christian, was greatly favored by the Pagans, who were all apprized that he only bore the title of emperor, while the whole power lodged in Arbogastes who pretended to be greatly attached to their religion. The aruspices informed him that he was destined to the empire of the whole world; that he would soon gain a complete victory over Theodosius, who was as much hated as Eugenius was beloved by the gods, &c. But, though Eugenius seemed to favor the Pagans, yet he wrote to St. Ambrose. The holy man did not answer his letter till he was pressed by some friends to recommend them to the new prince; and then he wrote to this infamous usurper with all the respect due to an emperor. Soon after his accession, Eugenius sent deputies to Theodosius; and they are said to have been received by him in a very gracious manner. He did not, however, enter into any alliance with him, but immediately began his military preparations. In 394 he set out from Constantinople, and was at Adrianople on the 15th of June that year. He bent his march through Dacia, and the other provinces between Thrace and the Julian Alps, with a design to force the passages of these mountains, and break into Italy before the army of Eugenius was in a condition to oppose him. On his arrival at the Alps, he found these passes guarded by Flavianus, prefect of Italy, at the head of a considerable body of Roman troops. These were utterly defeated by Theodosius, who thereupon crossed the Alps and advanced into Italy. He was soon met by Eugenius; and a bloody battle ensued, without any decisive advantage on either side. The next day the emperor led his troops in person against the enemy, utterly defeated them, and took their camp. Eugenius was taken prisoner by his own men, and brought to Theodosius, who reproached him with the murder of Valentinian, with the calamities he had brought on the empire by his unjust usurpation, and with the putting his confidence in Hercules, and

not in the true God; for on his chief standard he had displayed the image of that fabulous hero. Eugenius begged earnestly for his life; but, while he lay prostrate at his feet, his own soldiers cut off his head, and, carrying it about on the point of a spear, showed it to those in the camp who had not yet submitted. At this they were thunderstruck; but being informed that Theodosius was ready to receive them into favor they threw down their arms. Arbogastes, after this, despairing of pardon, fled to the mountains; but being informed that diligent search was made for him killed himself. His children, and those of Eugenius, took sanctuary in churches; but the emperor restored to them their paternal estates, and raised them to considerable employments. Soon after this, Theodosius appointed his son Honorius emperor of the west, assigning him for his share, Italy, Gaul, Spain, Africa, and West Illyricum. The next year he was seized with a dropsy, and made his will; by which he bequeathed the empire of the East to Arcadius, and confirmed Honorius in the possession of the West. He likewise confirmed the pardon he had granted to all those who had borne arms against him, and remitted a tribute which had proved very burdensome to the people. He died at Milan on the 17th January 395, in the sixteenth year of his reign and fiftieth of his age.

PART IV.

THE WESTERN EMPIRE.

We now trace, distinctly, the regular and rapid decline of the Western Empire. The death of Theodosius gave the finishing stroke to its prosperity; his son Honorius, to whom he left this part of the empire, being possessed of no abilities. The barbarians appear to have been abundantly sensible of this. Theodosius died in January; and before spring the Goths were in arms. They were now headed by an experienced commander, their celebrated king ALARIC (see that article), who would have proved formidable even in better times of the empire. He first overran Greece: Athens, Corinth, Argos, and Sparta, yielding without resistance; and the pass of Thermopylæ being betrayed to him. At last, in 397, he was opposed by Stilicho, the general of Honorius, a man of great experience in war, who defeated him with great loss. Alaric, however, found means to conclude a treaty with the ministers of Constantinople. In a subsequent conflict in Italy the wife of Alaric was taken, with all the wealth which had been amassed in plundering Greece. The victory, however, was not so decisive but that Alaric continued still formidable; and Stilicho chose rather to conclude a treaty with him. Alaric, who was not very scrupulous in his observance of this treaty, attempted in his retreat to make himself master of Verona; but Stilicho, again coming up with him near that place, gave him a third terrible defeat: after which he effected a retreat out of Italy, but not without the greatest difficulty and danger.

Italy being thus delivered, Honorius entered Rome in triumph, having Stilicho along with him in the triumphal chariot. Soon after, however, the emperor was obliged to leave the me-

tropolis and retire to Ravenna, to secure himself from the barbarians, who now broke in upon the empire on all sides. Gibbon accounts for it from a supposed revolution in the north-east parts of China. 'About four years,' he says 'after the victorious Toulon had assumed the title of khan of the Gougen, another barbarian, the haughty Rhodogast, or Radagaisus, marched from the northern extremities of Germany almost to the gates of Rome, and left the remains of his army to achieve the destruction of the west. The Vandals, the Suevi, and the Burgundians, formed the strength of this mighty host: but the Alani, who had found an hospitable reception in their new seats, added their active cavalry to the heavy infantry of the Germans; and the Gothic adventurers crowded so eagerly to the standard of Radagaisus, that by some historians he has been styled the king of the Goths: 12,000 warriors, distinguished above the vulgar by their noble birth or their valiant deeds, glittering in the van; and the whole multitude, which was not less than 200,000 fighting men might be increased by the accession of women, of children, and of slaves to the amount of 400,000 persons. This formidable emigration issued from the same coast of the Baltic which had poured forth the myriads of the Cimbri and Teutones to assault Rome and Italy in the vigour of the republic. After the departure of those barbarians, their native country, which was marked by the vestiges of their greatness, long ramparts, and gigantic moles, remained during some ages a vast and dreary solitude; till the human species was renewed by the powers of generation; and the vacancy was filled up by the influx of new inhabitants. The safety of Rome was intrusted to the counsels and the sword of Stilicho; but such was the feeble and exhausted state of the empire that it was impossible to restore the fortifications of the Danube, or to prevent, by a vigorous effort, the invasion of the Germans. The hopes of the vigilant minister of Honorius were confined to the defence of Italy. He once more abandoned the provinces; recalled the troops; pressed the new levies, which were rigorously exacted, and pusillanimously eluded; employed the most efficacious means to arrest or allure the deserters; and offered the gift of freedom, and of two pieces of gold, to all the slaves who would enlist. By these efforts he painfully collected from the subjects of a great empire an army of 30,000 or 40,000 men; which, in the days of Scipio and Camillus, would have been instantly furnished by the free citizens of the territory of Rome. The thirty legions of Stilicho were reinforced by a large body of barbarian auxiliaries; the faithful Alani were personally attached to his service; and the troops of Huns and of Goths, who marched under the banners of their native princes, Huldén and Sarus, were animated by interest and resentment to oppose the ambition of Radagaisus. The king of the confederate Germans passed, without resistance, the Alps, the Po, and the Apennines: leaving on one hand the inaccessible palace of Honorius, securely buried among the marshes of Ravenna; and, on the other, the camp of Stilicho, who had fixed his head-quar-

ters at Ticinum, or Pavia, but who seems to have avoided a decisive battle till he had assembled his distant forces. Many cities of Italy were pillaged, or destroyed; and the siege of Florence by Radagaisus is one of the earliest events in the history of that celebrated republic, whose firmness checked and delayed the unskilful fury of the barbarians. The senate and people trembled at their approach within 180 miles of Rome; and anxiously compared the danger which they had escaped with the new perils to which they were exposed. Alaric was a Christian, and a soldier, the leader of a disciplined army; who understood the laws of war, who respected the sanctity of treaties, and who had familiarly conversed with the subjects of the empire in the same camps and the same churches. The savage Radagaisus was a stranger to the manners, the religion, and even the language of the civilised nations of the south. The fierceness of his temper was exasperated by cruel superstition; and it was universally believed that he had bound himself by a solemn vow to reduce the city into a heap of stones and ashes, and to sacrifice the most illustrious of the Roman senators on the altars of those gods who were appeased by human blood. Florence was reduced to the last extremity. On a sudden they beheld from their walls the banners of Stilicho, who advanced with his united forces to the relief of the faithful city; and who soon marked that fatal spot for the grave of the barbarian host. The apparent contradictions of those writers who variously relate the defeat of Radagaisus may be reconciled without offering much violence to their respective testimonies. Their extravagant assertion that not a single soldier of the Christian army was killed, or even wounded, may be dismissed; but the rest of the narrative of Augustin and Orosius is consistent with the state of the war and the character of Stilicho. Conscious that he commanded the last army of the republic, his prudence would not expose it in the open field to the headstrong fury of the Germans. The method of surrounding the enemy with strong lines of circumvallation, which he had twice employed against the Gothic king, was repeated on a larger scale, and with more considerable effect. The example of Cæsar must have been familiar to the most illiterate of the Roman warriors; and the fortifications of Dyrrhachium, which connected twenty-four castles by a perpetual ditch and rampart of fifteen miles, afforded the model of an intrenchment, which might confine and starve the most numerous host of barbarians. The imprisoned multitude of horses and men were gradually destroyed by famine, rather than by the sword; but the Romans were exposed, during the progress of such an extensive work, to the frequent attacks of an impatient enemy. The despair of the hungry barbarians would precipitate them against the fortifications of Stilicho; the general might sometimes indulge the ardour of his brave auxiliaries, who eagerly pressed to assault the camp of the Germans; and these various incidents might produce the sharp and bloody conflicts which dignify the narrative of Zosimus, and the Chronicles of Prosper and Marcellinus.

A seasonable supply of men and provisions had been introduced into the walls of Florence; and the famished host of Radagaisus was in its turn besieged. The proud monarch of so many warlike nations, after the loss of his bravest warriors, was reduced to confide either in the faith of a capitulation, or in the clemency of Stilicho. But the death of the royal captive, who was ignominiously beheaded, disgraced the triumph of Rome and of Christianity; and the short delay of his execution was sufficient to brand the conqueror with the guilt of cool and deliberate cruelty. The famished Germans who escaped the fury of the auxiliaries were sold as slaves, at the contemptible price of as many single pieces of gold: but the difference of food and climate swept away great numbers of those unhappy strangers; and it was observed that the inhuman purchasers, instead of reaping the fruit of their labors, were soon obliged to add to it the expense of interring them. Stilicho informed the emperor and the senate of his success; and deserved a second time the glorious title of Deliverer of Italy.

'The fame of Stilicho's victory,' continues this historian, 'has encouraged a vain persuasion that the whole army, or rather nation, of Germans, who migrated from the shores of the Baltic, miserably perished under the walls of Florence. Such indeed was the fate of Radagaisus himself, of his brave and faithful companions, and of more than one-third of the various multitude of Sueses and Vandals, of Alani and Burgundians, who adhered to the standard of their general. The union of such an army might excite our surprise, but the causes of separation are obvious and forcible; they were the pride of birth, the insolence of valor, the jealousy of command, the impatience of subordination, and the obstinate conflict of opinions, of interests, and of passions, among so many kings and warriors, who were untaught to yield or to obey. After the defeat of Radagaisus, two parts of the German host, which must have exceeded the number of 100,000 men, still remained in arms between the Apennines and the Alps, or between the Alps and the Danube. It is uncertain whether they attempted to revenge the death of their general: but their irregular fury was soon diverted by the prudence and firmness of Stilicho, who opposed their march, and facilitated their retreat; who considered the safety of Rome and Italy as the great object of his care, and who sacrificed with too much indifference the wealth and tranquillity of the distant provinces. The barbarians acquired from the junction of some Pannonian deserters the knowledge of the country and of the roads, and the invasion of Gaul, which Alaric had defined, was executed by the remains of the great army of Radagaisus. When the limits of Gaul and Germany were shaken by the northern emigration, the Franks bravely encountered the single force of the Vandals; who had again separated their troops from the standard of their barbarian allies. They paid the penalty of their rashness: and 20,000 Vandals, with their king Godegiselus, were slain in the field of battle. The whole people must have been extirpated, if the squadrons of the

Alani, advancing to their relief, had not trampled down the infantry of the Franks; who, after an honorable resistance, were compelled to relinquish the unequal contest. The victorious confederates pursued their march; and on the last day of the year, in a season when the waters of the Rhine were most probably frozen, they entered without opposition the defenceless provinces of Gaul. This memorable passage of the Suevi, the Vandals, the Alani, and the Burgundians, who never afterwards retreated, may be considered as the fall of the Roman empire in the countries beyond the Alps; and the barriers which had so long separated the savage and the civilised nations of the earth were from that fatal moment levelled with the ground. While the peace of Germany was secured by the attachment of the Franks and the neutrality of the Alemanni, the subjects of Rome, unconscious of their approaching calamities, enjoyed a state of quiet and prosperity which had seldom blessed the frontiers of Gaul. This scene of peace and plenty was suddenly changed into a desert, and the prospect of the smoking ruins could alone distinguish the solitude of nature from the desolation of man. The flourishing city of Mentz was surprised and destroyed; and many thousand Christians were inhumanly massacred in the church. Worms perished after a long and obstinate siege: Strasburg, Spire, Rheims, Tournay, Arras, Amiens, experienced the most cruel oppression of the German yoke; and the consuming flames of war spread from the banks of the Rhine over the greatest part of the seventeen provinces of Gaul. That rich and extensive country, as far as the Ocean, the Alps, and the Pyrenees, was delivered to the barbarians, who drove before them in a promiscuous crowd the bishop, the senator, and the virgin, laden with the spoils of their houses and altars.

In the midst of these calamities, a revolt happened in Britain, where one Constantine, a common soldier, was raised to the imperial throne, merely for the sake of his name. He governed Britain with great prosperity; passed over into Gaul and Spain, the inhabitants of which submitted without opposition, being glad of any protector whatever from the barbarians. Honorius, incapable of defending the empire, or repressing the revolt, was obliged to acknowledge him for his partner in the empire.

In the mean time Alaric, with his Goths, threatened a new invasion, unless he was paid a certain sum of money; and Stilicho, having advised a compliance with this demand was accused, after all his services, of corrupt motives, and put to death. The money, however, not being readily sent, Alaric laid siege to Rome, and would have taken it, had not the emperor finally complied with his demand. The ransom of the city was 5000 lbs. of gold, 30,000 of silver, 4000 silk garments, 3000 skins dyed purple, and 3000 lbs. of pepper. On this occasion, the heathen temples were stripped of their remaining ornaments, and among others of the statue of Valor; which the Pagans did not fail to interpret as a presage of the speedy ruin of the state. Alaric, having received this treasure, departed for a short time; but soon after he again blocked up the city with a nume-

rous army; and again an accommodation with Honorius was set on foot. However, Rome was a third time besieged, and at last taken and plundered. Procopius says that there was not in the whole city one house left entire; and both St. Jerome and Philostorgius assert that the great metropolis of the empire was reduced to a heap of ashes and ruins. Though many of the Goths, pursuant to the orders of their general, refrained from shedding the blood of such as made no resistance; yet others more cruel and blood-thirsty, massacred all they met: so that in some quarters the streets were seen covered with dead bodies, and swimming in blood. However, not the least injury was offered to those who fled to the churches; nay the Goths themselves conveyed thither, as to places of safety, such as they were desirous should be spared. Many of the statues of the gods, that had been left entire by the emperors as excellent pieces of art, were on this occasion destroyed, either by the Goths, who, though mostly Arians, were zealous Christians, or by a dreadful storm of thunder and lightning which fell at the same time upon the city, as if it had been sent on purpose to complete with them the destruction of idolatry. Some writers, however, affirm that the city suffered very little at this time, not so much as when it was taken by Charles V. Alaric did not long survive the taking of Rome, being cut off by a violent fit of sickness in the neighbourhood of Rhegium.

After his death the affairs of Honorius seemed a little to revive by the defeat and death of Constantine and some other usurpers; but the provinces of Gaul, Britain, and Spain, were now almost entirely occupied by barbarians, in which state they continued till the death of Honorius, which happened in the year 423, after an unfortunate reign of twenty-eight years.

VALENTINIAN III.—After some usurpations which took place on his death, his nephew Valentinian III. was declared emperor of the west, and his mother, Placidia, regent during his minority. He was scarcely seated on the throne, when the empire was attacked by the Huns under the celebrated ATTILA (see that article). The empress then had two celebrated generals, Bonifacius and Aetius; who by their union might have saved the empire; but, unhappily, through the treachery of Aetius, Bonifacius revolted, and a civil war ensued. Aetius, notwithstanding his treachery, was pardoned, and put at the head of the forces. He defended it against Attila with great spirit and success, notwithstanding the deplorable situation of affairs, till he was murdered by Valentinian with his own hand. In the mean time, the provinces, except Italy itself, were totally over-run by the barbarians. Genseric, king of the Vandals, ravaged Africa and Sicily; the Goths, Suevians, Burgundians, &c., had taken possession of Gaul and Spain; and the Britons were oppressed by the Scots and Picts, so that they were obliged to call in the Saxons to their assistance. In the year 455 Valentinian was murdered by one Maximus, whose wife he had ravished.

MAXIMUS immediately assumed the empire; but felt such violent anxieties that he designed to resign it, and fly out of Italy, to enjoy the

quiet of a private life. However, being dissuaded from this by his friends, and his own wife dying soon after, he forced the empress Eudoxia to marry him. Eudoxia, who had tenderly loved Valentinian, provoked beyond measure at being married to his murderer, invited Genseric king of the Vandals into Italy. This proved a most fatal scheme; for Genseric immediately appeared before Rome; a violent tumult ensued, in which Maximus lost his life; and the city was taken and plundered by Genseric, who carried off what had been left by the Goths. A vessel was loaded with costly statues; half the covering of the capitol, which was of brass plated over with gold; sacred vessels enriched with precious stones; and those which had been taken by Titus out of the temple of Jerusalem; all of which were lost with the vessel in its passage to Africa.

MARJORIANUS.—Nothing could now be more deplorable than the state of the Roman affairs; nevertheless, the Western empire continued to exist for some few years; and even seemed to revive for a little under Marjorianus, who was declared emperor in 458. He was a man of great courage, and possessed of many other excellent qualities. He defeated the Vandals, and drove them out of Italy. With great labor he fitted out a fleet, of which the Romans had been long destitute. With this he designed to pass over into Africa; but, it being surprised and burnt by the enemy, he himself was soon after murdered by one Ricimer, a Goth, who had long governed every thing with an absolute sway. After the death of Marjorianus, Athemius was raised to the empire: but, beginning to counteract Ricimer, the latter openly revolted, and besieged and took Rome; where he committed innumerable cruelties, among the rest putting to death the emperor Anthemius, and raising one Olybius to the empire.

The transactions of Olybius's reign were very few, as he died soon after his accession. On his death Glycerius usurped the empire. He was deposed in 474, and Julius Nepos had the name of emperor. He was driven out the next year by his general Orestes, who caused his son Romulus Augustulus to be proclaimed emperor. But the following year, 476, the barbarians who served in the Roman armies, and were distinguished with the title of allies, demanded, as a reward for their services, the third part of the lands in Italy; pretending that the whole country, which they had so often defended, belonged of right to them. As Orestes refused to comply with this insolent demand, they resolved to do themselves justice, as they called it; and, openly revolting, chose one Odoacer for their leader. Odoacer was, according to Ennodius, meanly born, and only a private man in the guards of the emperor Augustulus, when the barbarians, revolting, chose him for their leader. However he is said to have been a man of uncommon ability. He marched against Orestes and his son Augustulus, who still refused to give them any share of the lands in Italy. As the Roman troops were inferior, both in number and valor, to the barbarians, Orestes took refuge in Pavia, at that time one of the best fortified cities in

Italy; but Odoacer, investing the place without loss of time, took it soon after by assault, gave it up to be plundered by the soldiers, and then set fire to it. Orestes being taken prisoner, and brought to Odoacer, he carried him to Placentia, and there caused him to be put to death on the 28th of August, the day on which he had driven Nepos out of Ravenna, and obliged him to abandon the empire. From Placentia Odoacer marched straight to Ravenna, where he found Paul, the brother of Orestes, and the young emperor Augustulus. The former he immediately put to death; but sparing Augustulus, in consideration of his youth, he stripped him of the ensigns of the imperial dignity, and confined him to Lucullanum, a castle in Campania; where he was treated with great humanity, and allowed a handsome maintenance. Rome readily submitted to the conqueror, who immediately caused himself to be proclaimed king of Italy, but would not assume the purple. Thus failed the very name of an empire in the west. Britain had been long abandoned by the Romans; Spain was held by the Goths and Suevans; Africa by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected several tetrarchies in Gaul; at length Italy itself, with its proud metropolis, which for so many ages had given law to the rest of the world, was enslaved by a contemptible barbarian, whose family, country, and nation, are not well known to this day.

PART V.

EASTERN, OR CONSTANTINOPOLITAN EMPIRE.

From the death of Theodosius to the time when the Roman empire in the west was totally destroyed by the Goths, we find little remarkable in the history of Constantinople; or during the reigns of Theodosius II., Marcian and Leo I. and II., except that Leo II., who had been associated by his maternal grandfather, (Leo I.) resigned in favor of his father Zeno, whom he crowned with his own hands. When the western empire ended in Augustulus, the Eastern was usurped by Basiliscus, who had driven out Zeno the lawful emperor. Zeno fled into Isauria, where he was pursued by Illus and Trecondes, two of the usurper's generals; who, having easily defeated the few troops he had with him, forced the unhappy prince to shut himself up in a castle, which they immediately invested. But in a short time Basiliscus having become obnoxious to the people by his cruelty, avarice, and other bad qualities, his generals joined with Zeno, whom they restored to the throne. After his restoration, Zeno having got Basiliscus into his power, confined him in a castle of Cappadocia, together with his wife Zenonide, where they both perished with hunger and cold, A. D. 478, after Basiliscus had reigned about twenty months. During the time of this usurpation a fire happened at Constantinople, which consumed great part of the city, with the library containing 120,000 volumes; among which were the works of Homer, written, it is said, on the great gut of a dragon

120 feet long. Zeno was not improved by his misfortunes. He still continued the same vicious courses which had given occasion to the usurpation of Basiliscus; yet, though other conspiracies were formed against him, he had the good fortune to escape them. He engaged in a war with the Ostrogoths, in which he proved unsuccessful, and was obliged to yield the provinces of Lower Dacia and Mesia to them. In 484 Theodoric, their king, made an irruption into Thrace, and advanced within fifteen miles of Constantinople; but the following year they retired in order to attack Odoacer king of Italy, of which country Theodoric was proclaimed king in 493. The emperor Zeno died in 491, in the sixty-fifth year of his age, and seventeenth of his reign. The Roman empire had long been on the decline, before it fell a prey to the Goths. The ancient valor and military discipline, which had rendered the Romans superior to other nations, had now greatly degenerated. But what proved of the greatest detriment was the allowing vast swarms of barbarians to settle in the different provinces, and to serve in the empire in separate and independent bodies. This had proved the immediate cause of the dissolution of the western empire; but, as it affected the eastern parts less, the Constantinopolitan empire continued for near 1000 years after the western was totally dissolved. The weak administrations of Zeno, and Anastasius I., who succeeded him, rapidly reduced the eastern empire; and it might possibly have fallen soon after the western one, had not the wise and vigorous conduct of Justin, and his partner Justinian, revived in some measure the ancient martial spirit. Justin ascended the throne in 518. In 521 he engaged in a war with the Persians, who had long been very formidable enemies. Against them he employed the famous Belisarius; but nothing remarkable happened till after the accession of Justinian.

JUSTINIAN I.—This prince was the nephew of Justin, and was by him taken as his partner in the empire in 527; the same year Justin died, in the seventy-seventh year of his age, and ninth of his reign. Justinian, being now sole master of the empire, bent his whole force against the Persians. The latter proved successful in the first engagement; but were soon after utterly defeated by Belisarius on the frontiers of Persia, and by Dorotheus in Armenia. The war continued with various success during the first five years of Justinian's reign. In the sixth a peace was concluded, stipulating, 1. That the emperor should pay the king of Persia 1000 lbs. weight of gold. 2. That both princes should restore the places they had taken during the wars. 3. That the commander of the Roman forces should no longer reside at Daras, on the Persian frontiers, but at Constantina in Mesopotamia. 4. That the Iberians, who had sided with the emperor, should be at liberty to return to their own country or stay at Constantinople. This peace, concluded in 532, was styled eternal; but proved of very short duration.

About this time happened at Constantinople one of the greatest civic tumults recorded in history. It began among the different factions in the circus, but ended in an open rebellion. The

people, highly dissatisfied with the conduct of John the præfectus prætorii, and of Trebonianus then questor, forced Hypatius, nephew to the emperor Anastasius, to accept the empire, and proclaimed him with great solemnity. As these two ministers were greatly abhorred on account of their avarice, Justinian immediately discharged them, hoping thus to appease the tumult; but this was so far from answering the purpose that the people only grew more outrageous; and, most of the senators joining them, the emperor was so much alarmed that he had thoughts of abandoning the city. But the empress Theodora persuaded him rather to part with his life than his empire, and he resolved to defend himself to the utmost. In the mean time the rebels, having attempted in vain to force the gates of the palace, carried Hypatius in triumph to the circus, where, while he was beholding the sports from the imperial throne, amidst the shouts and acclamations of the people, Belisarius, who had been recalled from Persia, entered the city with a considerable body of troops. Being now apprised of the usurpation of Hypatius, he marched strait to the circus; fell sword in hand upon the disarmed multitude; and, with the assistance of a band of Heruli, headed by Mundus, governor of Illyricum, cut about 30,000 of them in pieces. Hypatius the usurper, and Pompeius, another nephew of Anastasius, were taken prisoners, and carried to the emperor, by whose orders they were both beheaded, and their bodies cast into the sea. Their estates were confiscated with those of such senators as had joined with them; but the emperor caused great part of their lands and effects to be afterwards restored, together with their honors and dignities, to their children. Justinian, having now no other enemy to contend with, turned his arms against the Vandals in Africa, and the Goths in Italy; both which provinces he recovered out of the hands of the barbarians. But before Belisarius had time to re-establish fully the Roman power in Italy, he was recalled to carry on the war against Cosroes king of Persia, who, regardless of the late treaty, entered the Roman dominions at the head of a powerful army. The same year a new peace was concluded upon the following conditions:— 1. That the Romans should, within two months, pay to the Persian king 5000 lbs. weight of gold, and an annual pension of 500 lbs. 2. That the latter should relinquish all claim to the fortress of Daras, and maintain a body of troops to guard the Caspian gates, and prevent the barbarians from breaking into the empire. 3. That upon payment of that sum Cosroes should immediately withdraw his troops from the Roman dominions. The treaty being signed, and the stipulated sum paid, Cosroes began to march back again; but by the way plundered several cities. Justinian hereupon resolved to renew the war with vigor; but had scarcely for that purpose despatched Belisarius into the east before he was obliged to recal him, in order to oppose the Goths, who had gained great advantages in Italy. The Persian war was carried on with indifferent success till A. D. 538, when a peace was concluded, upon the emperor again paying an immense sum to the enemy. The same year

the Huns, passing the Danube in the depth of winter, marched in two bodies for Constantinople; and, laying waste the countries through which they passed, came, without opposition, within 150 furlongs of the city. But Belisarius, marching out against them with a handful of men, put them to flight; the emperor, however, agreed to pay them an annual tribute, upon their promising to defend the empire against all other barbarians. This was the last exploit performed by Belisarius, who, on his return to Constantinople, was disgraced, stripped of his employments, and confined to his house, on pretence of a conspiracy. See BELISARIUS. In 565 a real conspiracy was formed against Justinian, which he happily escaped, and the conspirators were executed; but the emperor did not long survive, being carried off by a natural death in 556, in the thirty-ninth year of his reign.

JUSTINIAN'S SUCCESSORS, TO THE FIRST TURKISH INVASION.—During the reign of Justinian the majesty of the Roman empire seemed to revive. He recovered the provinces of Italy and Africa out of the hands of the barbarians, by whom they had been held for a number of years; but after his death they were soon lost, and the empire tended fast to dissolution. In 569 Italy was conquered by the Lombards, who held it for the space of 200 years. Some amends, however, were made for this loss by the acquisition of Persian Armenia, the inhabitants of which being persecuted on account of the Christian religion, which they professed, revolted to the Romans. This produced a war between the two nations, who continued to weaken each other, till at last the Persian monarchy was overthrown, and that of the Romans greatly reduced by the Saracens. These new enemies attacked the Romans in 632, and pursued their conquests with incredible rapidity. Within four years they reduced Egypt, Syria, and Palestine. In 648 they became masters of Mesopotamia, Phenicia, Africa, Cyprus, Aradus, and Rhodes; and having defeated the Roman fleet, commanded by the emperor Constant II. in person, they concluded a peace on condition of keeping the vast extent of territory they had seized, and paying for 1000 mummia-year. An expedition against the Lombards was about this time undertaken, but with very little success, a body of 20,000 Romans being almost entirely cut off by one of the Lombard generals. In 671 the Saracens ravaged several provinces, made a descent in Sicily, took and plundered the city of Syracuse, and overran the whole island, destroying every thing with fire and sword. In like manner they laid waste Cilicia; and, having passed the winter at Smyrna, entered Thrace in the winter of 672, and laid siege to Constantinople itself. Here, however, they were repulsed with great loss: but next spring they renewed their attempt, in which they met with the same bad success: many of their ships being burnt by the sea fire, as it was called, because it burnt under water; and in their return home their fleet was wrecked off the Scyllæan promontory. At last a peace was concluded for thirty years, on condition that the Saracens should retain all the provinces they had seized; and that they should pay to the emperor and his

successors 3000 pounds weight of gold, fifty slaves, and as many choice horses. This peace was scarcely concluded when the empire was invaded by the Bulgarians; who, breaking into Thrace, defeated the Roman army, and ravaged the country far and wide. Constantine IV., in 678, agreed to pay them an annual pension, rather than continue a doubtful war; and allowed them to settle in Lower Mæsia, from them called Bulgaria.

In 687 they were attacked by Justinian II., who entered their country without provocation; but they, falling suddenly upon him, drove him out, and obliged him to restore the towns and captives he had taken. In 697 Justinian was deposed; and in his exile fled to Trebelis, king of the Bulgarians, by whose aid he was restored to his throne; but, soon forgetting this favor, he invaded the country of the Bulgarians, with a design to wrest from them those provinces which he had yielded to them. In this expedition he was attended by no better success than his ingratitude deserved, his army being defeated, and himself obliged to make his escape in a vessel to Constantinople. The Bulgarians, continuing their inroads and ravages at different times, generally defeated the Romans who ventured to oppose them, till A.D. 800, the seventh of the reign of Nicephorus I., when they surprised the city of Sardica, and put the whole garrison, consisting of 6000 men, to the sword. The emperor marched against them with a considerable army; but the enemy retired at his approach; and he, instead of pursuing them, returned to Constantinople. Two years after he entered Bulgaria at the head of a powerful army, destroying every thing with fire and sword. The king offered to conclude a peace with him upon honorable terms; but Nicephorus, rejecting his proposals, continued to waste the country, destroying the cities, and putting all the inhabitants, without distinction of sex or age, to the sword. The king was so much affected with these cruelties, that he sent a second embassy to Nicephorus, offering to conclude a peace with him upon any terms. But, Nicephorus dismissing the ambassadors with scorn, the Bulgarian monarch attacked the Roman camp, forced it, and cut off almost the whole army, with the emperor himself, and a great number of patricians. His successor, Michael I., likewise engaged in a war with the Bulgarians; but, being utterly defeated, resigned the empire. After this the Bulgarians continued to be very formidable enemies till the year 979, when they were vigorously attacked by Basilus II. The Bulgarians were now governed by a king named Samuel; who having ravaged the Roman territories, Basilus sent against him Nicephorus Uranus at the head of a powerful army. Uranus, leaving his baggage at Larissa, reached by long marches the Sperchius, and encamped with his whole army over against the enemy, who lay on the opposite bank. As the river was greatly swelled, with the heavy rains that had lately fallen, Samuel, not imagining the Romans would attempt to pass it, suffered his troops to roam in large parties about the country. But Uranus, having at length found out a place where the river was fordable, passed it in the night, fell

upon the Bulgarians, who lay for the most part asleep: cutting great numbers in pieces, and making himself master of their camp. Samuel and his son were dangerously wounded; and would have been taken, had they not concealed themselves among the dead. The next night they stole away to the mountains of Ætolia. The following year the emperor entered Bulgaria at the head of a numerous and well disciplined army; defeated Samuel in a pitched battle, and took several strong cities. The emperor himself, however, at last, narrowly escaped being cut off in a narrow pass. From this danger he was relieved by the arrival of Nicephorus Xiphias, governor of Philippopolis, with a body of troops; who, falling upon the enemy's rear, put them to flight. Basilus pursued them close; and, having taken an incredible number of captives, caused their eyes to be pulled out, leaving to every hundred a guide with one eye, that he might conduct them to Samuel. This shocking spectacle so affected the king that he fell into a deep swoon, and died two days after. The emperor, pursuing his conquests, in the space of two years made himself master of most of the enemy's strong holds. He defeated also the successor of Samuel in several engagements; and, having at last killed him in battle, the Bulgarians submitted without reserve. The vast treasures of these princes were by Basilus distributed among his soldiers. Soon after the royal family surrendered themselves to the emperor, by whom they were received with the utmost respect. Ibatzes, however, a person nearly allied to the family, who had distinguished himself in an eminent manner during the whole course of the war, refused to submit. At last Eustathius Daphnomelus, whom Basilus had lately appointed governor of Achridus, the chief city of Bulgaria, undertook to secure him. Without communicating his design to any, he repaired, with two persons in whom he could confide, to the mountain on which Ibatzes had fortified himself. He hoped to pass undiscovered among the many strangers who flocked thither to celebrate the approaching feast of the Virgin, for whom Ibatzes had a great veneration. In this he found himself mistaken; for he was known by the guards, and carried before the prince. To him he pretended to have something of importance to communicate; but, as soon as Ibatzes had retired with him into a remote place, Daphnomelus threw himself suddenly upon him, and with the assistance of the two men whom he had brought with him, put out his eyes; and got safe to an abandoned castle on the top of the hill. Here they were immediately surrounded by the troops of Ibatzes; but Daphnomelus exhorting them now to submit to the emperor, by whom he assured them they would be well received, they congratulated Daphnomelus on his success, and suffered him to conduct the unhappy Ibatzes a prisoner to Basilus. The emperor was no less surprised than pleased at the success of this bold attempt; and rewarded Daphnomelus with the government of Dyrrhachium, and all the rich moveables of his prisoner. After this, having accomplished the entire reduction of Bulgaria, he returned to Constantinople with an incredible number of captives. All this time the Saracens

had at intervals invaded the Roman dominions, and even attempted to make themselves masters of the capital. Their internal divisions, however, rendered them now much less formidable enemies than they had formerly been; so that some provinces were recovered for a time out of their hands. In 1040 the empire was first invaded by the Turks; an enemy who, though not very powerful at that time, by degrees gathered strength sufficient to overthrow both the Roman and Saracen empires. See **TURKEY**. Cutlu-Moses, nephew to Tangrolipix, the Turkish sultan, having been refused a passage through Media, in his retreat from Arabia, by Stephen the Roman governor, forced his passage and defeated the Roman army with so much ease that he told his uncle the province might be easily conquered. Tangrolipix accordingly sent Asan, another nephew, with an army of 20,000 men, to reduce Media. The young prince entered that country, and committed every where dreadful ravages; but, being drawn into an ambush by the Roman generals, he was cut off with his whole army. Tangrolipix, not discouraged, sent a new army into Media of nearly 100,000 men, who, after having ravaged the country without opposition, laid siege to Artza, a place of great trade. Not being able to reduce it by any other means they set it on fire; and 150,000 of the inhabitants perished either by the flames or the sword. After this Abraham Halim, half brother to Tangrolipix, hearing that the Romans, reinforced with a body of troops under Liparites governor of Iberia, had taken the field, marched against them, and the two armies engaged with incredible fury. The victory continued long doubtful; but at length inclined to the Romans, who nevertheless did not think proper to pursue the fugitives, as their general Liparites was taken prisoner. The emperor despatched ambassadors with rich presents, and a large sum of money to redeem him, and at the same time to conclude an alliance with Tangrolipix. The presents the sultan received; but immediately returned them together with the money to Liparites, whom he set at liberty without ransom. Not long after Tangrolipix sent an ambassador to Constantinople: who having exhorted the emperor to submit to his master, and acknowledge himself his tributary, was ignominiously driven out of the city. Tangrolipix, highly affronted at this, entered Iberia, while the emperor Constantine Monomachus was engaged in a war with the Patzinacæ, a Scythian nation. Having ravaged that country, he returned to Media, and laid siege for forty days to Mantzichiarta, a place defended by a numerous garrison. The next spring Tangrolipix returned, and ravaged Iberia with the utmost cruelty, sparing neither sex nor age. But, on the approach of the Roman army, he retired to Tauris, leaving 30,000 men on the frontiers of the empire. Till the time of this emperor the provinces bordering on the countries of the barbarians had maintained, at their own charge, forces to defend them: and were on that account exempted from paying tribute; but, as Monomachus exacted from them the same sums that were paid by others, they were no longer in a condition to defend themselves.

FROM CONSTANTINE DUCAS TO THE CAPTURE OF CONSTANTINOPLE BY THE LATINS.—In 1067 died the emperor Constantine Ducas, having left the empire to his three sons, Michael, Andronicus, and Constantine; but, as they were all very young, he appointed the empress Eudocia regent, after having required of her an oath never to marry. He likewise obliged the senators solemnly to swear that they would acknowledge none for their sovereign but his three sons. No sooner, however, was he dead than the Turks, hearing that the empire was governed by a woman, broke into Mesopotamia, Cilicia, and Cappadocia. The empress was now in a condition to oppose them, the greater part of the army having been disbanded in her husband's life-time; and a discontented party existed at home, who observed that the state of affairs required a man of courage and address at the helm, instead of a weak woman. Eudocia therefore determined to marry some person of merit, capable of defeating her enemies; and when one Romanus Diogenes, a man of illustrious birth and beautiful person, was brought forth to receive sentence of death, she only gently upbraided him with his ambition and set him at liberty. Soon after she appointed him commander-in-chief of her forces. In this station he acquitted himself so well that the empress resolved to marry him if she could recover the writing in which her oath was contained out of the hands of the patriarch. In order to this she applied to a favorite eunuch; who told the patriarch that the empress was so taken with his nephew Bardas, that she was determined to marry and raise him to the empire, provided the patriarch absolved her from her oath, and convinced the senate of the lawfulness of her marriage. The patriarch, dazzled with the prospect of his nephew's promotion, readily undertook to perform both. He first obtained the consent of the senate, by representing to them the dangerous state of the empire, and exclaiming against the rash oath which the jealousy of the late emperor had extorted from the empress. He then publicly discharged her from it, and restored the writing to her, exhorting her to marry some deserving object, who, being entrusted with an absolute authority, might be capable of defending the empire. Thus discharged from her oath, the empress, a few days after, married Romanus Diogenes. Being a man of great activity and military talent, he took the command of the army, and passed over into Asia, recruiting and inuring his forces on his march to military discipline. On his arrival, being informed that the Turks had surprised and plundered Neocæsarea, and were retiring with their booty, he hastened after, and came up with them on the third day, when he cut off great numbers of them, and easily recovered the booty. After this he pursued his march to Aleppo, which he retook, together with Hierapolis, where he built a strong castle. In his return, he was met by a numerous body of Turks, who attempted to cut off his retreat; and he pretended to decline an engagement through fear; but attacked them afterwards with such vigor that he put them to flight at the first onset. After this several towns submitted to him; but, the season

being spent, he returned to Constantinople. The following year he passed over into Asia in the spring; and, being informed that the Turks had sacked Iconium, marched at once against them; when they retired in great haste. The Armenians, however, encouraged by the approach of the emperor's army, fell upon them in the plains of Tarsus, put them to flight, and stripped them both of their baggage and booty. The spring following the emperor once more entered Asia at the head of a considerable army. When the two armies drew near each other, Axan, the Turkish sultan, son of the famous Tangrothipax, sent proposals to Romanus for a peace. These were imprudently rejected, and a desperate engagement ensued; when, in spite of the utmost efforts of the emperor, his army was routed, and he himself wounded and taken prisoner. When this news was brought to Axan, he could scarcely believe it; but, being convinced by the appearance of the royal captive in his presence, he tenderly embraced and consoled him. 'You shall have no occasion,' said he, 'to complain of your captivity: I will not use you as my prisoner, but as an emperor.' The Turk was as good as his word. He lodged Romanus in a royal pavilion; assigned him attendants, with an equipage suitable to his quality; and discharged such prisoners as he desired. After he had for some days entertained his captive with extraordinary magnificence, a perpetual peace was concluded, and the emperor dismissed with the greatest marks of honor. He then set out with the Turkish ambassador for Constantinople, where the peace was to be ratified; but by the way he was informed that Eudocia had been driven from the throne by John the brother or Constantine Ducas, and Psellus a leading man in the senate, who had confined her to a monastery, and proclaimed Michael Ducas, his eldest son, emperor. On this intelligence Romanus retired to a strong castle near Theodosiopolis, where he hoped soon to be joined by his friends and adherents. But John, who had taken upon him to act as guardian to the young prince, sent Andronicus with a considerable army against him; on which he was obliged to fly to Adana, in Cilicia, where he was closely besieged, and at last compelled to surrender. Andronicus carried his prisoner into Phrygia, where he fell dangerously ill, being, as was suspected, secretly poisoned. Here, at any rate, John ordered his eyes to be put out; which was done with such cruelty that he died soon after, in 1071, having reigned three years and eight months.

Axan was no sooner informed of the tragical end of his friend and ally than he resolved to invade the empire; and that not only with a design to plunder as formerly, but to conquer, and keep what he conquered. The emperor despatched against him Isaac Comnenus, with a considerable army; but he was defeated and taken prisoner by Axan. Another army was sent off under John Ducas, the emperor's uncle, who gained some advantages; but one Urselius revolted with the troops under his command, caused himself to be proclaimed emperor, and reduced several cities in Phrygia and Cappadocia. Against him John marched with all his

forces, suffering the Turks in the mean time to pursue their conquests; but, coming to an engagement with the rebels, his army was entirely defeated, and himself taken prisoner. Notwithstanding this victory, Urselius was so much alarmed at the progress of the Turks that he not only released his prisoner, but joined with him against the common enemy, by whom they were both defeated and taken prisoners. Axan, however, was now prevented from pursuing his conquests by Cutlu-Moses, nephew to the late Tangrolipix. He had revolted against his uncle; but, being defeated by him in a pitched battle, had taken refuge in Arabia, whence he returned at the head of a considerable army to dispute the sovereignty. But, while the two armies were preparing to engage, the khalif of Babylon interposed his authority, and, by his mediation, an agreement was concluded that Axan should enjoy undisturbed the monarchy lately left him by his father, and that Cutlu-Moses should possess such provinces of the Roman empire as he or his sons should conquer. Both the Turkish princes thus turned their forces against the empire; and, before 1077, made themselves masters of Media, Lycaonia, Cappadocia, and Bithynia, fixing their capital at Nice. During all this time the emperors of Constantinople, as well as their subjects, seemed to be in a manner infatuated. They took no notice of the great progress of these barbarians: the generals were ambitious only of seizing the tottering empire; and, after it was obtained, spent their time in oppressing their subjects, rather than in attempting to repulse the enemy. At last Alexius Comnenus, having wrested the empire from Nicephorus Botoniaties, in 1080, began to prepare for opposing so formidable an enemy with vigor; so that Solymán, the Turkish sultan, son and successor to Cutlu-Moses, despatched ambassadors with proposals of peace. These were at first rejected; but Alexius was at last glad to accept them, on hearing that Robert Guiscard, duke of Puglia and Calabria, was making great preparations against him in the west. To this expedition Robert was incited by Michael Ducas. That prince had been deposed by Nicephorus Botoniaties, and towards the end of the usurper's reign fled into the West, where he was received by Robert, who sailed with all his forces from Brundisium; and, landing at Butthrotum in Epirus, made himself master of that place, while his son Bohemond with part of the army reduced Aulon, a celebrated city of Albania. Thence they advanced to Dyrrhachium, which they invested both by sea and land; but met with a most vigorous opposition from George Palæologus, whom the emperor had entrusted with the defence of it. In spite of the utmost efforts of the enemy, this commander held out till the arrival of the Venetian fleet, by whom Robert's navy commanded by Bohemond was totally defeated, the admiral himself having narrowly escaped. After this victory the Venetians landed; and, being joined by Palæologus's men, fell upon Robert's troops with such fury that they destroyed their works, burnt their engines, and forced them back to their camp. As the Venetians were now masters at sea, the besieged were supplied with

plenty of provisions, while a famine began to rage in the camp of the enemy: a calamity soon followed by a plague, which in three months is said to have destroyed 10,000 men. Robert, however, did not abandon the siege, but pushed it with such vigor that the courage of the besieged began to fail; and Palæologus sent repeated messages to the emperor, stating that he should be obliged to surrender. On this Alexius marched in person to the relief of the city, but was defeated with great loss by Robert. The emperor himself with great difficulty made his escape, leaving the enemy master of his camp. Soon after this defeat the city surrendered; and Alexius, being destitute of resources, seized on the wealth of the churches and monasteries, which gave much offence to the clergy, and had nearly occasioned great disturbances in Constantinople. At the same time, entering into an alliance with Henry emperor of Germany, he persuaded him to invade the dominions of Robert in Italy. At first Henry met with great success; but was soon overcome and driven out by Robert. Bohemond, in the mean time, reduced several places in Illyricum; and, having defeated Alexius in two pitched battles, entered Thessaly, and set down before Larissa, till the emperor came to its relief. Soon after his arrival he drew a strong party of Bohemond's men into an ambuscade, and cut them almost all off. However, in a battle which was fought a few days after, Bohemond had the advantage; but his troops mutinying he was obliged to return to Italy. Alexius in his absence recovered several cities; and applied once more to the Venetians. By them he was assisted with a powerful fleet, which defeated that of Robert in two engagements; but being soon after surprised they were defeated with the loss of almost all their navy. Robert is said to have used his victory with great barbarity. The Venetians now equipped a second fleet; and, joining that of the emperor, fell unexpectedly upon Robert's navy in Butthrotum, sunk most of his ships, and took a great number of prisoners. Robert, while making preparations to revenge this defeat, was prevented by death; and his son Roger did not think proper to pursue so expensive a war.

This conflict was scarcely ended when the Scythians, passing the Danube, laid waste great part of Thrace, committing every where the greatest barbarities. Against them the emperor despatched an army under the command of Pacurianus and Branas. The latter enraged the enemy contrary to the opinion of his colleague; and his rashness caused the loss of the greater part of the army, who were cut off by the Scythians, together with two generals. On this Talicius, an officer who had signalled himself on many occasions, was appointed to the command. He fell upon the enemy as they lay securely near Philippopolis, cut off great numbers of them, and obliged the rest to retire in confusion. Next spring, however, they returned in such numbers that the emperor resolved to march against them in person. Accordingly he set out for Adrianople, and thence to Lardea. Here, contrary to the advice of his best officers, he ventured a battle; in which he was totally defeated with the loss of vast

numbers of men, he himself escaping with difficulty. The next year he was attended with no better success, his army being entirely defeated with the loss of his camp and baggage. But in 1084 he retrieved his credit; and gave the Scythians such an overthrow that very few escaped. Notwithstanding they again invaded the empire in 1093. To this they were encouraged by an impostor called Leo, who pretended to be the eldest son of Romanus Diogenes. The young prince had been slain in a battle with the Turks; but the Scythians only wanted a pretence to renew the war. By a stratagem, however, Leo was murdered; and the Scythians, being afterwards overthrown in two great battles, were obliged to submit on the emperor's own terms. From 1083 the war had been carried on with the Turks with various success; but now an association was formed in the west against these infidels. This was occasioned by the superstition of the Christians, who now meditated a crusade for the recovery of the Holy Land. Had the western princes been assisted by the emperor of the east in this undertaking, the Turks had undoubtedly, been unable to resist them; but the Latins were looked upon by them as no less enemies than the Turks; and indeed whatever places they took from the infidels they never thought of restoring to the emperors of Constantinople, but erected a number of small independent principalities; which neither having sufficient strength to defend themselves, nor being properly supported by one another, soon became a prey to the Turks. In 1203 happened a dreadful fire at Constantinople, occasioned by some Latin soldiers having plundered a mosque which the Turks had been suffered to build. For this reason they were attacked by the infidels; who being much superior to them in number, the Latins were obliged to set fire to some houses to make their escape. The flame, spreading in an instant from street to street, reduced great part of the city to ashes. The emperor Isaac Angelus, who had been restored to his throne by the Latins, died soon after their departure from Constantinople, leaving his son Alexius sole master of the empire. The young prince, to discharge the large sums he had promised to the French and Venetians for their assistance, was obliged to lay heavy taxes on his subjects; and this, with the great esteem and friendship he showed to his deliverers, raised a general discontent among the inhabitants of Constantinople, who were sworn enemies to the Latins. This encouraged John Ducas (surnamed Murtzuphlus from his joined and thick eyebrows) to attempt the sovereignty. Unhappily he found means to put his treacherous designs in execution, and strangled the young prince with his own hands. After this he presented himself to the people; told them what he had done, which he pretended was to secure their liberties; and earnestly entreated them to choose an emperor who had courage to defend them against the Latins. On this he was instantly saluted emperor, but his usurpation proved the ruin of the city. The Latins resolved immediately to revenge the death of the young prince; and, as they had been so often betrayed and retarded in their expeditions

to the Holy Land by the emperors of Constantinople, to make themselves masters of that city, and seize the empire. Accordingly they mustered all their forces in Asia, and, having crossed the straits, laid siege to Constantinople by sea and land. The tyrant, who was a man of great courage and experience, made a vigorous defence. The Latins, however, after having battered the walls for several days together with an incredible number of engines, made a general assault on the 8th of April 1204. The attack lasted from break of day till 3 P. M., when they were forced to retire, after having lost some of their engines, and a great number of men. The assault was nevertheless renewed four days after; when, after a warm dispute, the French planted their standard on one of the towers; which the Venetians observing, they quickly made themselves masters of four other towers, where they likewise displayed their ensigns. In the mean time three of the gates being broke down by the battering rams, and those who had scaled the walls having killed the guards and opened the gates, the whole army entered. The Greeks fled in the greatest confusion; and several parties of the Latins scouring the streets put all they met to the sword. Night put a stop to the dreadful slaughter, and next morning the Greeks entirely submitted; at the same time they were ordered to retire to their houses, the city being given up to be plundered by the soldiers. The Latins strictly enjoined their men to abstain from slaughter, to preserve the honor of the women, and to bring the whole booty into one place, that a just distribution might be made: but the Greeks had concealed their most valuable effects during the night; and many persons of the first rank had escaped, and carried along with them immense treasures. Yet the booty, without the statues, pictures, and jewels, amounted to a sum almost incredible. As for Murtzuphlus he made his escape in the night; embarking in a small vessel with Euphrosyne, the wife of Alexius Angelus a late usurper, and her daughter Eudoxia, for whose sake he had abandoned his wife.

FINAL DOWNFALL OF THE EASTERN EMPIRE.—Constantinople continued subject to the Latins for fifty-six years, from A. D. 1205 till 1261: during which period Baldwin, earl of Flanders, Henry his brother, Peter de Courtenay, Robert, and Baldwin II. reigned successively as emperors. This last had reigned thirty-two years, when the Latins were expelled by Alexius Strategopulus, a person of illustrious family, and for his eminent services distinguished with the title of Cæsar. He had been sent against Alexius Angelus despot of Epirus, who now attempted to recover some places in Thessaly and Greece, from Michael Palæologus, one of the Greek emperors, who, since the capture of Constantinople, had kept their court at Nice: and to try whether he could on his march surprise the imperial city. Alexius, having passed the straits, encamped at a place called Rhégium, where he was informed by the natives that a strong body of the Latins had been sent to the siege of Daphuksa, that the garrison was in great want of provisions, and that it would be easy to surprise Constantinople. Hereupon the Greek general resolved at all

events to attempt it; in which he was encouraged by some of the inhabitants, who, coming privately to his camp, offered to be his guides. He approached in the night, and some of his men scaled the walls without being observed; when, killing the sentries, they opened the gates to the rest of the army. The Greeks, rushing in, put all they met to the sword; and, to create more terror, set fire to the city in four different places. The Latins, concluding from this that the enemy's forces were far more numerous than they really were, did not so much as attempt either to drive them out, or to extinguish the flames. In this general confusion Baldwin, quitting the ensigns of majesty, fled with Justinian the Latin patriarch, and some of his friends, to the sea-side; where, embarking in a small vessel, he sailed to Eubœa, and afterwards to Venice, leaving the Greeks in full possession of Constantinople. When the news of this surprising and unexpected success was first brought to Michael he could scarcely credit it; but, receiving letters from Alexius himself with a particular account of the event, he ordered thanks to be returned in all the churches, and couriers to be despatched with the agreeable news to all parts of the empire. Soon after he set out for Constantinople with the empress, his family, the senate, and nobility, to take possession of the imperial city. Having passed the straits he advanced to the golden gate, and continued some days without the walls, while the citizens were making the necessary preparations to receive him with suitable magnificence. On the day appointed the golden gate, which had been long shut, was opened, and the emperor entered amidst the acclamations of the multitude to the great palace. He was preceded by the bishop of Cyzicus, who carried an image of the Virgin, and followed by all the great officers, nobility, and chief citizens, pompously dressed. Public thanks were again returned in the church of St. Sophia, at which the emperor assisted in person. After this the emperor carefully surveyed the city, a duty which greatly allayed his joy. He saw the stately palaces and other magnificent buildings of the emperors lying in ruins; many capacious buildings that had been erected by his predecessors, at an immense charge, destroyed by fire, and other accidents of war; several streets abandoned by the inhabitants, and choked up with rubbish, &c. These objects only, however, excited in him a desire of restoring the city. In the mean time, looking upon Alexius as the restorer of his country, he caused him to be clad in magnificent robes; placed with his own hand a crown on his head; ordered him to be conducted through the city in triumph; decreed that, for a whole year, his name should be joined in the public prayers with his own; and commanded his statue to be erected on a stately pillar of marble. His next care was to repeople the city, many Greek families having withdrawn while it was held by the Latins. The former were recalled, and the latter were allowed many privileges to induce them not to remove. Great privileges were likewise granted to the natives of Venice and Pisa, which encouraged them to lay aside all thoughts of removing. Michael, however, being soon after

informed that the *ci-devant* emperor Baldwin II. had married his daughter to Charles king of Sicily, and given him Constantinople by way of dowry, he ordered the Genoese, who were become very numerous, to remove first to Heraclea, and afterwards to Galata. The Pisans and Venetians, who were not so numerous and wealthy, were allowed to continue in the city.

Michael, though he had caused himself to be proclaimed emperor, and was possessed of absolute sovereignty, was as yet only guardian to the young emperor John Lascaris, then about twelve years of age. But having now settled the state, and gained the affections both of natives and foreigners, he began to think of securing himself and his posterity in the empire; and cruelly ordered the eyes of the young prince to be put out. This piece of barbarity involved him in great troubles. The patriarch immediately excommunicated him; and he would probably have been driven from the throne, had he not engaged pope Urban IV. to espouse his cause, by promising to submit himself and his dominions to the Latin church. Thus, indeed, he diverted the foreign storm; but caused fresh domestic disturbances, not only in Constantinople, but throughout the empire. In 1283 Michael VII. died, and was succeeded by his son Andronicus II. His first step was to restore the ancient Greek ceremonies. But he thus involved himself in greater difficulties: though Michael had not been able fully to reconcile his Greek subjects to the Latin ceremonies, yet he had in some degree accomplished his purpose. The Latins had obtained a considerable footing in the city, and defended their ceremonies with great obstinacy; so that the empire was again thrown into a ferment. All this time the Turks had been continuing their encroachments on the empire. They were now, however, very successfully opposed by Constantine the emperor's brother: but his valor rendered him suspected, in consequence of which he was thrown into prison, along with several persons of distinction. On the removal of this great commander, the Turks, under the famous Othoman, made themselves masters of several places in Phrygia, Caria, and Bithynia; and among the rest of the city of Nice. To put a stop to their conquests, the emperor despatched against them Philanthropenus and Libadarius, officers of great experience. The former gained some advantages over the enemy; but, being elated with his success, caused himself to be proclaimed emperor. This rebellion, however, was soon suppressed, Philanthropenus being betrayed by his own men: but the Turks, taking advantage of the subsequent commotions, not only extended their dominions in Asia, but conquered most of the islands in the Mediterranean; and infested the coasts of the empire, to the utter ruin of commerce. From this time the eastern empire tended fast to dissolution. After the revolt of Philanthropenus, the emperor could no longer trust his subjects, and therefore hired the Massagetes: but they were first defeated by his enemies, and afterwards turned their arms against him. He next applied to the Catalans, who behaved in the same manner; and, having ravaged the few places he

had left in Asia, returned into Europe, and called the Turks to their assistance. This happened in 1292, and was the first appearance of the Turks in Europe.

This enterprise, however, was unsuccessful. Having loaded themselves with booty, they offered to depart quietly if they were allowed a safe passage, and ships to transport them to Asia. To this the emperor readily consented, and ordered the vessels to be got ready with all possible expedition. But the Greek officers, observing the immense booty with which they were loaded, resolved to fall upon them in the night, and cut them all off. Of this wretched scheme, however, the Turks got notice, and prepared for their defence. They first surprised a strong castle in the neighbourhood, and then found means to acquaint their countrymen in Asia with their dangerous situation. Their brethren, having crossed the Hellespont in great numbers, ravaged the adjacent country, making excursions to the very gates of Constantinople: at last the emperor determined to march against them with all his forces, the people flocking to him from all quarters. The Turks at first gave themselves over for lost; but finding the Greeks negligent of discipline, they attacked their army unexpectedly, utterly defeated it, and made themselves masters of the camp. After this they continued for two years to ravage Thrace terribly; but at last were defeated, and being afterwards shut up in the Chersonesus, were all cut in pieces or taken. Soon after new commotions took place in this unhappy empire, of which the Turks did not fail to take the advantage. 1327 they made themselves masters of most of the cities on the Mæander; and among the rest of Prusa in Bithynia. The next year, however, Othoman the founder of the Turkish monarchy being dead, the emperor recovered Nice, and some other important places. But these, with Abydus and Nicomedia, were lost in 1328; and in 1330 a peace was concluded upon condition that they should keep all their conquests. This peace they observed no longer than served their own purposes; for new commotions breaking out in the empire, they pursued their conquests, and in 1357 had reduced all Asia. They next passed the Hellespont under Solyman the son of Orchan, the successor of Othoman, and seized a strong castle on the European side. Soon after Orchan died, and was succeeded by Amurath I. He extended the conquests of his predecessors, and in a short time reduced all Thrace, making Adrianople the seat of his empire. Amurath was murdered soon after, and was succeeded by his son Bajazet I., who greatly enlarged his dominions by new conquests. In a short time he reduced Thessaly, Macedon, Phocis, Peloponnesus, Mysia, and Bulgaria, driving out the petty princes who governed them. Elated with his frequent victories, he began to look upon the Greek emperor, Andronicus IV., to whom nothing was now left but the city of Constantinople and the neighbouring country, as his vassal. Accordingly he sent him a haughty message, commanding him to pay a yearly tribute, and send his brother Manuel to attend him in his military expeditions. This demand the emperor

was obliged to comply with, but died soon after in 1387.

Manuel no sooner heard of his brother's death than he hastened to Constantinople, without taking leave of the sultan, or acquainting him with the reasons of his sudden departure. At this Bajazet was so offended that he passed with great expedition from Bithynia into Thrace, ravaged the country adjoining to Constantinople, and at last invested the city both by sea and land. In this extremity Manuel had recourse to the western princes; who sent him an army of 130,000 men, under Sigismund king of Hungary, and John count of Nevers. But, though the western troops proved at first successful, they were in the end defeated with great slaughter by Bajazet. As he found, however, that the citizens were determined to hold out to the last, he applied to John, the son of Andronicus IV. who had a better title to the crown than Manuel. With him he entered into a private agreement, by which Bajazet was to place John upon the Constantinopolitan throne, while John was to deliver up the city to the Turks, and remove the imperial seat to the Peloponnesus. At the same time he sent deputies to the inhabitants of Constantinople, offering to withdraw his army, and cease from further hostilities, provided they expelled Manuel and placed John upon the throne. This proposal rent the city into factions; but Manuel prevented the mischiefs which were ready to ensue by a voluntary resignation; and, having conducted John to the palace, set sail for Venice. Thence he went to the courts of all the western princes to solicit their assistance against the Turks. He was every where received with the greatest demonstrations of esteem, and promised large supplies, all Christendom being now alarmed at the progress of the infidels. In the mean time Bajazet did not fail to put John in mind of his promise; but, the citizens refusing to comply with such a scandalous treaty, the siege was renewed, and the city assaulted with more fury than ever. When it was already reduced to the last extremity, tidings were brought to the sultan that Tamerlane, the victorious Tartar, having over-run all the east with incredible celerity, had now turned his arms against the Turks, and was preparing to break into Syria. Alarmed at the danger that threatened him, Bajazet raised the siege in great haste, and advanced against Tamerlane with a numerous and well disciplined army; but the Tartars totally defeated and took him prisoner, after having cut most of his men in pieces. Thus Constantinople was preserved for the present. But this relief was of short duration. In 1424, in the reign of John V., the son of Manuel, the city was besieged by Amurath II. The inhabitants defended themselves with great bravery; but must in the end have submitted, had not the emperor prevailed upon the prince of Caramania to countenance an impostor and pretender to the Turkish throne. This obliged Amurath to raise the siege, and march with all his forces against the usurper. Having then no other enemies, he entered Macedon at the head of a powerful army; and, having ravaged the country far and near, took and plundered Thessalonica, and most of the cities

of Ætolia, Phocis, and Bœotia. From Greece he marched into Servia; reduced the greatest part of it; and besieged the strong city of Belgrade; but here he met with a vigorous repulse, no fewer than 15,000 Turks being slain by the Christians in one sally. In his retreat he was attacked by the celebrated John Hunniades, who cut off great numbers of his men. Not long after he gained a still more complete victory over the enemy in the plains of Transylvania, with the loss of only 3000 of his own men, whereas 20,000 Turks were killed on the field of battle, and almost an equal number in the pursuit. Amurath, who was then at Adrianople, sent an army into Transylvania far more numerous than the former; but they were attended with no better success, being cut off almost to a man by the brave Hungarian. He gained several other victories no less remarkable; but was at last entirely defeated in 1448; and with this defeat ended all hopes of preserving the empire. The unhappy emperor was now obliged to pay an annual tribute of 300,000 aspers to the sultan, and to yield up to him some strong holds on the Euxine. However, as he doubted not but Amurath would soon attempt to become master of the capital, he renewed the union between the Greek and Latin churches, hoping that this would induce the western princes to assist him in the defence of the city. This produced great disturbances, which the emperor did not long survive; as he died in 1448, leaving the empire, now confined within the walls of Constantinople, to his brother Constantine XIII.

Amurath died in 1450, and was succeeded by his son Mohammed II. In the beginning of his reign he entered into an alliance with Constantine, and pretended a great desire to live in friendship with him; but no sooner had he put an end to a war in which he was engaged with Ibrahim king of Caramania, than he built a strong fort on the European side of the Bosphorus, opposite to another in Asia; in both of which he placed garrisons. These two castles commanded the Straits; and the former, being but five miles from the city, kept it in a manner blocked up. This soon produced a misunderstanding between him and the emperor, which ended in the siege of the city. This commenced on the 6th of April, 1453; Mohammed's numerous forces covering the plains before it on the land side, and a fleet of 300 sail blockading it by sea. The emperor, however, had taken care to secure the haven, in which were three large ships, twenty small ones, and a great number of galleys. Mohammed began the siege by planting batteries, and raising works in several places as high as the walls, whence the besieged were incessantly galled with arrows. He had in his camp a piece of ordnance of prodigious size, which is said to have carried a stone ball of 100 lb. With this piece the enemy made several breaches in the walls; which, however, were repaired with incredible expedition. Mohammed, the better to carry on the siege, caused new levies to be made throughout his dominions, by which his army was soon increased to near 400,000 men; while the garrison consisted only of 9000 regular troops, viz. 6000 Greeks and 3000 Ge-

noese and Venetians. As the enemy continued to batter the walls day and night, a great part of them was at last beaten down; while the Turks, however, were busy filling up the ditch, a new wall was built. This threw the tyrant into a prodigious rage, which was greatly heightened when he saw his whole fleet worsted by five ships, of which four were laden with corn from Peloponnesus, and the other with provisions from Chios. These made their way through the Turkish fleet; and, to the great joy of the Christians, got safe into the harbour. The Turks attempted several times to force the haven; but, all their efforts proving ineffectual, Mohammed formed the design of conveying eighty galleys eight miles over land into it. This he accomplished by means of certain engines, the contrivance of a renegado; and, having then either taken or sunk all the Christian ships, he caused a bridge to be built over it with surprising expedition. Thus the city was laid open on that side likewise, and assaulted on all sides. Constantine, now feeling that he could not long hold out against such a mighty and successful enemy, sent deputies to Mohammed, offering to acknowledge himself his vassal, by paying him yearly what tribute he should impose, provided he raised the siege and withdrew. The tyrant answered that he was determined to become master of the city: but if Constantine would deliver it up forthwith, he would yield to him the Peloponnesus, and other provinces to his brothers, which they should enjoy peaceably: but if he held out to the last extremity, and suffered it to be taken by assault, he would put him and the whole nobility to the sword, carry the inhabitants into captivity, and give up the city to plunder. These conditions were rejected by the emperor. The siege was therefore renewed with vigor, and continued till the 25th of May; when a report being spread in the Turkish camp that a large army was advancing to the relief of the city under the celebrated John Hunniades, the soldiers began to mutiny, and pressed Mohammed to raise it. Mohammed was upon the point of complying, when he was advised by Zagan, a Turkish officer of great intrepidity, and an irreconcilable enemy to the Christians, to attempt immediately a general assault. To this he said the soldiers would not be averse, provided the sultan promised to abandon the city to be plundered by them. Mohammed accordingly published a proclamation throughout the camp, declaring that he gave up to his soldiers all the wealth of the opulent capital before them, requiring for himself only the empty houses; and they unanimously desired to be led to the attack. Hereupon Constantine was summoned for the last time to deliver up the city, with a promise of his life and liberty; but to this he answered that he was unalterably determined to defend the city or perish with it. The attack began at three in the morning on the 29th of May; such troops being first employed as the sultan valued least, and designed for no other purpose than to tire the Christians. After the carnage had lasted some hours, the Janissaries and other fresh troops advanced in good order. The Christians making prodigious efforts twice repulsed the enemy:

but being in the end exhausted, they were no longer able to stand their ground; and the enemy broke in several places into the city. In the mean time Justiniani, the commander of the Genoese and a select body of Greeks, having received two wounds, one in the thigh and the other in the hand, was so disheartened that he caused himself to be conveyed to Galata. His men, dismayed at the sudden flight of their general, immediately quitted their posts and fled in the utmost confusion. The emperor, however, attended with a few of the most resolute of the nobility, still kept his post, striving with unparalleled resolution to oppose the multitude of barbarians that now broke in from every quarter. Being in the end overpowered with numbers, and seeing most of his friends fallen around him, 'What!' cried he aloud, 'is there no Christian left alive to strike off my head?' Scarcely had he uttered these words, when one of the enemy, not knowing him, cut him across the face with his sabre; and another coming behind him with a blow on the back part of his head laid him dead on the ground. The few Christians now left alive fled; and the Turks, meeting with no further opposition, entered the city, and put all they met without distinction to the sword. Many thousands took refuge in the church of St. Sophia, but they were all massacred in their asylum. Most of the nobility were, by the sultan's orders, cut off, and the rest kept for purposes more grievous than death. Many of the inhabitants, among whom were some men of great learning, escaped, however, while the Turks were busied in plundering the city. These, embarking in the ships then in the harbour, arrived safe in Italy; where, with the study of the Greek tongue, they revived the liberal sciences, which had long been neglected in the west. After the expiration of three days, Mohammed commanded his soldiers to forbear all farther hostilities on pain of death; and thus put an end to as cruel a pillage and massacre as any recorded in history. The next day he made his triumphal entry into Constantinople, and chose it for the seat of the Turkish empire, which it has continued to be ever since.

PART VI.

ROME, MODERN.

Modern Rome is built chiefly on the left or eastern bank of the Tiber, there being only a few streets on its western side. The walls are of a quadrangular figure, somewhat more than three miles each way, the circuit being in all about thirteen miles. While this is equal to the circumference of ancient Rome in its greatest splendor, there is this distinction perhaps between the ancient and modern city, that of the 'seven hills' on which the former stood, several, viz. Mons Aventinus, Palatinus, Cœlius, and in some degree Mons Esquilinus, Viminalis, and Quirinalis, are covered with vineyards, corn fields, or villas, the closely peopled part being confined to the level ground between the eminences and the river. The length of this part is less than two miles, its breadth from a mile to a mile and a half.

The most regular part of Modern Rome is that adjacent to the north gate, or Porta del Popolo, and the quarter of Borgo, on the right of the river. The points from which it can best be viewed are the Pincian Hill, Mount Janiculum, the tower of the Capitol, and the tops of the columns of Trajan or Antonine.

The streets have seldom any foot pavement; and are in general not wider than those of the older parts of London. Some indeed are wretchedly narrow and irregular, but the houses are not high; and a number of the streets are long and straight, and not unfrequently terminated by an obelisk, fountain, or church. The great drawback on the beauty of the city is the singular discrepancy of its buildings, a mansion entitled to the name of palace being often placed amidst a group of hovels; and the mean appearance of the shops. Three of the finest streets of the city diverge from the Piazza di Popolo, near the northern gate, viz. the Corso, extending to the foot of the Capitol; the Strada del Babuina, ending in the Piazza di Spagna, and the Strada di Ripetta, leading to the Tiber. The Corso is the great public walk, and the crowded scene of the carnival. It is perfectly straight, about a mile in length, and has a foot pavement on each side. Other fine streets are the Strada Felice, the Strada Langara, the Strada Maggiore, and the Strada Pia. The houses are partly of stone and brick, frequently covered with stucco, and generally roofed with shingle. Marble is less common here than in the north of Italy.

The modern squares are numerous, adorned with obelisks, fountains, &c.; but also generally of small size. In front of St. Peter's church is a large oval area form, surrounded with a magnificent colonnade; and in the middle between two fountains stands an Egyptian obelisk, of a single piece of granite, seventy-eight feet in height. The elegant Piazza Navona, a square in the centre of the town, next in size to that of St. Peter, is of an oblong form, and adorned by the church of St. Agnes, but its chief ornament is the fountain in its centre. It consists of a circular basin of seventy-three feet in diameter, in the middle of which stands a rock surmounted by an obelisk; on this rock recline four figures representing four great rivers, from which streams of water issue. This is on the whole the most superb fountain of the city. The Piazza di Spagna, occupied largely by foreigners of distinction, has also a fountain; but its chief ornament is a noble flight of steps that ascend from it to the church and square della Trinita di Monte; the latter extending along the brow of the Pincian Hill, and commanding a delightful view. The Piazza di Monte Cavallo, one of the finest in the city both for its situation and buildings, stands on Mount Quirinal, and takes its name from two marble horses placed on its summit, said to be the work of Phidias and Praxiteles. Between them stands an Egyptian obelisk of granite, forty-five feet in height. Old Intermontium now forms a small square, decorated in the middle with a fine bronze equestrian statue of Marcus Antoninus, accounted a master piece of ancient art. The Campidoglio

Moderno, or Modern Capitol, is ascended by a staircase adorned with statues: but all the statues of the forum have disappeared; and a few scattered porticoes, with here and there an insulated column, fragments of marble, capitals, and cornices, are now its only memorials. The Piazza di Campo Marzio, taking its name from the Campus Martius, is in a great measure covered with buildings.

The ancient wall of Rome is in many places in good preservation; and among the ancient edifices the Pantheon and Coliseum are still conspicuous. For the present state and history of the latter see our article AMPHITHEATRE. At a short distance from it, near the Viminal and Quirinal hills, stands a portion of the baths of Dioclesian, converted into a convent. The principal hall forms the church, retaining its ancient walls, pillars, and vaults; there remains also a large square, supported by 100 pillars, with a beautiful fountain in the middle. Of the triumphal arches the only one remaining entire is the remarkable one of Constantine, with its pillars, statues, and has reliefs. The arch of Septimus Severus, also of marble, has its bas reliefs much damaged: and that of Titus has also suffered severely. Trajan's pillar is still covered with admirable bas reliefs, representing his Dacian expedition. These reliefs contain 2500 figures of men, besides a number of elephants, horses, and trophies. That in honor of the emperor Marcus Aurelius is of equal height, but of inferior execution.

Of the ancient aqueducts there remain the Fontana Felice, on the Viminal Mountain, supplied by the Aqua Claudia, and discharging itself through a rock under an Ionic arcade: at a considerable distance, and on the other side of the Tiber, rises an arcade, supported by pillars of granite, through which three streams descend from the summit of an adjacent hill. 2. The Fontana di Trevi, an elegant building of Corinthian architecture, ornamented with statues, and is perhaps the most finished structure of the kind in Europe. It would be tedious to enumerate the other fountains in Rome. The sewers of the ancient city are now much obstructed by stones and earth; but the Cloaca Maxima still merits attention. As to public baths, those great objects of Roman luxury, there remain of those of Caracalla little but the walls, and the baths of Titus, in tolerable preservation.

The Palatine Mount is now a shapeless mass of rubbish. Of the various theatres and circuses of ancient Rome hardly a vestige remains: even the Circus Maximus can be traced only by the hollow scooped of the Aventine valley; and many other monuments are of course obscured or demolished; so that a stranger is generally disappointed on his first investigation of this capital. It has of late been proposed to make a temporary diversion of the Tiber for the purpose of antiquarian research; but some attempts, in 1819 and 1820, to discover hidden relics, by means of a small vessel, with an apparatus for raising heavy bodies, have not succeeded.

Of the ancient roads, several, as the Via Latina, the Via Vitellia, the Via Aurelia, still serve to approach the Capitol; and the catacombs, originally

excavations made in digging out the earth used as bricks for building, are of great extent, penetrating, it is said, to a length of several miles.

The oldest church of modern Rome is that of St. Clement. The church of St. Pietro di Vincoli is a noble hall, supported by twenty pillars of Parian marble, and adorned with elegant tombs. St. Martin's and St. Silvester's are built of part of the materials of the baths of Titus. The church of St. Andrea, on Monte Cavallo, though small, is highly finished. That of St. Cecilia, in Trastevere, as well as those of St. Maria in the same quarter, St. Sebastiano and St. Pietro in Montorio, are all of great antiquity. The last contains Raphael's famous picture of the Transfiguration. The churches of St. Grisogono and St. Giovanni e Paolo are splendidly adorned with pillars. Santa Maria Egiznea, a building of the Ionic order, is supposed to be the ancient temple of Fortuna Virilis, and Santa Maria Sopra Minerva a temple of that goddess: while the church of Ava Cœli is said to occupy the site of the temple of Jupiter Capitolinus.

The Pantheon and seven patriarchal basilicæ, or cathedrals, are all of considerable antiquity. The pantheon, built in the reign of Augustus, and called from its form the rotunda, contains busts of a number of eminent men. Of the cathedrals, Santa Maria Maggiore is situated on the Esquiline Mount, and has two fronts, each of modern architecture. St. Giovanni, in Laterane, is the regular cathedral of the diocese of Rome. It was founded by Constantine. Another cathedral, that of Santa Croce, in Gierusalemme, was erected by Constantine on the ruins of a temple of Venus, and is remarkable for its antique form, and beautiful retired situation. A third church, begun by Constantine but much extended since his reign, is that of St. Paoli, outside of the city wall. The cathedral of St. Lorenzo is also outside of the city, on the Via Tiburtina.

The original St. Peter's was also erected by Constantine, but had been giving way for some time previous to the middle of the fifteenth century, when Nicholas V. conceived the project of taking it down. The work, however, was feebly prosecuted, till the reign of Julius II.. That prelate proceeded with it on a grand scale, and succeeding popes contributed to its completion. The most celebrated architects of modern times, Bramante, Raphael, Michael Angelo, Vignola, Maderno, and Bernini, have here displayed their talents. A circular court, formed by a vast colonnade, first strikes the eye of the spectator, and leads to the majestic front of the building, extending 400 feet in length, and rising to the height of 180. The eye is at the same time gratified with the majestic dome, rising from the central part of the church to a height from the ground of 324 feet. The interior of the church corresponds with its outward grandeur. Five portals open into the portico, a gallery extending across the width of the edifice, and resembling in size a cathedral. This magnificent entrance is paved with marble, covered with a gilded vault, and closed at either end by statues. Opposite to the five portals are five doors, leading into the church. On entering any of these the spectator

beholds the most spacious hall ever constructed by human art, expanding in magnificent perspective, its length being above 600 English feet. The aisles and altars are adorned with a number of ancient pillars; the walls with festoons, wreaths, tiaras, and other ornaments of marble. The patriarchal chair of St. Peter is a throne, elevated to the height of seventy feet. The high altar has below it what is called St. Peter's Tomb; above a magnificent canopy of brass, towering to the height of 132 feet. A well lighted staircase leads to the roof of St. Peter's, from which the dome can be viewed with minuteness. The access to every part of it, and even the ascent to the cupola, is perfectly easy. The recent part of the pile is the vestry or sacristi, a structure connected with the main building by a gallery, and adorned with a number of pillars, statues, paintings, and mosaics. It forms of itself a spacious church.

'The first visit paid to the church of St. Peter's,' says the spirited author of 'Italy,' 'should not be made by the ordinary conveyance to all such sights in Rome—a carriage. It should be approached by pilgrim-steps, slow and difficult; and that great temple,

— Where majesty,
Power, glory, strength, and beauty, all are hailed,

should be reached on foot, and sought through those various details of misery, disorder, and degradation, which distinguish alike all its avenues, and are the elements out of which its grandeur sprang. Around the other great Basilica of Rome there reigns a saddening region of desolation; and St. Paul's and St. John de Latran rise on the dreary frontiers of the infected desert they denominate, like temples dedicated to the genius of the mal-aria. But the approach to St. Peter's has another character: every narrow avenue is thickly colonised with a race of beings marked by traits of indigence or demoralisation; and every dark dilapidated den teems with a tenantry, which might well belong to other purlieus than those of the church. It is thus that the altars of St. Peter's are approached, as they were raised, upon the necks of the people. Here the streets of the filthiest city in Europe are found filthiest! Here forms, on which Love had set his seal, are equally disfigured by the neglect of cleanliness, or by meretricious ornament!—and the young plebeian beauty, lying on the threshold of some ruinous fabric, withdrawing the bodkin from tresses it is dangerous to loosen, and submitting a fine head to the inspection of some ancient crone, smiles on the passing stranger with all the complacency of a Du Barry, when she made her toilette for the good of the public, surrounded by the dignitaries of the church, who emulously canvassed for its offices. The streets leading immediately to St. Peter's occasionally exhibit a spacious but dilapidated palace, mingled with inferior buildings; but many even of these have their façades of marble disfigured by washerwomen's lines; and an atmosphere of soapsuds indicates an attention to cleanliness, whose effects are nowhere visible in Rome, but in the stench which issues from the laundresses' windows in the very finest

of its streets. These discouraging avenues at last waded through, the Piazza de St. Pietro in Vaticano bursts upon the eye, more striking from the contrast that its beauty and magnificence present to the images of poverty and disgust which have preceded it.

'Nothing that art or judgment can dictate, or criticism or pretension utter, on this great object of universal wonder, has been left unsaid or unillustrated. The profoundest Virtuosi of the last age have commented on it; the greatest poet of the present age has sung it; and from the folios of Piranesi to the portefeuille of the most juvenile traveller, views of its architecture are to be found. Little is now left to future visitants, but to enjoy, in silence, their own opinion (should they have any they may call their own), or at most to express the impression communicated to their own minds, on their first view of this supposed miracle of art. The first impression of the façade of St. Peter on the writer of these pages was one of utter disappointment. It did not strike her by its magnitude!—and in its want of simplicity and completeness (broken up as it is by pilasters, loggie, niches, balustrades, &c.), it did not affect her with pleasurable emotion. With none present to direct her judgment, and shame her ignorance, she turned involuntarily away, after a few minutes' observation, to contemplate objects infinitely more attractive to her unlearned apprehension. These were its beautiful semicircular colonnades; its noble fountains dashing their pure bright waters into mid-air, sparkling with sun-beams, and diffusing freshness as they fall; and that antique obelisk, whose transfer from Heliopolis (where the son of Sesostris raised it) to the circus of Nero, where Caligula placed it, includes the history of fallen empires, and of power not subdued, but strangely transmuted. The impression made by the façade of St. Peter's was never effaced. The original design of Michael Angelo, shown in the library of the Vatican, served but to confirm it; and the opinion of one, whose judgment, next to that of Michael Angelo's own, might be trusted, left the decision of ignorance sanctioned by the dictum of the presiding genius of the art.

'But the magnitude of St. Peter's is never justly estimated on a first or many following inspections; which is the fault of its faultlessness: for besides that it is out of the span of human recognition—beyond the test of all received experience—the harmony of its proportions is so perfect as to leave nothing for comparison; there flutter colossal doves in cornices lofty as the eagle's eyrie; there frown saints

—In bulk as huge

As whom the fables name of monstrous size, the Briareus's of the martyrology!—while cherubs, tall as Typhons, and letters to be read by the cubit, diminish the height of that cupola (the Ossa piled on Pelion of architecture), and lessen the vastness of those interminable naves, whose votive chapels might serve for metropolitan churches. But the temple of St. Peter, with all its unrivalled riches, surpassing the works of Memphian kings, is but a gigantic toy; and the

wanton, the incalculable profusion of its gems and precious stones, its statues and pictures, its mosaics and gold, its bronzes and marbles, its spotless freshness and unsullied lustre, separate it from the imagination, and leave it without one of those solemn associations which blend such edifices with a remembrance of the mysterious past, and give them an interest in the mind beyond what the eye can command.'

'Among the number of its splendid mausoleums,' continues this writer, 'all raised to the memory of pontiffs and princes of the church, or to enshrine the ashes of kings and queens, there is one which affords a striking commentary on the text of this mighty edifice. It is the tomb of the famous countess Matilda, the most powerful ally the church ever knew; and her defence of the popes and their system, and the bequest of her valuable patrimony to the church, have obtained for her a monument in St. Peter's, to which her ashes were conveyed from Mantua by pope Urban VIII. Her effigy represents a stern and dogged-looking woman, one whose strong volition might have passed for genius—she holds the papal sceptre and tiara in one hand, and in the other the keys of the church! at her feet lies her sarcophagus! and its relieves form the precious part of the monument. They represent the emperor Henry IV. at the feet of pope Gregory VII., where Matilda had assisted to place him. The abject, prostrate, half-naked emperor, surrounded by Italian princes and ecclesiastical barons, the witnesses of his shame and degradation, forms a fine contrast to the haughty and all-powerful pope; who seems ready to place his foot upon the imperial neck of the unfortunate sovereign, who, thus crouching in the dust, represented the Roman Cæsars! Such was the church in her great day!—When the emperor Joseph II. visited St. Peter's, and his conductors led him to this monument, he is said to have turned from it with an ironical smile, and a crimson blush of indignation! It was then, perhaps, that his personal feelings gave new impulse to his philosophical reformation, urging him to decide on the fate of cowls, hoods, and habits, with their wearers; and from that moment he may have considered

—Relic beads,
Indulgences, dispenses, pardons, bulls,
The sport of winds.' Milton.

One of the most remarkable modern additions to St. Peter's is the beautiful mausoleum, the work of Canova, raised to the memory of James II., king of England, his queen, and his two sons. This monument, and these titles, were bestowed by the munificence of the prince regent of England.

We shall follow the writer just quoted through the Vatican and the other principal palaces.

The *Palazzo Pontificio del Vaticano*, communicating with St. Peter's, is rather a congregation of palaces, than a single edifice; and its architecture is as various as the ages and talents that went to its completion. The genius of Bramante, of Raphael, of San Gallo, of Fontana, of Bernini, with many other eminent and scarcely inferior artists, has been concentrated on its progressive

erection; and the talents of all ages, of all nations, have contributed to fill its marble labyrinths. The elevation is divided into three lofty stories, each story surrounded by a loggia, or open corridor, richly painted; its countless halls, its endless galleries, its beautiful chapels, its venerable library, its twenty courts (*cortili*), and 200 stair-cases, present a wilderness of building, out of which the stranger, how frequent soever his visits, can only recal those particular apartments more eminently distinguished than others by some miracle or miracles of art, from which they take their name. The *Carte du Pays* he will never master; but, go where he may, he will never forget the loggia of Raphael, the Borgia suite, the Portico del Cortile, the Belvedere, and the successive cabinets dedicated to various works of antiquity,—the perfection of all that genius ever conceived, or art and labor perfected. Such are the halls of the animals, of the busts, of the muses, of the rotunda, the cabinets of the biga, of the candelabras, and that vast covered space which takes the various names of corridors of inscriptions (*dei Lapidi*), of the belvedere, of the *museo chiaramonti*, and *clementino*. This gallery is divided by gates and columns, as if to make artificial stages in its interminable length, and afford stations for the imagination to repose on, or memory to refer to. The first portion (into which the library of the vatican opens) is lined on either side with the rarest collection of inscriptions known in Europe. Those of the early Greek and Latin Christians, which have been found in the catacombs, occupy the left side; those of the heathen world are on the right, mingled with tombs, monuments, and sarcophagi, each in itself a study and a moral. The *museo chiaramonti* succeeds, rich in monuments of antiquity, statues, busts, and basso-relieues—the work of the Phidias's of other ages, arranged by the Phidias of the present. Here the living make their personal acquaintance with the dead, and the features of a Commodus, a Tiberius, and a Lucius Verus, become as familiar to the mind as their deeds and reigns. The *Museo Pio-Clementino*, the collection of the treasures accumulated by the late pope, changes the scene, and belongs to the edifices occupied by the deities and priestesses and emperors of the preceding gallery. Here are hung the appropriate ornaments of temples, theatres, basilicas, forums, circuses, baths, and palaces, all beautiful in design and perfect in execution; and to these naturally follows the vestibule of the tombs—with the sarcophagus of a Scipio and the sepulchral effigies of some fair Roman dame, over whose death-couch love still hovers. In moving among these consecrated images of art and time, the mind of the spectator catches something of their calm and dignity; for there is in ancient sculpture a quietude of grandeur, a solemnity of grace, not found in the works of modern genius, and which belong, perhaps, to the originals they copied. This majesty of expression and tranquillity of form, so well known to the Egyptians, lost something of its monumental sobriety under the Greeks. It is frequently found among savages, but rarely appears amidst the artificial exaggeration of corrupt civilisation. The French, who,

up to the Revolution, were a nation of dancing-masters, were the least graceful people of Europe; and the Apollo of Belvidere could never have been imagined in the court of a Louis XV.

This gallery so rich and beautiful, through the munificence of the late and present pope, was but 'of bare walls' when Evelyn visited it in 1643; and he observes that, as he passed through it on his way to the vatican library, it was full of poor people, to the number of 1500 or 2000, 'to each of whom, in his passage to St. Peter's, the pope gave a mezzo-grosso' (half a farthing). This is a curious episode in the history of the palace of the Vatican—of that palace whose uses and magnificence furnished Milton with his splendid imagery alike of hell and heaven—his palace of Pandemonium, and that

'Where sceptred angels held their residence.'

The library of the vatican, described as it merits, would fill the pages of an ample volume. The locale is a palace in itself; and its galleries and various chambers might be visited as a splendid museum, had they no other attraction. One of the most striking circumstances in the greatest library of Europe is, that not a book is to be seen, although of MSS. alone there are said to be 30,000 volumes. The cases in which the collection is preserved give no indication of their contents; and the whole edifice, all campo d'ore and ultra-marine, looks rather like some Gothic hall of grotesque festivity than the retreat of learning. The principal gallery, 317 palmi in length, is divided into naves, separated by pillars; and the walls are painted with representations of the most celebrated ancient libraries, of general councils, and of the inventors of the characters of various languages. Low cabinets, richly and fantastically painted, surround this superb saloon, and contain the most precious of the MSS.; and tables of Egyptian granite, marble sarcophagi, and other fragments of antiquity, are scattered over its centre. Two vast corridors to the right and left, divided into various apartments, open out of this main gallery. Here are modern book cases filled with choice works; and objects of art, of great value and antiquity, are profusely scattered. In one of these is a picture of the design of the Façade of St. Peter's by Michael Angelo, far superior to that which has been adopted. From the hall of the papyrus, painted by Mengs, opens another spacious gallery, ornamented with gold and mirrors, and containing the most precious books in the collection; and cabinets devoted to medals, engravings, inscriptions, succeed, and terminate this wing. On the other side a suite of beautiful rooms, with columns of porphyry, are filled with book cases, decorated with Etruscan vases; and the wall is decorated with a series of paintings illustrating the trials of the late and present popes, during the Revolution:—the crowning and restoration of Pius VII., closes these fasti of papal sensibility and endurance.

The *Quirinal* is a stupendous fabric, only less vast than the Vatican, and crowns the Quirinal hill, which commands a noble view of the city. Pope Pius VI. did much to adorn both the palace and the Piazza del Monte Cavallo on

which it stands. He removed the obelisk which stood near the mausoleum of Augustus, to the front of the palace; and, not being able to displace the Coliseum, he carried off all that was moveable from the forum, and transported that gigantic vase of oriental granite to the Monte Cavallo, which now receives the waters of its beautiful fountain. The state apartments of the Quirinal are sufficiently noble; they were inhabited by the emperor of Austria and his family on his visit to Rome; and in their gaudy dress when we saw them, bore testimony to the still unpaid for honors offered to the imperial guests. The gardens of the Quirinal are spacious and delightful, but encumbered with stones and marbles, as usual, disputing the soil with nature and vegetation. But all that is bright and fair in the Quirinal is brightest and fairest in that chapel in which the pope himself pontificates on Sundays and other holidays. When lighted by the mid-day beams, it looks like the temple of the sun, which once occupied its site. 'Here,' says lady Morgan, 'pictured saints appear as demi-gods; and the high altar exhibits a cross, brilliant and beautiful as that which lies on a lady's bosom. Here sounds that enchant, and odors that intoxicate, fill the air; and mysteries are consummated with forms so beautiful, and amidst objects so alluring, that the rigid or the ignorant might doubt whether he witnesses Christian ceremonies or heathen rites, and whether this is the temple of Apollo or the chapel of the pope.' The chapel of the Quirinal is on Sundays filled to suffocation. The tribunes on either side are occupied by the elegantes of London and Paris, Petersburg and Vienna, Cracow or New York. In the central nave the throng is composed of abbots, priors, and dignitaries in grand costume—the manelukes of the church! Roman generals, all armed for the military service of the altar, the only service they have ever seen; monks, guards, friars, Swiss soldiers, and officers of state! Outside a cordon, drawn round the choir, are placed the foreign gentlemen. The choir, the scene of action, all brilliant and beautiful, is still a void. When the signal is given, the crowd divides! and the procession begins! Mutes and others form the avant-garde of the pageant, and lead the way.

'Then comes personified infallibility! feeble as womanhood! helpless as infancy! withered by time and bent by infirmity; but borne aloft, like some idol of Pagan worship, on the necks of men, above all human contact. The conclave follows, each of its princes robed like an eastern sultan! Habits of silk and brocade, glittering with gold and silver, succeeded by robes of velvet, and vestments of point lace, the envy of reigning empresses.*

* We must find room for the note of our spirited guide. 'The details of the cardinal's toilette, which, at my own very womanish desire, were exhibited to me, are minute, splendid, and numerous, beyond description; for every ceremony has its dress. On some days the cardinals dress and undress as often as the three Mr. Singletons in the farce. The etole, or scarf, is now a sash superbly tissue'd: it is a symbol of the lost innocence of man—not of the cardi

The toilette of these church exquisites is perfect; not a hair displaced, not a point neglected, from the powdered toupee to the diamond shoe-buckle. The pope is at last deposited on his golden throne: his ecclesiastical attendants fold round him his ample caftan, white and brilliant as the nuptial dress of bridal queens! they arrange his dazzling mitre: they blow his nose; they wipe his mouth, and exhibit the representation of Divinity in all the disgusting helplessness of driveling caducity. His holiness being thus cradled on a throne to which emperors once knelt, the conservators of Rome, the carryatides of the church, place themselves meekly at its steps; and the manikin, who represents the Roman senate, takes his humble station near that imperial seat, more gorgeous than any the Cæsars ever mounted. Meantime the demigods of the conclave repose their eminences in their stalls on velvet cushions, and their caudatorj (or tail-bearers) place themselves at their feet. In the centre stand, or sit, on the steps of the high altar, the bishops with their superb mitres and tissue vestments. Then the choir raises the high hosannahs, the pope pontificates; and the temple of Jupiter never witnessed rites so imposing or so splendid. Golden censers fling their odors on the air! harmony the most perfect, and movements the most gracious, delight the ear and eye! At the elevation of the host, a silence more impressive than even this 'solemn concord of sweet sounds' succeeds; all fall prostrate to the earth; and the military, falling lower than all, lay their arms of destruction at the feet of that mystery, operated in memory of the salvation of mankind. When the ceremony is concluded, the procession returns as it entered. The congregation rush after; and the next moment the ante-room of this religious temple resembles the saloon of the opera. The abbots and priors mingle among the lay

nal's. The piviale is a mantle, like the ancient Irish cloak: it is of massive gold tissue, insupportably heavy. This represents the pastoral robe of the patriarchs (for all in the church, Catholic or Protestant, is borrowed from the Jews—Christ having left nothing to copy but virtue and self-denial). This piviale was originally pluviale, and worn (as its name imports) to keep out the weather, before gold brocades were invented. The Soutane is a truly eastern habit: it is of violet velvet or silk, and its long and flowing train is held up by the caudatori. This was surely not 'the cloak' which St. Paul left behind him 'at Troas.' Next comes the golden pinelli, and the manipolo, of embroidered satin, which hangs on the arm, like a fine lady's reticule, and is the scrip of the patriarchal herdsman, in which he carried his bread and cheese. Then comes the camicia, a dress of the richest point lace. I saw three of these dresses belonging to one cardinal, said to be worth £2000; and I know it for a fact, that more than one petty reigning sovereign has endeavoured to wheedle his eminence out of a camicia worn upon state days. The mitres are of gold and silver, upon white or red grounds, according to the cardinal's various ranks. In private society their dress is a suit of black, edged with scarlet; scarlet stockings, and a little patch of red, called the calotte, on the crown of their heads, with their cardinal hat under the arm.

crowd, and the cardinals chat with pretty women, sport their red stockings, and ask their opinions of the pope's pontification, as a *marveilleux* of the opera at Paris takes snuff, and demands of his *chère-belle*, 'Comment trouvez vous ça, comtesse?'

The palace of the Lateran, though now uninhabited, is vast and imposing; and, though little of the original building remains, it is sufficiently antiquated to recal its ancient destination as the scene of much of the licentious dissipation and fierce feuds of popes and anti-popes in the dark ages. It commands a sublime view of the waste its lords have made;—of the Campagna, stretching to the base of the blue Albanian hills; its desert, here and there spotted with ancient ruins of the tombs of heroes, or imperial aqueducts, with the walls of villas, and wrecks of monuments which skirted the road from the gates of the Lateran to the suburbs of Naples. The church, or basilica, of San Giovanni Laterano, is the principal, and one of the oldest, as we have seen, in Rome.

In the baptistery (*Battisterio Lateranense*) adjoining the church, built by Constantine, he is said to have been baptised by St. Sylvester. It was ravaged by frequent invaders, and long remained in the lower ages in a state of absolute ruin and spoliation; until, attracting the notice of successive pontiffs, and particularly that of Gregory XIII. and Urban VIII., it took that character of richness which now distinguishes it. The baptismal font is an ancient urn of basalt, ornamented with gold and bronze. From its bosom the waters of life are still dispensed to the Jews, who annually seek regeneration at so much per head. This edifice (its great antiquity, its superb columns of porphyry, and fine cornices, all plunder from the ancient monuments of Rome, excepted) has but little to excite admiration. Two of its pictures, however, afford a curious historical evidence, worth noticing. One represents the council of Nice burning books written against the bishops. The other the breaking of the statues in the Roman temples (probably the rivals of the Apollo and the Antinous): a bishop, with the air of a conjurer, stands by, tossing his golden censer, and purifying the spot defiled by the works of Praxiteles and Phidias. This was before a bull was fulminated to prevent (but too late) the converting of marble statues into lime, to build dwelling houses.

Opposite to the great entrance of the palace stands the venerable chapel of the Scala Santa (holy steps), once a part of the ancient building. This chapel is the shrine of daily pilgrimage to the peasantry, many of whom were ascending its holy steps on their knees, on the several days that we passed by it. The veneration paid to this flight of stairs arises from the five centre steps, said to be part of the staircase of Pontius Pilate's house, which were sanctified by the blood of Christ. None can ascend it but on their knees; and lateral steps are provided for those whose piety may not lead them to genuflexion.

There are family mansions, here termed *palaces*, in great numbers; but the far greater part

are less remarkable for their architecture, than for their size and decorations: their spacious courts and porticos, their halls and lofty apartments, with the pillars, the marble, the statues, and the paintings, that place them on a level with royal residences in the north of Europe. The Palazzo Doria is one of the finest, presenting three large fronts, enclosing a spacious court. Its stair-case, supported by light pillars of oriental granite, leads to a magnificent picture gallery. The Palazzo Ruspoli has a still finer staircase, consisting of four flights, of thirty steps each, each step being composed of a single piece of marble, nearly ten feet long and two broad. The Corsini palace is also remarkable for its size, its furniture, and its gardens. The Palazzo Farnese occupies one side of a handsome square. Twelve massive pillars of Egyptian granite support the vestibule; three ranges of arcades rise one above the other around a spacious court; and noble apartments follow. The Palazzo Costaguti and Palazzo Mattei are chiefly rich in paintings. The Borghese palace is remarkable for its porticoes, its columns, and its antiques. In the Palazzo Spada stands the celebrated statue of Pompey, at the foot of which Cæsar is supposed to have fallen. The Barberini palace has been much improved by the present prince, but serves chiefly to remind the reflecting Protestant of the wretched policy by which the illegitimate children and nephews of the popes have been formerly enriched. Here once reigned the famous beauty and humorist, Cecca Buffona, the mistress of cardinal Francisco Barberini, whose impudicity caused her to be publicly whipped in the streets of Rome.

Rome, like most other Catholic cities, is well supplied with inferior and antiquated hospitals. The largest, the *Spedale di St. Spirito*, is open indiscriminately to the poor of both sexes, the insane, and to foundlings. That of *St. Michele* is appropriated to the education of the children of the poor, but it receives likewise the sick and the aged. Here is also a house of correction.

The most splendid villas of Rome, as that of the Borghese, Farnesina, &c., are situated within the walls. The first was built by cardinal Scipio Borghese, the nephew of Paul V.; and, with its gardens and lake, occupies a space of nearly three miles in circumference. The interior is filled with antique and modern sculpture, pictures, and mosaics—without, its grounds are covered with casinos, temples, citadels, aviaries, and all that a gorgeous and false taste, with wealth beyond calculation, could crowd together: Mont-fauçon says ‘there is nothing better worth seeing in Rome.’

The villa Pamfili-Doria, one of the finest in the neighbourhood of Rome, was erected in the seventeenth century, by the nephew of the Pamfili pope Innocent X., whose extravagant passion for his sister-in-law, Donna Olimpia Maldachini, is one of the most notable traits in his life. The grounds, woods, and gardens are truly delicious: the palace itself has all the generic features of such edifices, and is filled with pictures and statues, dreary and neglected.

The Villa Albani, raised in the middle of the last century by the late cardinal, and belonging

to the present cardinal Albani, is, according to lady Morgan, the most perfect and freshest of all Roman villas. ‘It looks like some pure and elegant Grecian temple—a little Pantheon! dedicated to all the rural gods, with whose statues (the most perfect specimens of antiquities) its marble colonnades and galleries are filled. It might be deemed too ideal for a human habitation; yet is sufficiently commodious to be one; and, of all other villas, this alone realizes the preconceived image of fervid fancies of a true Italian villa. Its walls are encrusted with basso-relieues—its corridors grouped with fauns and nymphs—its ceilings all azure and gold—its saloons perfumed by breezes, loaded with the odors of orange-flowers. Its gardens, studded with temples, command a view, terminated by a waving line of acclivities, whose very names are poetry. When I visited it, a distant blue mist veiled the intervening wastes of the Campagna, and the dews and lights of morning lent their freshness and lustre to a scene and fabric such as Love might have chosen for his Psyche when he bore her from the wrath of Venus. But, when the first glimpse of this vision faded, the true character of the Roman villa came forth; for artichokes and cabbages were flourishing amidst fauns and satyrs, that seemed chiselled by a Praxiteles! The eminentissimo padrone of this splendid villa rarely visits its wonders but in the course of a morning drive: and his gardens are hired out to a Roman marketman, to raise vegetables during the spring and winter. In summer even the custode vacates his hovel, and the Villa Albani is left in the undisputed possession of that terrible scourge of Roman policy and Roman crimes—the *Mal-aria*; the causes and effects all morally connected, and the strictest poetical justice every where visible.’

Rome contains, beside its celebrated Propaganda Fide, several literary associations, as the Arcadian academy, the archæological, the *accademia Tiberiana*, the academy of the fine arts. A monthly publication, partaking of the nature of a review and magazine, appears under the title of *Giornale Arcadico de Scienze, lettere, ed arti*; and, since 1819, there has been published weekly a *Giornale encyclopedico*, containing chiefly translations on scientific subjects, along with some pieces of poetry. Of the libraries of Rome, the largest, after the Vatican, are the Augustines’, the Dominicans’, and those of the Barberini, Chigi, Colonna, and Corsini families; that of *Collegio Romano* has a museum of antiquities and cabinet of natural history. The university library is called, from its founder, pope Alexander VII., the Alexandrine library; and the library del Emo contains a collection of medals and mathematical instruments, together with a museum.

In 1817 the inhabitants of Rome amounted to 130,000, a number which seems to have formed, with little variation, its population for about a century. Of these, no fewer than 9000 are said to be Jews, who are restricted to a particular quarter, the gates of which are closed every night. This place is very dirty, but a similar charge may be made against all modern Rome. The number of inhabitants connected

with the church, as priests, monks, or nuns, is computed at another 8000. The manufacturing establishments, though small, are in considerable variety, viz. woollens, silks, velvets, hats, gloves, stockings, liquors, pommade, and artificial flowers. Rome has a bank, and Monte di Pietà, or house for advancing money on deposited goods. Its foreign trade is limited to imports of colonial articles, and a few manufactured goods: its exports consist of the produce of the adjacent country, viz. olive oil, alum, vitriol, puzzuolano sand, anise, &c.

No part of the world has been more agitated by the French revolution and its consequences—none perhaps so much improved—as modern Rome. Its nobles were, at the latter end of the sixteenth century, a race of banditti: laying waste their native city, and carrying desolation and ruin into the bosom of domestic life. The people, always insurgents or slaves, were the most demoralised of Italy; and though the dark and cruel despotism of the clever Sixtus V., whose love of blood induced him to envy Elizabeth the cutting off of Mary's head, stemmed for a time the torrent of iniquities, and broke for ever the spirit of the Roman barons, yet at his death the people were but the more debased by the loss of their ferocity. During succeeding periods, on the testimony of all travellers, the civil and religious state of Rome was an anomaly in human society. The court of the Quirinal, like that of France under Louis XIII. and XIV., was directed by the intrigues of priests and courtiers: the cardinals governed by cabal, and all places were disposed of through their mistresses and their laquais. The princes or patricians, rich, idle, ignorant, and avaricious, were surrounded by dependents and parasites, the indigent followers of rank and opulence: the people, without domestic habits, lived like the commoners of nature, satisfied if bread and church ceremonies sustained life and amused it. The parasite came after the prince, and the beggar after the saint. The women of all ranks, divided into vestals and concubines, were either shut up in a convent, or let loose upon society, the mistresses of authorised paramours, and the wives of other women's lovers. The passions of all classes were unsubdued by education, unrestrained by law. Murder had its price, from a basket of figs to a purse of gold; and the murderer his asylum, from the high altar of the church to the cabinet of the palace. Assassination was a deed of nightly occurrence. In the midst of all this corruption of private manners, the inquisition placed its sbirri upon the intellect of the whole population. The capital punishments were barbarous, but rarely inflicted; and if the people sometimes suffered the torture, or submitted to the estrapado, they, in their turn, occasionally hung up a cardinal, or derided the vices of the conclave and the pontiff, through the medium of Pasquino. In 1786 cardinal Tortonà so exasperated the people by his cruelties, in his office of grand inquisitor, that they dragged him from his carriage, and hung him on a gibbet in the street.

As there was no internal police, the public depended on the works of the Tarquins and the

Cæsars for their few accommodations: and the conduits for water, miraculously constructed during the darkest ignorance on the subject of hydraulics, were at the end of twenty centuries, and are still, the principal means of purification afforded for cleansing a city, which seems to have benefited but little by the advantages lent it by antiquity. The Cloacæ Maxima obtrude their neglected openings in vain; and streets lined with palaces, and palaces walled with marbles, have even now few sewers to carry off their accumulated filth.

Before Italy was conquered, Rome entered into the revolutionary projects of France. Hugo de Basseville, a man of letters and talent, was chosen by the national convention to sound the disposition of those who were no longer the population worked on by the eloquence of the monk Arnoldo, or the tribune Rienzi. Pius VI., who had refused to acknowledge the French republic, watched with jealous vigilance the motions of this emissary; and de Basseville affected to be occupied with the interests of the French academy at Rome. At length an imprudence on the part of de Basseville called forth the public opinion. After a dinner, given by him to the young men of the French academy, de Basseville drove with his wife and son to the Corso, permitting his footmen to mount the tricolor cockade. This was the signal of tumult. The street was accidentally or designedly filled with the common people and Trasteverini! A dreadful riot arose: de Basseville in vain sought to save himself by taking shelter at his banker's; he was pursued by the mob, and murdered. The first stab was given by a soldier of the pontifical guard. The French academy was next attacked and pillaged; the houses of foreigners were plundered; and, during the tumult, the virgin, whose name was the mot d'ordre, was seen in several of the churches to open her eyes (lest the people should open theirs), and to give testimony of the part she took in this crusade to her honor. But if, in 1793, an emissary of the convention was assassinated in Rome, in 1797 the Gauls of the eighteenth century had passed the Rubicon, conquered Romagna, the duchy of Urbino, and the Marsh of Ancona. The murder of general Duphot at Rome, under the eyes of the accredited ambassador of France, urged on the fate of the 'Niobe of Nations.' The military occupation of Rome followed, and the proud capital of the world became a French province, by the name of the department of the Tiber!

Whatever reform, or feature of change, may be found in the circles of Roman society, belongs almost exclusively to the Cittadini of the best description, including persons of liberal profession, artists, some of the employés, and the mercanti di campagna, or gentlemen farmers or agriculturists, whose landed property has grown out of the sales of the church estates during the Revolution; and who, though chiefly resident at Rome, live by the produce of their farms. If something of cleanliness and order is visible in a Roman ménage, if stairs are found lighted at night, and rooms look not dirty by day, the innovation on ancient manners is only to be found in the dwellings of this respectable class.

It is in this class also that what little social intercourse is kept up at Rome is most frequent. It was this class that chiefly participated in the benefits of the recent changes; and they look back to the past with a regret in which personal interests and self-love may have no inconsiderable influence. While the Roman shopkeeper (who lolls and lounges in his bulk all day, and asks a price à capriccio for his French and British wares), seeks his recreation at the pulicorda or the comic opera; while the inferior dealer knows no enjoyment beyond stuffing, with twenty others, into a hired calesh, on Sunday noons, and driving through the hot and dirty streets, 'per fare il pizzacarolo,' the cittadini have more refined sources of recreation; they hold a musical academia in each other's houses, or assemble to assist at a 'tragedia alla tavola' (the reading round a table some favorite tragedy of Alfieri or Monti); or, if the higher order, they attend the conversazione of some mezza dama, or half lady; a class of provincial nobility, who come from the cities of La Marca, or the legations, to pass the winter at Rome, and who, if permitted by courtesy to visit a signora principessa, are never presumed to be of her circle, nor admitted to the house of such ambassadors as rightly understand the true Roman 'dignità!'

'Apart from the great mass of the population, separated by the distinctions of ages, foul and

fatuous as an Indian fakeer, and sunk in the dusky niche of its splendid sty, vegetates the Roman patrician, or prince of the empire! The morning is lounged away by the heir of the Gregories and the Clements in a dusty great coat (the modern Roman toga), rarely changed at any season of the day for a better garb. An early, but not a princely dinner, follows; succeeded by the siesia and the Corso, a funereal drive in a long narrow street, relieved in summer by a splashy course in the Piazza Navona. The prima sera is passed in some noble palace, where, at the end of a long suite of unlighted rooms, sits the signora principessa, twinkling her eyes before a solitary lamp, or pair of candles, whose glimmer is scarce visible in the gloomy space, which a fire never cheers; while the caldanini, whose embers have expired in the atmosphere of her petticoat, is presented to the most distinguished of her visitors; and such a conversation ensues as minds without activity or resource may be supposed to supply: a sermon of the popular preacher, Padre Pacifico, if it be Lent; a cecisbio faithless or betrayed, if at the carnival, fill up the time till the opera commences, or until the only two genuine Roman houses open to society in Rome light up their Rouge et noir tables, the sole object for which company is received or for which company go.'

ROMFORD, a market town of Essex, situated on the road from London to Colchester; seventeen miles south-west of Chelmsford, and twelve E.N.E. of London. This town is supposed by Stukeley to occupy the site of the Roman station Durolitum, and he conjectures that its present name is a contraction for Romanford, in which opinion he is supported by Mr. Lethieullier. Lysons, however, derives it from the Saxon words Rom and Ford (the Broad-Ford), in allusion to an ancient ford over a rivulet which flows past the western extremity of the town. Romford is first mentioned in the red book of the exchequer; where it is said that, in 1166, Roger Bigod, duke of Norfolk, held 'the wood of Romford by serjeancy, and payment of 5s. a-year.' It is next noticed in 1277, at which time the manor formed part of the possessions of Adam de Cretigny. It afterwards passed to Thomas de Brotherton, earl of Norfolk, from whom it descended by marriage to the Mowbrays, dukes of Norfolk; but on the death of John, the fourth duke, without male issue, in 1477, it became vested in James lord Berkeley. The town of Romford consists chiefly of one long street running along the high road. Near the middle of the town stands the market-house and town-hall which were repaired in 1768, at the expense of the crown. The church, which is a chapel of Hornchurch, is an ancient structure, probably erected about the commencement of the fifteenth century, when the inhabitants obtained a bull from the pope, authorising them to consecrate a cemetery adjoining the town, for the burial of their dead, who had previously been carried to Hornchurch burying-ground. It is dedicated to the Virgin Mary and Edward the

Confessor, and consists of a nave, chancel, and north aisle, with a tower at the west end. In the east window of the chancel is a whole length on glass of Edward the Confessor. Not far from the church is a charity-school for forty boys, and another for twenty girls, founded and endowed in 1728; and at a short distance from the western end of the town are barracks for the accommodation of a regiment of cavalry, erected in 1795. Romford is governed by a bailiff and wardens, who, though forming no corporation, are empowered by letters patent to hold a weekly court for the trial of all causes, whether civil or criminal, high treason itself not excepted. The privilege of holding a weekly market was first granted to the inhabitants by king Henry III. To the westward, about two miles, lies Hainault Forest, in which is a very remarkable tree, called Fairlop-oak, which Gilpin informs us, in his Remarks on Forest Scenery, is traced by tradition 'half way up the Christian era.' It is thirty-six feet in girth near the base or root, and spreads its branches over a circumference of 300 feet. Round the Fairlop-oak, on the first Friday in July, is held an annual fair. Markets on Monday for hogs, Tuesday for calves, sheep, and lambs, and Wednesday for corn, cattle, poultry, butchers' meat, &c.

ROMILLY (Sir Samuel), K. C., an eminent modern chancery advocate, was the son of a jeweller, of French extraction, who carried on business in Frith Street, Soho. Here he was born, March 1st, 1757, and, receiving a private education, was placed in the office of a solicitor, which he quitted to study for the bar, to which he was called in 1783. His chief practice was long confined to draughts in equity, but he gradually

rose to distinction in court, and agreeing in his general politics with the whigs, during the administration of Mr. Fox and lord Grenville, he was appointed solicitor-general. In parliament he was highly distinguished by his talent in debate, and particularly by the eloquence with which he pleaded for a revision of the criminal code, with a view to the limitation of capital punishment. On this subject he also composed a very able pamphlet. Sir Samuel also published a remonstrance against the creation of the office of vice-chancellor; and was in the height of his popularity, when a nervous disorder, produced by grief at the death of his lady, seems to have deprived him of reason, and in a fit of temporary frenzy he terminated his existence, November 2d, 1818.

ROMNEY, OLD, a market town of Kent, once a place of note, and a sea-port at the mouth of the Rother, but the river having changed its course to Rye, and the sea having receded, it has long since fallen to decay. Here is an old church in the massive circular style.

ROMNEY, NEW, a borough and market town of Kent, seven miles south-west from Hithe, and seventy-one and a half south-east from London. This place, though not so ancient as Old Romney, is recorded to have been a flourishing town at the time of the conquest, having had five parishes. The town consists chiefly of one broad, well-paved street, intersected by another smaller one. St. Nicholas' church is an ancient structure, consisting of three aisles and three chancels, with a square tower at the western extremity. The charitable institutions of the town are an hospital and a school-house. The market-house is a modern building, standing in the main street. The chief trade of this place is grazing cattle on Romney Marsh. This marsh is a rich tract of land of about 50,000 acres, defended from the encroachments of the sea, by an embankment three miles in length, twenty feet high, twenty feet broad at the top, and nearly 300 at the bottom. Towards the sea it is defended by piles and stakes, at an expense of about £4000 per annum, which is raised by an assessment on the proprietors of the marsh. This is called Dymchurch Wall, along which there is a good road for carriages. The corporation consists of a mayor, twelve jurats, chamberlain, recorder, town-clerk, &c., and is one of the cinque-ports, though its harbour has long been destroyed; the hall, where the courts of the Cinque-Ports are held, is near the church. It sends two members to parliament, the right of election being in the mayor, who is returning officer, jurats, and commonalty. Market-day, Thursday.

ROMNEY (George), a modern painter, was born in Lancashire, in 1734. After an attempt of his father to settle him in trade, he was placed with an artist, and in 1762 came to London. In 1765 he gained a prize from the Society for the Encouragement of Arts and Sciences, for a picture of the Death of King Edmund, and in 1773 went to Italy for two years. On his return he enjoyed the most uninterrupted success in his profession, painting in one year portraits to the amount of £3635. He also gave illustrations of Boydell's Shakspeare. Romney died in 1802.

VOL. XIX.

He is not always happy in blending his shades, particularly in his back-grounds, but his style of coloring is broad and simple, and in his flesh he was very successful.

ROMP, n. s. Fr. *ramper*. To gambol; a rude, boisterous, playful girl: to play rudely or boisterously.

She was in the due mean between one of your affected courtesying pieces of formality, and your *romps*, that have no regard to the common rules of civility. *Arbutnot.*

In the kitchen, as in your proper element, you can laugh, squall, and *romp* in full security. *Swift.*

Romp loving miss
Is hauled about in gallantry robust. *Thomson.*

Men presume on the liberties taken in *romping*.
Clarissa.

ROMSEY, or RUMSEY, a market town and parish of Hampshire, eight miles N. N. W. of Southampton, and seventy-four west by south of London. It is situated on the little river Test, which falls into Southampton Bay, and was formerly noted for its monastery of Benedictines, founded by king Edgar, and of which the daughter of king Stephen was an abbess. The church, formerly belonging to the monastery, is a noble edifice, built in the form of a cross, and arched with stone in the Saxon style; it contains several curious monuments. Besides the church, there is a meeting house for Presbyterians; an almshouse for six widows; a charity-school, and a free-school. There is also a town-hall, and an audit-house, below which are accommodations for the market people. The corporation consists of a mayor, recorder, six aldermen, and twelve capital burgesses. The principal trade of the town is in shalloons, sacking, and paper, and it has been noted for the excellence of its ale. The market, on Saturday, is a good corn market.

ROMULUS, the son of Rhea Silvia, the founder and first king of Rome. See **ROME**. On a medal of Antoninus Pius, he appears like Mars Gradivus, with a spear in one hand, and a trophy on the opposite shoulder. It is very probable that several of the supposed figures of Mars, with a trophy so placed, belong rather to Romulus, who was the inventor of trophies among the Romans.

The whole story of the birth of this hero is represented in a relieve at the villa Mellini in Rome. It is divided into four compartments. In the first Mars is going to Rhea as she sleeps by the Tiber. In the second she is sitting with her twins in her lap, whilst Amulius seems to be upbraiding her. In the third the two infants, Romulus and Remus, are exposed on the banks of the river; and the fourth represents them as cherished by the wolf, whilst Faustulus stands surprised at their strange situation. This work is but indifferent; however, the particulars of it are to be met with in other works of better ages. The descent of Mars to Rhea is not uncommon; and the circumstance of Romulus and Remus being suckled by the wolf is very common on medals, gems, and statues.

RONALDSEY, NORTH, the most northern island of Orkney, two miles long, and one broad; six miles north of Sandy. The surface is flat, the soil sand, and clay. The coasts af-

D

ford sea ware, from which many tons of kelp are made annually.

RONALDSEY, *SOUTH*, the most southern island of Orkney, about six miles long, and three broad; bounded by the German Ocean on the east, by the Pentland Frith on the south and west, and by the Ferry of Water Sound, which separates it from Burray, on the north. The climate is excellent; the surface is pretty level; the soil various, but fertile. It has several good harbours, which will admit ships of 600 tons, as Widewall Bay on the west, and St. Margaret's Hope on the north. It is much frequented by lobster smacks. This island has three headlands; viz. Barsick, Halero, and Stoic's Head.

RONCESVALLES, a valley in the province of Navarre, Spain, between Pampeluna and St. Jean Pied du Port, surrounded by mountains, one of which, the Ronceval, is among the highest of the Pyrenees. This valley is celebrated for the defeat of Charlemagne by Loup, duke of Gascony, assisted by the Saracens. A pillar erected on the spot, in commemoration of the victory, was destroyed by the French in 1794. The small town of this name is fourteen miles N. N. E. of Pampeluna.

RONDA, a large but uninteresting town of Granada, Spain, except in respect to its situation. This is most romantic, and its natural curiosities are not few. It stands on the summit of a rocky mountain, divided by a deep ravine or fissure, which winds around the town, the river rushing along its bottom. This ravine is full of abrupt cliffs and crags, lightly covered with earth: over the fissure there are two bridges, each of a single arch: one is at the height of 120 feet above the water, the other at that of 280 feet! This arch is 110 feet in span, and supported by pillars of masonry from the bottom of the river. Seen from this elevation, the Guadaro is dwindled to a brook. Hardly any scene can be more striking than the view from below this bridge, of part of the houses and spires of the town, which seem to overhang the spectator. The public walk is paved with marble, and bordered with vine branches in trellises, which in hot weather afford an agreeable shade. Leather, and silk stuffs are manufactured here, and the environs are well cultivated, and fertile in corn, wine, and oil. Inhabitants 20,000. The plain abounds in cattle, and the hills in game. The Sierra de Ronda, a chain of mountains which takes its name from this town, is of considerable height, and extends all the way to Gibraltar. About a league south-east of the town is the Cresta de Gallo, so called from the supposed resemblance to a cock's comb. It is frequently the first land discerned at sea, on approaching Cadiz, and contains mines of iron, tin, and lead.

RONDELETIA, in botany, a genus of the monogynia order, and pentandria class of plants; cor. funnel-shaped: caps. bilocular, inferior, and polyspermous, roundish, and crowned. Species eleven, natives of the West Indies.

RONDE, *RHONDE ISLAND*, or *REDONDA*, one of the Grenadines, or dependencies of the island of Grenada, in the West Indies; situate about mid-way between Cariacou or Carriacou, and the north end of Grenada, about six miles

north of Grenada, and eleven south-west of Carriacou. It contains about 500 acres of land applied to pasturage, and the cultivation of cotton. Long. 61° 39' W., lat. 12° 19' N.

RON'DLE, *n. s.* From round. A round mass.

Certain *rondles* given in arms, have their names according to their several colours. *Peachment.*

RON'ION, *n. s.* Fr. *rognon*, the loins. A fat bulky woman.

Give me, quoth I;
Aroint thee, witch, the rump fed *ronyon* cries.

Shakspeare.

RONSARD (Peter) de, a French poet, born in Vendomois, in 1524. He was descended of a noble family, and was educated in Paris in the college of Navarre. He then became page to the duke of Orleans, and afterwards to king James V. Ronsard continued in Scotland with king James upwards of two years, and afterwards went to France, where he was employed by the duke of Orleans in several negotiations. He accompanied Lazarus de Baif to the diet of Spire, and studied the Greek language with his son under Dorat. He cultivated poetry with such success that he acquired the appellation of the Prince of the Poets of his time. Henry II., Francis II., Charles IX., and Henry III. loaded him with favors. Having gained the first prize of the Jeux Floraux, the city of Thoulouse caused a Minerva of massy silver of considerable value to be made and sent to him. This present was accompanied with a decree declaring him The French Poet, by way of distinction. Ronsard afterwards made a present of his Minerva to Henry II. Mary queen of Scots gave him a very rich set of table plate. He wrote hymns, odes, a poem called the *Franciade*, eclogues, epigrams, sonnets, &c. Ronsard, though it is doubtful whether he ever was in orders, held several benefices in commendam; and he died at one of these, Saint-Cosme-les-Tours, in 1585, being then sixty-one years of age. Ronsard's poems appeared in Paris in 1567, in six vols. 1to., and in 1604, in ten vols. 12mo.

RONT, or *r* Goth. *rian* *maut*. An animal *Runt*, *n. s.* stunted in the growth.

My ragged *ronts* all shiver and shake,
As done high towers in an earthquake;
They wont in the wind, wag their wriggle tails,
Peack as a peacock, but nought it avails. *Spenser.*

ROOD, *n. s.* From rod. The fourth part of an acre in square measure.

Satan,
With head uplift above the wave, his other parts
Prone on the flood, extended long and large,
Lay floating many a *rood*. *Milton.*

For stone lencies in the North, they dig the stones
for eighteen-pence a *rood*, and make the walls for the
same price, reckoning twenty-one foot to the *rood* or
pole. *Mortimer.*

I've often wished that I had clear,
For life, six hundred pounds a-year,
A terras-walk, and half a *rood*
Of land, set out to plant a wood. *Sicily.*
No stately larch-tree there expands a shade
O'er half a *rood* of Larisscan glade. *Harle.*

ROOD, *n. s.* Sax. *rode*; Goth. *roda*. The cross; sometimes an image of a saint.

By the holy *rood*,
I do not like thee several councils. *Shakspeare*

ROOF, *n. s. & v. a.* } Sax. *hrof*; Goth. *raef*.
 Roof *r*, *adj.* } In the plural Sidney has
 rooves: now obsolete. The cover of a house;
 any covering: to cover with a roof.

Her shoulders be like two white doves,
 Perching within square royal rooves. *Sidney*.
 From the magnanimity of the Jews, in causes of
 most extreme hazard, those strange and unwonted
 resolutions have grown, which, for all circumstances,
 no people under the roof of heaven did ever match.

Hooker.

Return to her, and fifty men dismissed!
 No, rather I abjure all roofs, and chuse
 To wage against the enmity o' the' air. *Shakspeare*.
 Swearing till my very roof was dry
 With oaths of love. *Id. Merchant of Venice*.

Here had we now our country's honour roofed,
 Were the graced person of our Banquo present.

Shakspeare.

Some fishes have rows of teeth in the roofs of their
 mouths; as pike, salmons, and trouts.

Bacon's Natural History.

I'll tell all strictly true,
 If time, and foode, and wine enough accrue
 Within your roofe to us; that freely we
 May sit and banquet. *Chapman*.

Large foundations may be safely laid;
 Or houses roofed, if friendly planets aid. *Creech*.

He entered soon the shade
 High roof, and walks beneath, and alleys brown.

Milton.

In thy fane, the dusty spoils among,
 High on the burnished roof, thy banner shall be hung.

Dryden.

Snakes,

Whether to roofy houses they repair,
 Or sun themselves abroad in open air,
 In all abodes of pestilential kind
 To sheep. *Id. Georgicks*.

I have not seen the remains of any Roman build-
 ings that have not been roofed with vaults or arches.

Addison.

A Roof is the covering of a building, by which
 its inhabitants or contents are protected from the
 injuries of the weather. It is the essential part
 of a house, and is often used to express the
 whole. To come under a person's roof is to
 enjoy his protection and society, to dwell with
 him. Tectum was used in the same sense by
 the Romans. To be within our walls rather ex-
 presses the being in our possession: a roof
 therefore is not only an essential part of a
 house, but it even seems to be its characteristic
 feature.

The Greeks, who have perhaps excelled all
 nations in taste, and who have given the most
 perfect model of architectonic ordonnance with-
 in a certain limit, never erected a building which
 did not exhibit this part in the most distinct
 manner; and though they borrowed much of
 their model from the orientals, as is evident to
 any who compares their architecture with the
 ruins of Persepolis, and of the tombs in the
 mountains of Sciraz, they added that form of
 roof which their own climate taught them was
 necessary for sheltering them from the rains.
 The roofs in Persia and Arabia are flat, but those
 of Greece are without exception sloping. It
 seems therefore a gross violation of the true
 principles of taste in architecture (at least in
 the regions of Europe), to take away or to hide
 the roof of a house; and it must be ascribed

to that rage for novelty which is so powerful in
 the minds of the rich. Our ancestors seemed to
 be of a very different opinion, and turned their
 attention to the ornamenting of their roofs as
 much as any other part of a building. They
 showed them in the most conspicuous manner,
 running them up to a great height, broke them
 into a thousand fanciful shapes, and stuck them
 full of highly dressed windows. We laugh at
 this, and call it Gothic and clumsy; and our
 great architects, not to offend any more in this
 way, conceal the roof altogether by parapets,
 balustrades, and other contrivances. Our
 forefathers certainly did offend against the
 maxims of true taste, when they enriched a part
 of a house with marks of elegant habitation,
 which every spectator must know to be a cum-
 bersome garret: but their successors no less
 offend, who take off the cover of the house alto-
 gether, and make it impossible to know whether
 it is not a mere skreen or colonnade. The
 architect is anxious to present a fine object,
 and a very simple outline discusses all his con-
 cerns with the roof. He leaves it to the car-
 penter, whom he frequently puzzles (by his
 arrangements) with coverings almost impossible
 to execute. Indeed it is seldom that the idea of
 a roof is admitted by him into his great composi-
 tions. A pediment is often stuck up in the
 middle of a grand front, in a situation where a
 roof cannot perform its office; for the rain which
 is supposed to flow down its sides must be re-
 ceived on the top of the level buildings which
 flank it. This is a manifest incongruity. The
 tops of dressed windows, trifling porches, and
 sometimes a projecting portico, are the only
 situations in which we see the figure of a roof
 correspond with its office. Having thus lost
 sight of the principle, it is not surprising that
 the draughtsman (for he should not be called
 architect) runs into every whim: and we see
 pediment within pediment, a round pediment,
 a hollow pediment, and, the greatest of all absurdi-
 ties, a broken pediment, which is as ridiculous
 as a hat without its crown. But, when one
 builds a house, ornament alone will not do. We
 must have a cover; and the enormous expense
 and other inconveniences which attend the con-
 cealment of this cover by parapets, balustrades,
 and screens, have obliged architects to consider
 the pent roof as proper, and to regulate its form.
 A high pitched roof will undoubtedly shoot off
 the rains and snows better than one of a lower
 pitch. The wind will not so easily blow the
 dropping rain in between the slates, nor will it
 have so much power to strip them off. It will
 exert a smaller thrust on the walls, both because
 its strain is less horizontal, and because it will
 admit of lighter covering. But it is more ex-
 pensive, because there is more of it. It requires
 a greater size of timber to make it equally strong,
 and it exposes a greater surface to the wind.
 There have been great changes in the pitch
 of roofs: our forefathers made them very high,
 and we make them very low. It does not, however,
 appear that this change has been altogether
 the effect of principle. In the simple un-
 adorned habitations of private persons, every
 thing comes to be adjusted by an experi-

ence of inconveniences which have resulted from too low pitched roofs; and their pitch will always be nearly such as suits the climate and covering. Our architects, however, go to work on different principles. Their professed aim is to make a beautiful object. The sources of the pleasures arising from what we call taste are so various, so complicated, and so whimsical, that it is almost in vain to look for principle in the rules adopted by our professed architects. Much of their practice results from a pedantic veneration for the beautiful productions of Grecian architecture. Such architects as have written on the principles of the art in respect of proportions, or what they call the ordonnance, are much puzzled to make a chain of reasoning; and the most that they have made of the Greek architecture is, that it exhibits a nice adjustment of strength and strain. But, when we consider the extent of this adjustment, we find that it is wonderfully limited. The whole of it consists of a basement, a column, and an entablature; the entablature exhibits something of a connexion with the frame-work and roof of a wooden building; and it originated from this in the hands of the orientals, from whom the Greeks borrowed their forms and their combinations. We could easily show in the ruins of Persepolis, and among the tombs in the mountains (which were long prior to the Greek architecture), the fluted column, the base, the Ionic and Corinthian capital, and the Doric arrangement of lintels, beams, and rafters, all derived from unquestionable principle. The only addition made by the Greeks was the pent roof; and the changes made by them in the subordinate forms of things are such as might be expected from the exquisite judgment of beauty. But the whole of this is very limited; and the Greeks, after making the roof a chief feature of a house, went no further, and contented themselves with giving it a slope suited to their climate. This we have followed, because in the milder parts of Europe we have no cogent reason for deviating from it; and if any architect should deviate greatly, in a building where the outline is exhibited as beautiful, we should be disgusted: but the disgust, though felt by almost every spectator, has its origin in nothing but habit. In the professed architect or man of education the disgust arises from pedantry; for there is not such a close connexion between the form and uses of a roof as shall give precise determinations; and the mere form is a matter of indifference. We should not therefore reprobate the high-pitched roofs of our ancestors, particularly on the continent. It is there where we see them in all the extremity of the fashion, and the taste is by no means exploded as it is with us. A baronial castle in Germany and France is seldom rebuilt in the pure Greek style, or even like the modern houses in Britain; the high pitched roofs are retained. We should not call them Gothic, and ugly because Gothic, till we show their principle to be false or tasteless. It will be found quite the reverse; and that, though we cannot bring ourselves to think them beautiful, we ought to think them so. The construction of the Greek architecture is a transference of the practices that are necessary in a wooden building to a

building of stone. To this the Greeks have adhered, in spite of innumerable difficulties. Their marble quarries, however, put it in their power to retain the proportions which habit had rendered agreeable. But it is next to impossible to adhere to these proportions with free-stone or brick, when the order is of magnificent dimensions. Sir Christopher Wren saw this; for his mechanical genius was equal to his taste. He composed the front of St. Paul's church in London of two orders, and he coupled his columns; and still the lintels which form the architrave are of such length that they could carry no additional weight, and he was obliged to truss them behind. Had he made but one order, the architrave could not have carried its own weight. It is impossible to execute a Doric entablature of this size in brick. It is attempted in a very noble front, the Academy of Arts in St. Petersburg. But the architect was obliged to make the mutules and other projecting members of the cornice of granite, and many of them broke down by their own weight. Here is surely an error in principle. Since stone is the chief material of our buildings, ought not the members of ornamented architecture to be refinements on the essential and unaffected parts of a simple stone building? There is almost as much propriety in the architecture of India, where a dome is made in imitation of a lily or of some other flower inverted, as in the Greek imitation of a wooden building. The principles of masonry, and not of carpentry, should be seen in our architecture, if we would have it according to the rules of just taste. Now this is the characteristic feature of what is called the Gothic architecture. In this no dependence is had on the transverse strength of stone. No lintels are to be seen; no extravagant projections. Every stone is pressed to its neighbours, and none is exposed to a transverse strain. The Greeks were enabled to execute their colossal buildings only by using immense blocks of the hardest materials. The Norman mason could raise a building to the skies without using a stone which a laborer could not carry to the top on his back. The architects studied the principles of equilibrium; and, having attained a wonderful knowledge of it, they indulged themselves in exhibiting remarkable instances. We call this false taste, and say that the appearance of insecurity is the greatest fault. But this is owing to our habits; our thoughts may be said to run in a wooden train, and certain simple maxims of carpentry are familiar to our imagination; and in the careful adherence to these consists the beauty and symmetry of the Greek architecture. Had we been as much habituated to the equilibrium of pressure, this apparent insecurity would not have met our eye: we should have observed the strength, and we should have relished the ingenuity. The Gothic architecture is perhaps entitled to the name of rational architecture, and its beauty is founded on the characteristic distinction of our species. It deserves cultivation; not the pitiful, servile, and unskilled copying of the monuments; this will produce incongruities and absurdities equal to any that have crept into the Greek architecture; but let us examine with

attention the nice disposition of the groins and spandrels; let us study the tracery and knots, not as ornaments, but as useful members; let us observe how they have made their walls like honey-combs, and admire their ingenuity as we pretend to admire the instinct infused by the Great Architect into the bee. All this cannot be understood without mechanical knowledge; a thing which few of our professional architects have any share of. Thus would architectonic taste be a mark of skill; and the person who presents the design of a building would know how to execute it without committing it entirely to the mason and carpenter. The same principles of mutual pressure and equilibrium have a place in roofs and many wooden edifices; and if they had been as much studied as the Normans and Saracens seem to have studied such of them as were applicable to their purposes, we might have produced wooden buildings as far superior to what we are familiarly acquainted with, as the bold and wonderful churches still remaining in Europe are still superior to the timid productions of our stone architecture. The centres used in building the bridge of Orleans and the corn-market of Paris are instances of what may be done in this way. The last-mentioned is a dome of 200 feet diameter, built of fir planks; and there is not a piece of timber in it more than nine feet long, a foot broad, and three inches thick. The Norman architects frequently roofed with stone. Their wooden roofs were in general very simple, and their professed aim was to dispense with them altogether. Fond of their own science, they copied nothing from a wooden building, and ran into a similar fault with the ancient Greeks. The parts of their buildings which were necessarily of timber, were made to imitate stone-buildings; and Gothic ornament consists in cramming every thing full of arches and spandrels. Nothing else is to be seen in their timber works, nay even in their sculpture. Look at any of the maces or sceptres still to be found about the old cathedrals; they are all silver steeples. But there appears to have been a rivalry in old times between the masons and the carpenters. Many of the baronial halls are of prodigious width, and are roofed with timber: and the carpenters appeared to have borrowed much knowledge from the masons of those times, and their wide roofs are frequently constructed with great ingenuity. Their aim, like the masons, was to throw a roof over a very wide building without employing great logs of timber. We have seen roofs sixty feet wide without having a piece of timber in them above ten feet long and four inches square. They are very numerous on the continent. Indeed Britain retains few monuments of private magnificence. Aristocratic state never was so great with us; and the rancor of our civil wars gave most of the performances of the carpenter to the flames. Westminster Hall exhibits a specimen of the false taste of the Norman roofs. It contains the essential parts indeed, very properly disposed; but they are hidden, or intentionally covered, with what is conceived to be ornamental; and this is an imitation of stone arches, crammed in between slender pillars, which hang down from the principal frames, trusses, or

rafters. In a pure Norman roof, such as **Tarnaway Hall**, the essential parts are exhibited as things understood, and therefore relished. They are refined and ornamented; and it is here that the inferior kind of taste, or the want of it, may appear. We do not mean to defend all the whims of our ancestors, but we assert that it is no more necessary to consider the members of a roof as things to be concealed like a garret or privy, than the members of a ceiling, which form the most beautiful part of the Greek architecture. Should it be said that a roof is only a thing to keep off the rain, it may be answered, that a ceiling is only to keep off the dust, or the floor to be trodden under foot, and that we should have neither compartments in the one, nor inlaid work or carpets on the other. The structure of a roof may therefore be exhibited with propriety, and made an ornamental feature. This has been done even in Italy. The church of St. Maria Maggiore in Rome, and several others, are specimens; but the forms of the principal frames of these roofs, which resemble those of our modern buildings, are very unfit for agreeable ornament. Our imaginations have not been made sufficiently familiar with the principles, and we are rather alarmed than pleased with the appearance of the immense logs of timber which form the couples of these roofs, and hang over our heads with every appearance of weight and danger. It is quite otherwise with the ingenious roofs of the German and Norman architects. Slender timbers, interlaced with great symmetry, and thrown by necessity into figures which are naturally pretty, form altogether an object which no carpenter can view without pleasure. And why should the gentleman refuse himself the same pleasure of beholding scientific ingenuity? The roof is in fact the part of the building which requires the greatest degree of skill, and where science will be of more service than in any other part. The architect seldom knows much of the matter, and leaves the task to the carpenter. The carpenter considers the framing of a great roof as the touchstone of his art; and nothing indeed tends so much to show his judgment and his fertility of resource. It must therefore be very acceptable to the artist to have a clear view of the principles by which this difficult problem may be solved in the best manner, so that the roof may have all the strength and security that can be wished for, without an extravagant expense of timber and iron. Mechanical science can give great assistance in this matter. The framing of carpentry, whether for roofs, floors, or any other purpose, affords one of the most elegant and most satisfactory applications which can be made of mechanical science to the arts of common life. But the practical artist is seldom possessed even of the small portion of science which would almost insure his practice from all risk of failure; and even our most experienced carpenters have seldom any more knowledge than what arises from their experience, and natural sagacity. The most approved author in our language is Price, in his *British Carpenter*. Mathurin Jousse is in like manner the author most in repute in France: and the publications of both these authors are

void of every appearance of principle. It is not uncommon to see the works of carpenters of the greatest reputation tumble down, in consequence of mistakes from which elementary knowledge would have saved them. See ARCHITECTURE.

In the Middlesex Report on Architecture, it is observed, in speaking of the roofs of houses, that pantiles are so easily heated through by the sun, during the summer months, that the rooms underneath are as hot as an oven; while, in the winter season, in every common frost, these tiles are so completely frozen through as to become as cold as a covering of ice. These extremes must consequently have a very bad effect on the health of the inhabitants. The blue slates are so very thin as to be equally liable to the same objection, particularly as they are now laid on most of our fashionable houses, under Wyatt's patent. They are rather better when laid on in the common manner, that is, on double laths, but much better on boards. Plain tiles make a considerably more temperate covering for houses than either pantiles or slates, by reason of their being laid double and in mortar, and thereby forming a much thicker and closer roof. In this they are nearly equalled by the thick or stone slating of the midland counties; they might also be glazed of a slate color; in which case they would make a roof more handsome, temperate, and durable, than any other covering material now known.

Other substances have been had recourse to with this intention. In different parts of the country, cements of various kinds, and coarse paper laid over with resin, tar, &c., and other similar matters, have been tried, but with no very promising success as to their application. In some parts of Devonshire, though slate is by no means difficult to be procured, a substitute for that sort of covering is, Mr. Vancouver asserts, getting very much into use, which is prepared in the following manner:—Three parts of whitening, five of sand, one of pounded charcoal, and one of bone-ashes, to a barrel of common tar, to which are added four pounds of black resin; the two last materials are to be melted together, and, when boiling, the other ingredients are to be added in small quantities, keeping them constantly stirred and in motion over the fire, until the whole mass becomes of a consistence fit for use. Then the roof, being previously covered over with sheathing-paper securely nailed down, is to be carefully and evenly spread with the liquid hot from the copper, to the thickness of about three-quarters of an inch; which will cost, at the cauldron, about thirty-five shillings for each square of ten feet. The same measure of the common slate roof will cost about thirty-two shillings. The roofs for this sort of composition are pitched very flat, and, from the lightness of the scantling which is necessary in their construction, come considerably cheaper than those required for carrying slate or tiles. Materials of the reed and heath kinds have also been tried as coverings for the roofs of farm-houses and cottages, in places where they are capable of being procured in sufficient quantities for such purposes; and, though they are considerably more durable than common straw thatch, they

are subject to all the inconveniencies and objections of that sort of covering.

Thatch was formerly in general use for covering the roofs of all farm-buildings; but it is objectionable on many accounts, particularly as a hiding-place for insects, birds, and vermin; and as extremely perishable in its nature, subject to be much damaged by high winds, and of course liable to frequent repairs; and, above all, highly dangerous from its combustible nature. But Mr. Middleton thinks that it keeps out the summer's heat and winter's cold more effectually than any other material now in use; while, as it is not quite so compact and slightly as slates or tiles, and the straw being of such value for other purposes, it will probably be superseded by them. Tiles, though little exposed to danger from fire, do not, by any means, constitute a good roof, being ill calculated for preserving grain or other farm produce. In summer, they admit a heat very unfriendly to hay, corn, or straw; while, in winter, they are equally objectionable, on the ground of transmitting moisture in a high degree, while slates, though more expensive at first, are liable to none of these objections, especially when of the more thick kind. A roof covered with them, therefore, answers every useful purpose, and is very durable. For the construction of modern roofs, generally, see our article ARCHITECTURE, and more on the subject of farm-buildings under RURAL ARCHITECTURE.

ROOK, *n. s. & v. n.* } Sax. *pproc*; Goth. *rack*.
 ROOK'RY, } A bird resembling a crow,
 ROOK'Y, *adj.* } and feeding on grain;
 hence a robber or cheat: also a common man of chess: rookery is a nursery of rooks: rooky, inhabited by rooks.

Augurs, that understood relations, have,
 By magpies, and by coughts, and rooks, brought forth
 The secretest man of blood. *Shakspeare. Macbeth.*

Light thickens, and the crow
 Makes wing to the rooky wood. *Shakspeare.*

They rooked upon us with design,
 To out-reform and undermine. *Hudibras.*

Huge flocks of rising rooks forsake their food,
 And, crying, seek the shelter of the wood. *Dryden.*

So have I seen a knight at chess,
 His rooks and knights withdrawn,

His queen and bishops in distress,
 Shifting about grow less and less,

With here and there a pawn. *Id. Songs.*

How any one's being put into a mixed herd of unruly boys, and there learning to rook at span-farthing, fits him for conversation, I do not see.

Locke on Education.

I am, like an old rook, who is ruined by gaming, forced to live on the good fortune of the pushing young men. *Wycherley.*

No lone house in Wales, with a mountain and a rookery, is more contemptible than this court.

Pope.

The jay, the rook, the daw,
 Aid the full concert. *Thomson's Spring.*

ROOK, in ornithology. See CORVUS. Rooks are very destructive of corn, especially of wheat. They search out the lands where it is sown, and watching them more carefully than the owners, they perceive when the seed first begins to shoot up its blade; and, as soon as these blades appear, they are by them directed to the

places where the grains lie; and in three or four days they will root up such vast quantities that a good crop is often thus destroyed in embryo. After a few days, the wheat continuing to grow, its blades appear green above ground; and then the time of danger from these birds is over: for then the seeds are so far robbed or their mealy matter that they are of no value to that bird. The farmers, to drive away these mischievous birds, dig holes in the ground, and stick up the feathers of rooks in them, and hang up dead rooks on sticks in several parts of the fields; but all this is of little use, for the living rooks will tear up the ground about the feathers, and under the dead ones to steal the seeds. The best remedy is, to watch well the time of the corn being in the condition in which they feed upon it; and as this lasts only a few days, a boy should constantly watch the field from day-break till the dusk of the evening. Every time they settle upon the ground the boy should holloa, and throw up a dead rook into the air: this will always make them rise, and they will soon be so tired of this constant disturbance that they will seek out other places of preying, and will leave the ground even before the corn becomes unfit for them. The reason of their rising at the tossing up of the dead bird is, that they are extremely apprehensive of danger, and are always alarmed when one of them rises, and all fly off at the signal.

ROOKE (Lawrence), an eminent English astronomer, born at Deptford in Kent, in 1623; and educated at King's College, Cambridge, and at Oxford. In 1652 he was appointed Gresham professor of astronomy; and was also one of the founders of the Royal Society. He wrote astronomical tracts. He died in 1662.

ROOKE (Sir George), a naval commander, descended of an ancient and honorable family in Kent, was born in 1650. His merit raised him to be vice-admiral of the blue; in which station he served in the battle of La Hogue May 1692, and the next day he obtained still more glory by going into La Hogue, and burning the enemy's fleet, which he completely destroyed, together with most of the transports and ammunition vessels; and this under the fire of all the French batteries, and in sight of all the French and Irish troops; yet this bold action cost the lives of only ten men. The vice-admiral's behaviour on this occasion so pleased king William that, having no opportunity at that time of promoting him, he settled a pension of £1000 per annum on him for life; and afterwards, going to Portsmouth to view the fleet, went on board Rooke's ship, dined with him, and then conferred on him the honor of knighthood, he having a little before made him vice-admiral of the red. In consequence of other services he was in 1694 raised to the rank of admiral of the blue; towards the close of the next year he was made admiral of the white; and was also appointed admiral and commander-in-chief in the Mediterranean. During king William's reign, Sir George was twice elected M. P. for Portsmouth; and upon the accession of queen Anne, in 1702, he was constituted vice-admiral and lieutenant of the admiralty of England, as also lieutenant

of the fleets and seas of this kingdom. Upon the declaration of war against France, he was ordered to command a fleet sent against Cadiz, the duke of Ormond having the command of the land forces. On his passage home, receiving an account that the galleons, under the escort of a strong French squadron, were in the harbour of Vigo, he resolved to attack them: and on the 11th October came before the harbour of Rondondello, which the French commander had put into the best posture of defence. But, notwithstanding this, a detachment of fifteen English and ten Dutch ships of the line, with all the fire-ships were ordered in, and the army landed near Rondondello. The whole service was performed under Sir George's directions; all the ships were destroyed or taken, prodigious damage was done to the enemy, and great wealth acquired by the allies. For this action Sir George received the thanks of the house of commons, a day of thanksgiving was appointed both by the queen and the states general, and Sir George was promoted to a seat in the privy-council; yet, notwithstanding this, the house of lords resolved to enquire into his conduct at Cadiz. But he so fully justified himself that a vote was passed, approving his behaviour. In spring 1704 Sir George commanded the ships of war which conveyed king Charles III. of Spain to Lisbon. In July he attacked Gibraltar; when, by the bravery of the English seamen, the place was taken on the 24th, though the town was extremely strong, and well furnished with ammunition. The capture of this place was conceived and executed in less than a week, yet was then very little thought of; though it has since endured sieges of many months' continuance, and more than once baffled the united forces of France and Spain. Sir George soon after retired to his seat in Kent. He was thrice married; and by his second lady left one son. He died in 1709 in his fifty-eighth year, and was buried in Canterbury cathedral, where a monument is erected to his memory.

ROOM, *n. s.* } Sax. *rum*; Goth. *rum*. Space;
ROOMAGE, } extent of place great or small;
ROOMY, *adj.* } unoccupied space; way: roomage is an obsolete synonyme.

In evils that cannot be removed without the manifest danger of greater to succeed in their *room*, wisdom, of necessity, must give place to necessity.

Hooker.

Make *room*, and let him stand before our face.

Shakspeare.

If you will have a young man to put his travels in a little *room*, and in short time gather much, this he must do.

Bacon.

Man, of all sensible creatures, has the fullest brain to his proportion, for the lodging of the intellectual faculties: it must be a silent character of hope, when there is good store of *roomage* and receipt where those powers are stowed.

Wotton.

If when she appears in the room,
 Thou dost not quake, and art struck dumb,
 Know this,
 Thou lovest amiss;
 And, to love true,
 Thou must begin again, and love anew. *Shakspeare.*

What train of servants, what extent of field,
Shall aid the birth, or give him *room* to build?

Creech.

With new wonder now he views,
To all delight of human sense exposed
In narrow *room*, nature's whole wealth. *Milton.*

For better ends our kind Redeemer died,
Or the fallen angels *rooms* will be but ill supplied.

Roscommon.

In a prince's court, the only question a man is to
ask is, whether it be the custom of the court, or will
of the prince, to be uncovered in some *rooms* and not
in others? *Stillington.*

With *roomy* decks, her guns of mighty strength,
Deep in her draught, and warlike in her length.

Dryden.

This paternal regal power, being by divine right,
leaves no *room* for human prudence to place it any
where. *Locke.*

When this princess was in her father's court, she
was so celebrated that there was no prince in the
empire, who had *room* for such an alliance, that was
not ambitious of gaining her into his family.

Addison's Freeholder.

It puts us upon so eager a pursuit of the advan-
tages of life, as leaves no *room* to reflect on the great
author of them. *Atterbury.*

By contributing to the contentment of other men,
and rendering them as happy as lies in our power,
we do God's work, are in his place and *room*.

Calamy's Sermons.

The dry land is much too big for its inhabitants;
and that before they shall want *room* by increasing
and multiplying, there may be new heavens and a
new earth. *Bentley.*

It will afford me a few pleasant *rooms*, for such a
friend as yourself. *Pope.*

Will you not look with pity on me?
Is there no hope? is there no *room* for pardon?

A. Philips.

ROOME (Edward), an English writer, the
son of an undertaker in Fleet Street. He was
bred to the law, and became a violent party
writer. He wrote some papers entitled *Pasquin*,
wherein he offended Mr. Pope, who placed him
in the Dunciad. He succeeded Mr. Hornecks,
as solicitor to the treasury, October 18th 1728,
and died December 10th 1729. His *Jovial*
Crew was first acted in 1731.

ROOS (John Hendrick), a Dutch painter,
born at Orteburgh in 1631. His landscapes
have uncommon beauty. He also painted por-
raits. He died in 1685.

Roos (Philip), his son, was born in 1665, and
excelled his father greatly. His brother, John
Melchior, was also eminent in painting, and died
in 1731, aged seventy-two.

ROOST, *n. s. & v. n.* Sax. *prort*. That on
which a bird sits to sleep; the act of sleeping;
to sleep as a bird; lodge.

Sooner than the matin-bell was rung,
He clapped his wings upon his *roost* and sung.

Dryden.

A fox spied out a cock at *roost* upon a tree.

L'Estrange.

The cock *roosted* at night upon the boughs. *Id.*

Large and strong muscles move the wings, and
support the body at *roost*. *Derham's Phys. Theology.*

ROOT, *n. s., v. a., & v. n.* } Goth. and
ROOT'ED, } Swed. *rot*; Belg.
ROOT'EDLY, *adv.* } *roed*. That part
of the plant which rests in the ground, and sup-

plies it with nourishment; the original; first an-
cestor: to fix the root; strike deep; fix deep:
the adjective and adverb corresponding.

The multiplying brood of the ungodly shall not
take deep *rooting* from bastard slips, nor lay any fast
foundation. *Wisdom.*

Having this way eased the church, as they thought,
of superfluity, they went on till they had plucked up
even those things also which had taken a great deal
stronger and deeper *root*. *Hooker.*

It was said,

That myself should be the *root*, and father
Of many kings. *Shakspeare. Macbeth.*

Underneath the grove of sycamour,
That westward *rooteth*, did I see your son.

Shakspeare.

Pluck from the memory a *rooted* sorrow,
Raze out the written troubles of the brain. *Id.*
They all do hate him as *rootedly* as I. *Id.*

He's a rank weed,
And we must *root* him out. *Id. Henry VIII.*

The Egyptians think it sin to *root* up or to bite
Their leeks or onions, which they serve with holy
rite. *Raleigh's History of the World.*

When you would have many new *roots* of fruit
trees, take a low tree, and bow it, and lay all his
branches afloat upon the ground, and cast earth upon
them, and every twig will take *root*. *Bacon.*

After a year's *rooting*, then shaking doth the tree
good, by loosening of the earth. *Id.*

Why did my parents send me to the schools,
That I with knowledge might enrich my mind?
Since the desire to know first made men fools,
And did corrupt the *root* of all mankind. *Davies.*

The danger is great to them, who, on a weaker
foundation, do yet stand firmly *rooted*, and grounded
in the love of Christ. *Hammond's Fundamentals.*

Deep to the roots of hell the gathered breach
They fastened. *Milton.*

Whence,

But from the author of all ill, could spring
So deep a malice, to confound the race
Of mankind in one *root*? *Milton's Paradise Lost.*
Not to destroy, but *root* them out of heaven.

Milton.

If any irregularity chanced to intervene, and
cause misapprehensions, he gave them not leave to
root and fasten by concealment. *Fell.*

That the love of money is the *root* of all evil is a
truth universally agreed in. *Temple.*

A flower in meadow ground, amellus called;
And from one *root* the rising stem bestows
A wood of leaves. *Dryden's Virgil's Georgicks.*
That love took deepest *root* which first did grow.

Dryden.

When ocean, air, and earth, at once engage,
And *rooted* forests fly before their rage,
At once the clashing clouds to battle move. *Id.*

Root up wild olives from thy laboured lands. *Id.*
They were the *roots*, out of which sprang two
distinct people, under two distinct governments.

Locke.

In October, the hops will settle and strike *root*
against spring. *Mortimer's Husbandry.*

The coulter must be proportioned to the soil, be-
cause, in deep grounds, the weeds *root* the deeper.

Mortimer.

The layers will in a month strike *root*, being
planted in a light loamy earth. *Evelyn's Kalendar.*

These subterraneous vaults would be found espe-
cially about the *roots* of the mountains. *Burnet.*

The great important end that God designs it for,
the government of mankind, sufficiently shows the
necessity of its being *rooted* deeply in the heart, and

put beyond the danger of being torn up by any ordinary violence.

South.

In vain we plant, we build, our stores increase,
If conscience *roots* up all our inward peace.

Granville.

You always joined a violent desire of perpetually changing places with a *rooted* laziness.

Swift to Gay.

Those plants, whose *roots* are eaten, are carrots, turnips, and radishes.

Watts.

They have so *rooted* themselves in the opinions of their party, that they cannot hear an objection with patience.

Id.

Nor were the cole-worts wanting, nor the *root*,
Which after-ages call Hibernian fruit.

Harte.

ROOT. See BOTANY.

ROOT, in algebra and arithmetic, denotes any number which, multiplied by itself once or oftener, produces any other number; and is called the square, cube, biquadrate, &c., root, according to the number of multiplications. Thus 2 is the square-root of 4, the cube-root of 8, the biquadrate-root of 16, &c.

ROOT, SNAKE. See ARISTOLOCHIA.

ROPE, *n. s. & v. a.* } Sax. *pap*; Goth. *rep*;
ROPE-DANCER, } Swed. *reep*; Belg. *reip*,
ROPE-MAKER, } *roop*. A thick cord or
RO'PERY, *n. s.* } string; halter; cluster:
ROPE-TRICK, } to range; draw out:
RO'PINNESS, *n. s.* } ropery is used by Shaks-
RO'PY, *adj.* } peare for roguery: rope-

trick for a rogue's trick; or, as Johnson thinks, for tricks that deserve a halter: ropiness is viscosity; stringiness: ropy, glutinous; viscous: the other compounds the extracts will explain.

Thou drunken slave, I sent thee for a *rope*,
And told thee to what purpose.

Shakspeare.

The *rope-maker* bears me witness,
That I was sent for nothing but a *rope*.
What saucy merchant was this, that was so full
of his *ropery*?

Id.

Id. Merchant of Venice.

She may perhaps call him half a score knives or
so: an' he begin once, he'll rail in his *ropetricks*.

Shakspeare.

An anchor let down by a *rope*, maketh a sound;
and yet the *rope* is no solid body, whereby the sound
can ascend.

Bacon.

Such bodies partly follow the touch of another
body, and partly stick to themselves: and therefore
rope and draw themselves into threads; as pitch,
glue, and birdlime.

Id.

Salvian, amongst public shews, mentions the *Peta-*
menarii; probably derived from the Greek *πετασαί*,
to fly, and may refer to such kind of *ropedancers*.

Wilkins.

Who would, not guess there might be hopes,

The fear of gallowses and *ropes*

Before their eyes, might reconcile

Their animosities a while.

Hudibras.

In this close vessel place the earth accursed,

But filled brimful with wholesome water first,

Then run it through, the drops will *rope* around.

Dryden.

Ask for what price thy venal tongue was sold;

Tough, withered truffles, *ropy* wine, a dish

Of shotten herrings, or stale stinking fish.

Id.

I cannot but confess myself mightily surprized,
that, in a book which was to provide chains for all
mankind, I should find nothing but a *rope* of sand.

Locke.

Take care

Thy muddy bev'rage to serene, and drive

Precipitant the baser *ropy* lees.

Philips.

Statius, posted on the highest of the two summits,
the people regarded with terror, as they look upon a
daring *ropedancer*, whom they expect to fall every
moment.

Addison.

Hang yourself up in a true *rope*, that there may
appear no trick in it.

Arbuthnot.

The contents separated from it are sometimes *ropy*,
and sometimes only a grey and mealy, light sub-
stance.

Blackmore.

ROPE-MAKING is an art of great importance,
and there are few that better deserve the atten-
tion of the intelligent observer. Hardly any
trade can be carried on without the assistance of
the rope-maker. Cordage makes the very sinews
and muscles of a ship; and every improvement
which can be made in its preparation, either in
respect to strength or pliability, must be of im-
mense service to the mariner, and to the com-
merce and defence of nations.

Rope-making has been defined the art of
uniting animal or vegetable fibres into an aggre-
gate line, so that the whole may concur in one
joint action, and be employed under the forms of
string, cord, cable, &c. Animal fibres, on ac-
count of their expense, are but seldom used, but
those that are introduced into the employment
are obtained either from the intestines or the
hair. The intestines of sheep and lambs are
manufactured into what is called cat-gut, of dif-
ferent sizes, for the use of musical-instrument-
makers, for watch-makers, opticians, cutlers,
turners, and a variety of other artificers. The
tendrils of the ovary of the squalus canicula, or
dog-fish, are chiefly employed in angling, more
frequently single than in the combined state,
known in the trade by the name of Indian-grass.
Animal hair, as that from horses, is had recourse
to where there is no great friction, and it forms a
rope or cord much more durable than any that
can be obtained from vegetables; it is impervious
to moisture is capable of resisting all weathers,
and is extremely elastic. Hence it is obvious that
the rope-maker must derive his chief material
from the vegetable kingdom; which he does from
the inner bark of the hemp, or *cannabis sativa*;
or from that of some of the species of flax, or
linum; that of the *L. usitissimum* is the most
important. The treatment of both these plants
being nearly the same, we shall describe, as
nearly as we can, that relating to flax. The plant
is rather common in most of the temperate parts
of Europe, flowering in July. The root is an-
nual, fibrous, and small; the stem is erect, round,
smooth, and leafy; the flowers on stalks erect,
and of a sky-blue color. About the end of Au-
gust, when the flowers have attained their full
growth, and begin to turn yellow at bottom, and
brown at the top, and their seeds to ripen, it is a
proper time to pull the plants up. They are
dried and threshed; they are then to be put in
water till the bark readily separates from the
stalk, when they are taken out and dried, after
which they are in a proper state for the purpose
of being converted into flax by the hackler. We
may observe, though not strictly connected with
the subject in hand, that, as from the bark of the
stalks is manufactured flax or lint, for making of
all sorts of linen cloth;—from cloth, when worn
out, we make our paper; from the seeds of the

plant linseed oil is expressed; and even the refuse, after the oil is extracted, forms oil-cakes, so valuable in fattening cattle, sheep, and other live stock. From hemp, however, treated in a similar way, we have the materials for cordage, ropes, and cables. Russian hemp is most used, but English hemp, when properly manufactured, is superior to that introduced from the north.

The aim of the rope-maker is to unite the strength of a great number of fibres, and the first part of his process is spinning of rope-yarns; that is, twisting the hemp in the first instance. This is done in various ways, and with different machinery, according to the nature of the intended cordage. We shall confine our description to the manufacture of the larger kinds, such as are used for the standing and running rigging of ships. An alley, or walk, is enclosed for the purpose, about 200 fathoms long, and of a breadth suited to the extent of the manufacture. It is sometimes covered above. At the upper end of this rope-walk is set up the spinning-wheel. The band of the wheel goes over several rollers, called whirls, turning on pivots in brass holes. The pivots at one end come through the frame, and terminate in little hooks. The wheel, being turned by a winch, gives motion in one direction to all the whirls. The spinner has a bundle of dressed hemp round his waist, with the two ends meeting before him. The hemp is laid in this bundle in the same way that women spread the flax on the distaff. There is great variety in this; but the general aim is to lay the fibres in such a manner, that, as long as the bundle lasts, there may be an equal number of the ends at the extremity, and that a fibre may never offer itself double, or in a bight. The spinner draws out a proper number of fibres, twists them with his fingers, and, having got a sufficient length detached, he fixes to the hook of a whirl. The wheel is now turned, and the skein is twisted, becoming what is called rope-yarn, and the spinner walks backwards down the rope-walk. The part already twisted draws along with it more fibres out of the bundle. The spinner aids this with his fingers, supplying hemp in due proportion, as he walks away from the wheel, and taking care that the fibres come in equally from both sides of his bundle, and that they enter always with their ends, and not by the middle, which would double them. He should also endeavour to enter every fibre at the heart of the yarn. This will cause all the fibres to mix equally in making it up, and will make the work smooth, because one end of each fibre is, by this means, buried among the rest, and the other end only lies outward; and this, in passing through the grasp of the spinner, who presses it tight with his thumb and palm, is also made to lie smooth. A good spinner endeavours always to supply the hemp in the form of a thin flat skein, with his left hand, while his right hand is employed in grasping firmly the yarn that is twisting off, and in holding it tight from the whirl, that it may not run into loops or kinks. It is evident that both the arrangement of the fibres, and the degree of twisting, depend on the skill and dexterity of the spinner, and that he must be instructed, not by a book, but by a

master. The degree of twist depends on the rate of the wheel's motion, combined with the retrograde walk of the spinner. We may suppose him arrived at the lower end of the walk, or as far as is necessary for the intended length of his yarn. He calls out, and another spinner immediately detaches the yarn from the hook of the whirl, and gives it to another, who carries it aside to the reel; and this second spinner attaches his own hemp to the whirl-hook. In the mean time, the first spinner keeps fast hold of the end of his yarn; for the hemp, being dry, is very elastic, and, if he were to let it go out of his hand, it would instantly untwist, and become little better than loose hemp. He waits, therefore, till he sees the reeler begin to turn the reel, and he goes slowly up the walk, keeping the yarn of an equal tightness all the way, till he arrives at the wheel, where he waits with his yarn in his hand till another spinner has finished his yarn. The first spinner takes it off the whirl-hook, joins it to his own, that it may follow it on the reel, and begins a new yarn. The second part of the process is the conversion of the yarns into what may with propriety be called a rope, cord, or line. That we may have a clear conception of the principle which regulates this part of the process, we shall begin with the simplest possible case—the union of two yarns into one line.

When hemp has been split into very fine fibres by the hatchet, it becomes exceedingly soft and pliant, and, after it has lain for some time in the form of fine yarn, it may be unreeling and thrown like flaxen yarn, so as to make sewing-thread. It is in this way, indeed, that the sail-makers' sewing-thread is manufactured, and when it has been kept on the reel, or on balls or bobbins, for some time, it retains its twist as well as its uses require. But this is by no means the case with yarns spun for great cordage. The hemp is so elastic, the number of fibres twisted together is so great, and the diameter of the yarn (which is a sort of lever on which the elasticity of the fibre exerts itself) is so considerable, that no keeping will make the fibres retain this constrained position.

The end of a *rope-yarn* being thrown loose, it will immediately untwist, and this with considerable force and speed. It would, therefore, be a fruitless attempt to twist two such yarns together; yet the ingenuity of man has contrived to make use of this very tendency to untwist, not only to counteract itself, but even to produce another and a permanent twist, which requires force to undo it, and which will recover itself when this force is removed. Every person must recollect that, when he has twisted a packthread very hard with his fingers between his two hands, if he slackens the thread by bringing his hands nearer together, the packthread will immediately curl up, running into loops or kinks, and will even twist itself into a neat and firm cord. The component parts of a rope are called strands, and the operation of uniting them with a permanent twist is called laying or closing, the latter term being chiefly appropriated to cables and other very large cordage.

The process of laying or closing large cordage

is thus conducted : the strands of which the rope is composed consist of many yarns, and require a considerable degree of hardening. This cannot be done by a whirl driven by a wheel-band ; it requires the power of a crank turned by the hand. The strands, when properly hardened, become very stiff, and, when bent round the top, are not able to transmit force enough for laying the heavy and unpliant rope which forms beyond it. The elastic twist of the hardened strands must therefore be assisted by an external force. All this requires a different machinery and a different process. At the upper end of the walk is therefore fixed a tackle-board ; this consists of a strong oaken plank, called a breast-board, having three or more holes in it and fitted with brass or iron plates. Into these are put iron cranks called heavers, which have hooks or forelocks, and keys on the ends of their spindles. They are placed at such a distance from each other that the workmen do not interfere while turning them round. This breast-board is fixed to the top of strong posts, well secured by struts or braces facing the lower end of the walk. At the lower end is another breast-board fixed to the upright post of a sledge, which may be loaded with stones or other weights. Similar cranks are placed in the holes of this breast-board ; the whole goes by the name of the sledge.

The top necessary for closing large cordage is too heavy to be held in the hand, it therefore has a long staff, which has a truck on the end. This rests on the ground, but even this is not enough in laying great cables. The top must be supported on a carriage, where it must lie very steady, and it needs attendance, because the master workman has sufficient employment in attending to the manner in which the strands close behind the top, and in helping them by various methods. The top is therefore fixed to the carriage by lashing its staff to the two upright posts. A piece of soft rope or strap is attached to the handle of the top by the middle, and its two ends are brought back and wrapped several times tight round the rope in the direction of its twist, and bound down. This greatly assists the laying of the rope by its friction, which both keeps the top from flying too far from the point of union of the strands, and brings the strands more regularly into their places. The first operation is warping the yarns. At each end of the walk are frames called warping frames, which carry a great number of reels, or winches, filled with rope-yarn. The foreman of the walk takes off a yarn end from each, till he has made up the number necessary for his rope or strand, and, bringing the ends together, he passes the whole through an iron ring fixed to the top of a stake driven into the ground, and draws them through ; then a knot is tied on the end of the bundle, and a workman pulls it through this ring till the intended length is drawn off the reels. The end is made fast at the bottom of the walk, or at the sledge, and the foreman comes back along the skein of yarns, to see that none are hanging slacker than the rest. He takes up in his hand such as are slack and draws them tight, keeping them so till he reaches the upper end, where he cuts the yarns

to a length, again adjusts their tightness, and joins them all together in a knot, to which he fixes the hook of a tackle, the other block of which is fixed to a firm post, called the warping-post. The skein is well stretched by the tackle, and then separated into its different strands. Each of these is knotted apart at both ends. The knots at their upper ends are made fast to the hooks of the cranks in the tackle-board, and those at the lower ends are fastened to the cranks in the sledge. The sledge itself is kept in its place by a tackle, by which the strands are again stretched in their places and every thing adjusted, so that the sledge stands square on the walk, and then a proper weight is laid on it. The tackle is now cast off, and the cranks are turned at both ends in the contrary direction to the twist of the yarns (in some kinds of cordage the cranks are turned the same way with the spinning twist). By this the strands are twisted and hardened up, and as they contract by this operation the sledge is dragged up the walk. When the foreman thinks the strands sufficiently hardened, which he estimates by the motion of the sledge, he orders the heavers at the cranks to stop. The middle strand at the sledge is taken off from the crank ; this crank is taken out, and a stronger one put in its place. The other strands are taken off from their cranks, and all are joined on the hook which is now in the middle hole ; the top is then placed between the strands, and, being pressed home to the point of their union, the carriage is placed under it, and it is firmly fixed down ; some weight is taken off the sledge. The heavers now begin to turn at both ends ; those at the tackle-board continue to turn as they did before, but the heavers at the sledge turn in the opposite direction to their former motion, so that the cranks at both ends are now turning one way. By the motion of the sledge-crank the top is forced away from the knot, and the rope begins to close. The heaving at the upper end restores to the strands the twist which they are constantly losing by the laying of the rope. The workmen judge of this by making a chalk mark on the intermediate points of the strands, where they lie on the stakes which are set up along the walk for their support. If the twist of the strands is diminished by the motion of closing they will lengthen, and the chalk mark will move away from the tackle-board ; but, if the twist increases by turning the cranks at the tackle-board, the strands will shorten and the mark will come nearer to it. As the closing of the rope advances the whole shortens, and the sledge is dragged up the walk. The top moves faster, and at last reaches the upper end of the walk, the rope being now laid.

In the mean time the sledge has moved several fathoms from the place where it was when the laying began. These motions of the sledge and top must be exactly adjusted to each other. The rope must be of a certain length, therefore the sledge must stop at a certain place. At that moment the rope should be laid ; that is, the top should be at the tackle-board. In this consists the address of the foreman. He has his attention directed both ways. He looks at the strands,

and, when he sees any hanging slacker between the stakes than the others, he calls to the heavers at the tackle-board to heave more upon that strand. He finds it more difficult to regulate the motion of the top. It requires a considerable force to keep it in the angle of the strands, and it is always disposed to start forward. To prevent or check this, some straps of soft rope are brought round the staff of the top, and then wrapped several times round the rope behind the top, and kept firmly down by a lanyard or bandage. This both holds back the top and greatly assists the laying of the rope, causing the strands to fall into their places, and keep close to each other, which is sometimes very difficult, especially in ropes composed of more than three strands. It will greatly improve the laying the rope, if the top has a sharp, smooth, tapering pin of hard wood, pointed at the end, projecting so far from the middle of its smaller end that it gets in between the strands which are closing. This supports them, and makes their closing more gradual and regular. The top, its notches, the pin, and the warp or strap, which is lapped round the rope, are all smeared with grease or soap, to assist the closing. The foreman judges of the progress of closing chiefly by his acquaintance with the walk, knowing that when the sledge is a-breast of a certain stake the top should be a-breast of a certain other stake. When he finds the top too far down the walk he slackens the motion at the tackle-board, and makes the men turn briskly at the sledge. By this the top is forced up the walk, and the laying of the rope accelerates, while the sledge remains in the same place, because the strands are losing their twist, and are lengthening, while the closed rope is shortening. When, on the other hand, he thinks the top too far advanced, and fears that it will be at the head of the walk before the sledge has got to its proper place, he makes the men heave briskly on the strands, and the heavers at the sledge crank work softly. This quickens the motion of the sledge by shortening the strands; and, by thus compensating what has been overdone, the sledge and top come to their places at once, and the work appears to answer the intention. When the top approaches the tackle-board the heaving at the sledge could not cause the strands immediately behind the top to close well, without having previously produced an extravagant degree of twist in the intermediate rope. The effort of the crank must, therefore, be assisted by men stationed along the rope, each furnished with a tool called a woolder. This is a stout oaken stick, about three feet long, having a strap of soft rope-yarn or cordage, fastened on its middle or end. The strap is wrapped round the laid rope, and the workman works with the stick as a lever, twisting the rope round in the direction of the crank's motion. The woolders should keep their eye on the man at the crank, and make their motion correspond with his. Thus they send forward the twist produced by the crank, without either increasing or diminishing it, in that part of the rope which lies between them and the sledge. Such is the general and essential process of rope making.

The fibres of hemp are twisted into yarns, that they may make a line of any length, and stick among each other with a force equal to their own cohesion. The yarns are made into cords of permanent twist by laying them; and that we may have a rope of any degree of strength many yarns are united in one strand, for the same reason that many fibres were united in one yarn; and in the course of this process it is in our power to give the rope a solidity and hardness which make it less penetrable by water, which would rot it in a short while. Some of these purposes are inconsistent with others: and the skill of a rope-maker lies in making the best compensation, so that the rope may, on the whole, be the best in point of strength, pliancy, and duration, that the quantity of hemp in it can produce. The following rule for judging of the weight which a rope will bear is not far from the truth. It supposes them rather too strong; but it is so easily remembered that it may be of use. Multiply the circumference in inches by itself, and take the fifth part of the product, it will express the tons which the rope will carry. Thus, if the rope has six inches circumference, six times six is thirty-six, the fifth of which is seven tons and one-fifth.

It is usual in *cables*, and in other cases, to have recourse to the operation of tarring. This is often done in the state of twine or yarn, as being the best mode by which the hemp can be uniformly penetrated. The yarn is made to wind off from one reel, and, having passed through a vessel of liquid hot tar, is wound on another reel; the superfluous tar is taken off by passing through a hole surrounded with oakum: or it is sometimes tarred in skeins, which are drawn by a capstern through a tar-kettle, and a hole formed by two plates of metal, held together by a lever, loaded with a weight. There is this peculiarity to be noticed—tarred cordage is weaker, when new, than white, and the difference increases by the keeping. From some very accurate experiments made more than half a century ago, it was found that, on newly-made cordage, the white was one-eighth stronger than that which was tarred; that, at the expiration of three months, the difference in favor of the new was almost one-fourth; and, in about three years and a half, the difference was as twenty-nine to eighteen. From these, and other experiments, it was ascertained, 1. That white cordage in continual service is one-third more durable than that which is subjected to the operation of tarring. 2. That it retains its strength much longer while kept in the warehouse. 3. That it resists the ordinary injuries of the weather one-fourth longer. It may then be asked, Why is tar ever used by the rope-maker? Because white cordage, when exposed to be alternately very wet and dry, is weaker than that which is tarred, and to this cables and ground-tackle are continually subjected. It has also been pretty well ascertained that cordage which is only superficially tarred is constantly stronger than that which is tarred throughout.

Before we conclude this article we may notice Mr. Chapman's method of making ropes and cordage, for which he obtained, some years since,

his majesty's letters patent. The specifications may be found in the ninth volume of the First Series of the Repertory. It is too long to be admitted in our work; the following is, however, an outline of the whole:—

Rope-yarns are spun either by hand, or by machinery: in the practice of the first method rope-walks are necessary, and the fibres of the hemp are drawn into the yarn of different lengths proportionate in a given degree to their position on the outside or inside of the yarn; accordingly, when this yarn is strained, and its diameter collapses, the inside fibres of hemp bear the greatest strain, and thus they break progressively from the inside. In the spinning by a mill the fibres are all brought forward in a position parallel to each other, previously to their receiving their twist. They are consequently all of one length; and, when twisted, the outside fibres are most shortened by forming the same number of spirals round a greater axis than the interior, and thus they must consequently break the first, on the same principle that the outside yarns of strands of ropes manufactured in the old method break before the interior yarns; and consequently with less strain than ropes of the improved principle, where the strands (or immediate component parts of the rope) have been formed in such a manner as that all the yarns shall bear equally at the time of the rope's breaking. Nevertheless yarns spun by a mill have been found stronger than common yarns, on account of the great evenness with which they are spun; the manual labor in manufacturing is much less than in the common method: but on the other hand there is the expense of machinery, and the greater waste of hemp in preparing it for being drawn out in the progressive stages of its advance to the spindle.

The method invented by Mr. Chapman differs from both the preceding, in causing, by an easy and simple contrivance, the fibres of the hemp to be laid in the yarn in such a manner as the yarns themselves are laid in the strands of the rope manufactured on the new principle. The machinery consists only of a spindle divided into two parts, the upper containing apparatus to draw forward the hemp from the spinner with twist sufficient to combine the fibres; which enables him to employ women, children, and invalids, and also to appropriate the rope-ground solely to the purpose of laying ropes. The remaining parts of the invention consist chiefly in giving from a stationary power internal motion to a loco-motive machine, viz. to the roper's sledge, on which the strands and the rope itself are twisted, by which contrivance they are enabled to apply a water-wheel or steam-engine to the whole process of making ropes of all kinds whatever.

Mr. Huddart likewise obtained a patent for an improved method of registering or forming strands in the machinery for manufacturing of cordage; which he effects in the following manner:—1. By keeping the yarns separate from each other, and drawing them from bobbins which revolve to keep up the twist whilst the strand is forming. 2. By passing them through a register, which divides them by circular shells of holes; the number in each shell being agree-

able to the distance from the centre of the strand, and the angle which the yarns make with a line parallel to it, and which gives them a proper position to enter. 3. A cylindrical tube which compresses the strand, and maintains a cylindrical figure to its surface. 4. A gauge to determine the angle which the yarns in the outside shall make with a line parallel to the centre of the strand when registering; and, according to the angle made by the yarns in this shell, the length of all the yarns in the strand will be determined. 5. By hardening up the strand, and thereby increasing the angle in the outside shell, which compensates for the stretching of the yarns and the compression of the strand.

ROPE-YARN, among sailors, is the yarn of any rope untwisted, but commonly made up of junk: its use is to make sinnet, mats, &c.

ROQUELAURE, *n. s.* Fr. *roquelaure*. A cloak for men.

Within the *roquelaure's* clasp thy hands are pent.
Gay.

RORAAS, an inland town of Norway, in the bishopric of Drontheim. It stands on a high mountain the most elevated inhabited situation in the country. Frost and snow prevail during almost the whole year. It contains 3000 inhabitants, principally occupied in the copper mines of the neighbourhood. Sixty-seven miles S. S. E. of Drontheim.

RORID, *adj.* Lat. *roridus*. Dewy.

A vehicle conveys it through less accessible cavities into the liver, from thence into the veins and so in a *rorid* substance through the capillary cavities.

Brown's Vulgar Errors.

RORIDULA, in botany, a genus of the monogynia order, and pentandria class of plants: cor. pentapetalous: cal. pentaphyllous: caps. bivalved; the antheræ scrotiform at the base. Species one only, a Cape shrub.

ROSA (Salvator), a celebrated painter, born in Naples in 1614. He was first instructed by Francis Francazano, a kinsman: but the death of his father reduced him to sell drawings sketched upon paper, one of which falling into the hands of Lanfranc, he took him under his protection, and enabled him to enter the school of Spagnoletto, where he was taught by Daniel Falcone, a distinguished painter of battles at Naples. Salvator had a fertile imagination. He studied nature with attention and judgment; and always represented her to the greatest advantage. He was equally eminent for painting battles, animals, sea or land storms; and he executed these different subjects in a style altogether unequalled. His pieces are exceedingly scarce and valuable; one of the finest is that representing Saul and the witch of Endor, which was preserved at Versailles. He died in 1673; and, as his paintings are in few hands, he is more generally known by his prints; of which he etched a great number. They are chiefly historical. He is said to have spent the early part of his life among a troop of banditti; and that the rocky desolate scenes in which he was accustomed to take refuge furnished him with those romantic ideas in landscape, in the representation of which he so greatly excels. His robbers, as his detached figures are commonly called, are supposed also

to have been taken from the life. He was also a musician; as appears from his musical MSS. purchased at Rome by Dr. Burney.

Rosa, in botany, the rose, a genus of the polygamia order, and icosandria class of plants; natural order thirty-fifth, senticosæ: CAL. urceolated, quinquefid, corneous, and straightened at the neck; petals five. The SEEDS are numerous, hispid, and affixed to the inside of the calyx. The different kinds of roses are very numerous; and botanists find it very difficult to determine with accuracy which are species and which are varieties. On this account Linné, and some other eminent authors, are inclined to think that there is only one real species of rose, which is the *rosa canina*, or dog-rose of the hedges, &c., and that all the other sorts are accidental varieties of it. However, according to the Linnæan arrangement, they stand divided into fourteen species, each comprehending varieties, which in some sorts are but few, in others numerous. The supposed species and their varieties, according to the arrangement of Gmelin, are as follow:—

1. *R. alba*, the common white rose, grows five or six feet high, having a green stem and branches, armed with prickles, hispid pedunculi, oval smooth germina, and large white flowers. The varieties are, large double white rose, dwarf single white rose, maiden's-blush white rose, being large, produced in clusters, and of a white and bluish red color.

2. *R. alpina*, the alpine inermous rose, grows five or eight feet high, having smooth or unarmed reddish branches, pinnated seven-lobed smooth leaves, somewhat hispid pedunculi, oval germina, and deep-red single flowers; appearing in May. This species, as being free from all kind of armature common to the other sorts of roses, is esteemed as a singularity; and from this property is often called the virgin or thornless rose.

3. *R. canina*, the canine rose, wild dog-rose of the hedges, or hep-tree, grows five or six feet high, having prickly stalks and branches, pinnated, five or seven-lobed leaves, with aculeated foot-stalks, smooth pedunculi, oval smooth germina, and small single flowers. There are two varieties, red-flowered and white-flowered. They grow wild in hedges abundantly all over the kingdom; and are sometimes admitted into gardens, to increase the variety of the shrubby collection.

4. *R. Carolinensis*, the Carolina and Virginia rose, &c., grows six or eight feet high, or more, having smooth reddish branches, very thinly aculeated; pinnated seven-lobed smooth leaves, with prickly foot-stalks; somewhat hispid pedunculi, globose hispid germina, and single red flowers in clusters, appearing mostly in August and September. The varieties are, dwarf Pennsylvanian rose, with single and double red flowers, and American pale-red rose. This species grows naturally in different parts of North America, and often continues in blow from August until October; and the flowers are succeeded by numerous red berry-like hews in autumn, causing a variety all winter.

5. *R. centifolia*, the hundred-leaved red rose,

&c., grows from about three or four to six or eight feet high, with pinnated three and five-lobed leaves; and large very double red flowers, having very numerous petals, and of different shades in the varieties. The varieties are, common Dutch hundred-leaved rose, grows three or four feet high, with erect greenish branches, but moderately armed with prickles; and large remarkably double red flowers, with short regularly arranged petals. Blush hundred-leaved rose, grows like the other, with large very double pale-red flowers. Provence rose grows five or six feet with greenish-brown prickly branches, and very large double globular red flowers, with large petals folding over one another, more or less in the varieties. The varieties are, common red Provence rose, and pale Provence rose; both of which having larger and somewhat looser petals than the following sort:—cabbage Provence rose; having the petals closely folded over one another like cabbages. Dutch cabbage rose, very large. Chidding Provence rose. Great royal rose, grows six or eight feet high, producing remarkably large, somewhat loose, but very elegant flowers. All these are large double red flowers, somewhat globular at first blowing, becoming gradually a little spreading at top, and are very ornamental fragrant roses. Moss Provence rose, supposed a variety of the common rose; grows erectly four or five feet high, having brownish stalks and branches, very closely armed with short prickles, and double crimson-red flowers; having the calyx and upper part of the peduncle surrounded with a rough mossy-like substance, effecting a curious singularity. This is a fine delicate rose, of a high fragrance, which, together with its mossy calyx, renders it a most beautiful flower.

6. *R. cinnamomea*, the cinnamon rose, grows five or six feet high, or more, with purplish branches thinly aculeated; pinnated five or seven lobed leaves, having almost inermous petioles, smooth pedunculi, and smooth globular germina; with small purplish red cinnamon-scented flowers early in May. There are varieties with double flowers.

7. *R. eglanteria*, the eglantine rose or sweet briar, grows five or six feet high, having green branches, armed with strong spines sparsedly; pinnated seven-lobed odoriferous leaves, with acute folioles and rough foot-stalks, smooth pedunculi, globular smooth germina, and small pale-red flowers. The varieties are, common single flowered, semi-double flowered, double-flowered, blush double-flowered, and yellow-flowered. This species grows naturally in some parts of England, and in Switzerland. It claims culture in every garden for the odoriferous property of its leaves: and should be planted in the borders, and other compartments contiguous to walks, or near the habitation, where the plants will impart their refreshing fragrance very profusely around; and the young branches are excellent for improving the odor of nosegays and bow-pots.

8. *R. gallica*, the gallican rose, &c., grows from about three or four to eight or ten feet high, in different varieties; with pinnated, three, five, or seven-lobed leaves, and large red and

other colored flowers in different sorts. This species is very extensive in supposed varieties, bearing the above specific distinction, several of which have been formerly considered as distinct species, but are now ranged among the varieties of the Galician rose, consisting of the following noted varieties: common red officinal rose, grows erect, about three or four feet high, having small branches, with but few prickles, and large spreading half-double deep red flowers. *Rosa mundi* (rose of the world) or striped red rose is a variety of the common red rose, growing but three or four feet high, having large spreading semi-double red flowers, beautifully striped with white and deep red. York and Lancaster variegated rose grows five, six, or eight feet high, or more; bearing variegated red flowers, consisting of a mixture of red and white; also frequently disposed in elegant stripes, sometimes in half of the flower, and sometimes in some of the petals. Monthly rose grows about four or five feet high, with green very prickly shoots; producing middle-fixed, moderately double, delicate flowers, of different colors in the varieties. The varieties are, common red-flowered monthly rose, bluish-flowered, white-flowered, and stripe-flowered. All of which blow both early and late, and often produce flowers several months in the year, as May, June, and July; and frequently again in August or September, and sometimes, in fine mild seasons, continue till November or December: hence the name monthly rose. Double-virgin rose grows five or six feet high, having greenish branches with scarcely any spines; and with large double pale-red and very fragrant flowers. Red damask-rose grows eight or ten feet high, having greenish branches, armed with short aculea; and moderately double, fine soft red, very fragrant flowers. White damask-rose grows eight or ten feet high, with greenish very prickly branches, and whitish-red flowers, becoming gradually of a whiter color. Blush Belgic rose grows three or four feet high, or more; having greenish prickly branches, five or seven-lobed leaves, and numerous, very double, bluish-red flowers, with short petals, evenly arranged. Red Belgic rose, having greenish and red shoots and leaves, and fine double deep-red flowers. Velvet rose grows three or four feet high, armed with but few prickles, producing large velvet-red flowers comprising semi-double and double varieties, all very beautiful roses. Marbled rose grows four or five feet high, having brownish branches, with but few prickles; and large, double, finely-marbled, red flowers. Red-and-yellow Austrian rose grows five or six feet high, having slender reddish branches, armed with short brownish aculea; and with flowers of a reddish copper-color on one side, the other side yellow. Yellow Austrian rose grows five or six feet high, having reddish very prickly shoots, and numerous bright-yellow flowers. Double yellow rose grows six or seven feet high; with brownish branches, armed with numerous large and small yellowish prickles; and large very double yellow flowers. Francfort rose grows eight or ten feet high, is a vigorous shooter, with brownish branches thinly armed with strong prickles, and produces largish double

purplish-red flowers, that blow irregularly, and have but little fragrance.

9. *R. moschata*, the musk-rose, supposed to be a variety only of the ever-green musk-rose, has weak smooth green stalks and branches, rising by support from six to eight or ten feet high, or more thinly armed with strong spines, pinnated seven-lobed smooth leaves, with prickly foot-stalks, hispid peduncles, oval hispid germen; and all the branches terminated by large umbellated clusters of pure-white musk-scented flowers, in August, &c.

10. *R. pimpinellifolia*, the burnet-leaved rose, grows about a yard high, aculeated sparsely; small neatly pinnated seven lobed leaves, having obtuse folioles and rough petioles, smooth peduncles, a globular smooth germen, and small single flowers. There are varieties with red flowers, and with white flowers. They grow wild in England, &c., and are cultivated in shrubberies for variety.

11. *R. sempervirens*, the ever-green musk rose, has a somewhat trailing stalk and branches, rising by support five or six feet high or more, having a smooth bark armed with prickles; pinnated five-lobed smooth shining ever-green leaves, with prickly petioles, hispid pedunculi, oval hispid germen; and all the branches terminated by clusters of pure white-flowers of a musky fragrance; appearing in the end of July, and in August. The ever-green property of this elegant species renders it a curiosity; it also makes a fine appearance as a flowering shrub. There is one variety, the deciduous musk-rose. This species and variety flower in August, and are remarkable for producing in numerous clusters, continuing in succession till October or November.

12. *R. spinosissima*, the most spinous, dwarf burnet-leaved rose, commonly called Scotch rose, grows but two or three feet high, very closely armed with spines; small neatly pinnated seven-lobed leaves, with prickly foot-stalks, prickly pedunculi, oval smooth germen, and numerous small single flowers, succeeded by round dark-purple hips. The varieties are common white-flowered, red-flowered, striped-flowered, and marble-flowered. They grow naturally in England, Scotland, &c. The first variety rises nearly a yard high, the others about one or two feet, all of which are single-flowered; but the flowers, being numerous all over the branches, make a pretty appearance in the collection.

13. *R. villosa*, the villose apple-bearing rose, grows six or eight feet high, having strong erect brownish-smooth branches, aculeated sparsely; pinnated seven-lobed villose or hairy leaves, downy underneath, with prickly foot-stalks, hispid peduncles, a globular prickly germen; and large single red flowers, succeeded by large round prickly hips, as big as little apples. This species merits admittance into every collection as a curiosity for the singularity of its fruit, both for variety and use; for it, having a thick pulp of an agreeable acid relish, is often made into a tolerably good sweetmeat. The above thirteen species of *rosa*, and their respective varieties, are of the shrub kind; all deciduous except *R. sempervirens*, and of hardy growth, suc-

ceeding in any common soil and situation, and flowering annually in great abundance from May till October, in different sorts, though the general flowering season for the principal part of them is June and July; but in a full collection of the different species the blow is continued in constant succession several months, even sometimes from May till nearly Christmas; producing their flowers universally on the same year's shoots, rising from those the year before, generally on long pedunculi, each terminated by one or more roses, which in their characteristic state consist each of five large petals and many stamina; but in the doubles the petals are very numerous; and in some sorts the flowers are succeeded by fruit ripening to a red color in autumn and winter, from the seed of which the plants may be raised: but the most certain and eligible mode of propagating most of the sorts is by suckers and layers; and by which methods they may be increased very expeditiously. The white and red roses are used in medicine. The former distilled with water yields a small portion of a butyraceous oil, whose flavor exactly resembles that of the roses themselves. This oil and the distilled water are very useful and agreeable cordials. These roses also, besides the cordial and aromatic virtues which reside in the volatile parts, have a mild purgative one, which remains entire in the decoction left after distillation. The red rose, on the contrary, has an astringent and corroborating virtue.

ROSA, MOUNT, one of the Alpine heights, and next to Mont Blanc, the highest mountain in Europe. It stands between the canton of the Valais and Piedmont, to the east of Mont Cervin, Switzerland. Saussure calculated it to be 15,600 feet above the sea, or only seventy feet lower than Mont Blanc; Sir George Shuckburgh calls it 15,240 feet above the Mediterranean. It consists of a number of lofty peaks, all rising from a centre somewhat like the leaves of a rose.

ROSALBA (Cariera), a Venetian lady, born in 1675, who became an eminent paintress. She painted portraits in crayons and miniatures, and was greatly employed by the English nobility. She died in 1755, aged eighty.

ROSAMOND, the daughter of Walter lord Clifford, and concubine of Henry II., was a lady of exquisite beauty, educated in the nunnery of Godstow. The popular story of her is as follows:—Henry II. loved her, and triumphed over her honor. To avoid the jealousy of his queen Eleanor he kept her in a labyrinth at Woodstock, and by his connexion with her had William Longsword earl of Salisbury, and Geoffrey bishop of Lincoln. On Henry's absence in France, however, the queen discovered and poisoned her. The queen, it is said, discovered her apartment by a thread of silk. Some assert that she died a natural death; and the story of her being poisoned is by them said to have arisen from the figure of a cup on her tomb. She was buried in the church of Godstow, opposite to the high altar, where her body remained till it was ordered to be removed with every mark of indignity by Hugh bishop of Lincoln in 1191. She was, however, by many considered as a saint after her death, and fabulous legends were invented about her.

ROSARY, *n. s.* Lat. *rosarium*. A bunch of beads, on which the Romanists number their prayers.

No *rosary* this votress needs,
Her very syllables are beads. *Cleaveland*.
Every day propound to yourself a *rosary* or a chaplet of good works, to present to God at night. *Taylor*.

ROS'CID, *adj.* Lat. *roscidus*. Dewy; abounding with dew; consisting of dew.

Wine is to be forborn in consumptions, for the spirits of wine prey upon the *roscid* juice of the body. *Bacon*.

The ends of rainbows fall more upon one kind of earth than upon another; for that earth is most *roscid*. *Id.*

ROSCIUS (Quintus), an eminent Roman actor, so highly celebrated in comedy that his name is applied as the best encomium to all modern comedians of great merit. He was intimate with Cicero and Æsop the comedian; and was so much admired by the Romans that they gave him a pension for life. His eyes being distorted he wore a mask at first on the stage; but the Romans caused him to lay it aside, that they might enjoy his oratory more fully. Being calumniated by his enemies, Cicero, who had been his pupil, defended him in an elegant oration, which is still extant. Roscius wrote a treatise, in which he compared, with great talent, the profession of the orator with that of the comedian; of both which he was a competent judge. He died about A. A. C. 60.

ROSCOMMON (Wentworth Dillon), earl of, a celebrated poet of the seventeenth century, born in Ireland, under the administration of the first earl of Strafford, who was his uncle, and from whom he received the name of Wentworth at his baptism. He passed his infancy in Ireland; after which the earl of Strafford sent for him into England, and placed him at his own seat in Yorkshire, under the tuition of Dr. Hall, afterwards bishop of Norwich, who instructed him in Latin. On the earl of Strafford's impeachment he went to complete his education at Caen in Normandy; and after some years travelled to Rome. He returned to England soon after the Restoration, and was made captain of the band of pensioners; but a dispute with the lord privy-seal obliged him to resign his post, and revisit Ireland, where the duke of Ormond appointed him captain of the guards. Being attacked one night when coming out of a gaming house by three ruffians, he had despatched one of them, when a disbanded officer coming past generously took his part and disarmed the other, on which the third fled. The earl next day rewarded his brave assistant by resigning to him his post of captain of the guards. He returned to London, was made master of the horse to the dutchess of York, and married the lady Frances, eldest daughter of Richard earl of Burlington. He here distinguished himself by his writings. In 1683 he was seized with the gout; and, being too impatient of pain, he permitted a French empiric to apply a repelling medicine to give him relief; which drove the distemper into his bowels, and put a period to his life in January 1684. He was buried with great pomp in West-

minster-abbey. His poems, which are not numerous, are in the body of English poetry collected by Dr. Johnson. His Essay on Translated Verse, and his translation of Horace's Art of Poetry, have great merit.

ROSCOMMON, a county of Ireland, in the province of Connaught, bounded on the east by the counties of Leitrim, Longford, and Meath; on the north by Sligo and Leitrim; on the south by Galway; and on the west by part of Galway and Mayo, being about forty-seven miles in length, and nine to twenty-nine in breadth. It is very fruitful, and in general level, having but few hills. It yields excellent corn, as well as pasture; but there are some extensive bogs. The chief town is Athlone, but the assizes are held at Roscommon the shire town, situated sixty-nine miles W. N. W. of Dublin.

ROSE, *n. s.* } Fr. Dan. Swed. and
ROSEATE, *adj.* } Teut. *rose*; Lat. Ital. and
ROSED', } Span. *rosa*. A flower. For
ROSEMARY, *n. s.* } the phrase 'to speak under
ROSENOBLE, } the rose,' see the extract
ROSEWATER, } from Browne: roseate and
ROSET, } rosed mean rosy; red;
ROSIER, } blooming: rosemary (Lat.
RO'SY, *adj.* } *ros marina*), a weed; a
herb: rosenoble, an ancient English gold
coin stamped with a rose: rose-water, water
distilled from the rose: roset, a red color: rosier
(Fr. *rosier*), a rose-bush: rosy, resembling the
bloom, color, or fragrance of the rose.

Her yellow golden hair
Was trimly woven, and in tresses wrought,
Ne other tire she on her head did wear,
But crowned with a garland of sweet *rosier*. *Spenser*.
When the *rosy* fingered morning fair,
Weary of aged Tithon's saffron bed,
Had spread her purple robe through dewy air. *Id.*
Patience, thou young and rose-lipped cherubin. *Shakspeare*.

Can you blame her, being a man yet *rosed* over
with the virgin crimson of modesty, if she deny the
appearance of a naked blind boy? *Id.*
Bedlam beggars, with roaring voices,
Strike in their numb'd and mortified bare arms
Pins, wooden pricks, nails, sprigs of *rosemary*;
And with this horrible object, from low farms,
Inforce their charity. *Id.* *King Lear*.

Attend him with a silver bason
Full of *rosewater*. *Shakspeare*.
The succeeding kings coined *rose-nobles* and double
rose-nobles, the great sovereigns with the same in-
scription, Jesus autem transiens per medium eorum
ibat. *Cumden's Remains*.

Grind ceruss with a weak water of gum-lake,
roses, and vermillion, which maketh it a fair carna-
tion. *Peacham*.
Here without thorn the *rose*. *Milton*.

A smile that glowed
Celestial *rosy* red, love's proper hue. *Id.*
Fairest blossom! do not slight
That age, which you may know so soon;
The *rosy* morn resigns her light,
And milder glory to the noon. *Waller*.
This way of procuring autumnal *roses* will in most
rose bushes fail; in some good bearers it will suc-
ceed. *Boyle*.

Here pride has struck her lofty sail
That roamed the world around;
Here *roseate* beauty cold and pale
Has left the power to wound. *Id.*

By desiring a secrecy to words *spoke under the rose*,
we mean, in society and computation, from the an-
cient custom in symposiack meetings, to wear chap-
lets of *roses* about their heads. *Browne*.

Around their cell
Set rows of *rosemary* with flowering stem. *Dryden*.

As Thessalian steeds the race adorn,
So *rosy* coloured Helen is the pride
Of Lacedemon, and of Greece beside. *Id.*

Rosemary is small, but a very odoriferous shrub;
the principal use of it is to perfume chambers, and
in decoctions for washing. *Mortimer's Husbandry*.

While blooming youth and gay delight
Sit on thy *rosy* cheeks contest,
Thou hast, my dear, undoubted right
To triumph o'er this destined breast. *Prior*.

The neighbours
Followed with wistful look the damsel bier,
Sprigged *rosemary* the lads and lasses bore. *Gay*.
His drink should be cooling; as fountain water
with *rosewater* and sugar of roses. *Wiseman*.

For her the unfaded *rose* of Eden blooms. *Pope*.
I come, ye ghosts! prepare your *roseate* bow'rs,
Celestial palms and ever blooming flow'rs. *Id.*

The flower of the *rose* is composed of several
leaves, which are placed circularly, and expand in a
beautiful order, whose leafy flower-cup afterwards
becomes a roundish or oblong fleshy fruit inclosing
several angular hairy seeds; to which may be added,
it is a weak pithy shrub, for the most part beset with
prickles, and hath pinnated leaves. *Miller*.

Sleep'st thou, or wak'st thou, fairest creature?

Rosy morn now lifts his eye,
Numbering ilka bud with Nature
Waters wi' the tears o' joy. *Burns*.

ROSES, ESSENTIAL OIL OF, OF OTTO OF ROSES,
an essential oil obtained from roses. It may be
made in the following manner:—A quantity of
fresh roses, for example forty pounds, are put in
a still with sixty pounds of water, the roses being
left as they are with their calyxes, but with the
stems cut close. The mass is then well mixed
together with the hands, and a gentle fire is made
under the still; when the water begins to grow
hot, and fumes to rise, the cap of the still is put
on, and the pipe fixed; the chinks are then well
luted with paste, and cold water put on the re-
frigeratory at top: the receiver is also adapted at
the end of the pipe; and the fire is continued
under the still, neither too violent nor too weak.
When the impregnated water begins to come
over, and the still is very hot, the fire is lessened
by gentle degrees, and the distillation continued
till thirty pounds of water are come over, which
is generally done in about four or five hours;
this rose-water is to be poured again on a fresh
quantity (forty pounds) of roses, and from fifteen
to twenty pounds of water are to be drawn by
distillation, following the same process as before.
The rose-water thus made and cohobated will be
found, if the roses were good and fresh, and the
distillation carefully performed, highly scented

with the roses. It is then poured into pans either of earthenware or of tinned metal, and left exposed to the fresh air for the night. The otto or essence will be found in the morning congealed, and swimming on the top of the water; this is to be carefully separated and collected either with a thin shell or a skimmer, and poured into a vial. When a certain quantity has thus been obtained the water and faeces must be separated from the clear essence, which, with respect to the first, will not be difficult to do, as the essence congeals with a slight cold, and the water may then be made to run off. If, after that, the essence is kept fluid by heat, the faeces will subside, and may be separated; but if the operation has been neatly performed these will be few. The remaining water should be used for fresh distillations instead of common water, at least as far as it will go.

The following is the method commonly pursued in India, whence great quantities have been exported:—Take a very large glazed earthen or stone jar, or a large clean wooden cask; fill it with the leaves of the flowers of roses, very well picked, and freed from all seeds and stalks; pour on them as much pure spring water as will cover them, and set the vessel in the sun in the morning at sun-rise, and let it stand till the evening; then take it into the house for the night; expose it, in this manner, for six or seven successive days, and at the end of the third or fourth day a number of particles, of a fine yellow oily matter, will float on the surface, which, in two or three days more, will gather into a seum, which is the otto of roses. This is taken up by some cotton, tied to the end of a piece of stick, and squeezed with the finger and thumb into a small phial, which is immediately well stopped; and this is repeated for some successive evenings, or while any of this fine essential oil rises to the surface of the water.' Dr. Donald Monro, who communicated this receipt to the Royal Society of Edinburgh, says, that he has been informed, that some few drops of this essential oil have more than once been collected by distillation in London, in the same manner as the essential oils of other plants.

The Rose-Noble was first struck in the reign of Edward III. It was formerly current at 6s. 8d., and so called because stamped with a rose. See COINS.

ROSEAU, or Charlotte Town, the capital of Dominica, in the West Indies, about seven leagues from Prince Rupert's Bay. It stands on a point of land on the south-west side of the island, which here forms Woodbridge's Bay on the north, and Charlotteville Bay to the south. Roseau contains more than 500 houses, besides negro cottages. It was once a much larger place. Long. 61° 27' W., lat. 15° 25' N.

ROSETTA, a town of Egypt, on that branch of the Nile called by the ancients the Bolbitine, and which forms now one of the two great channels by which it enters the sea. It is called the canal of Rosetta. This city appears to have been built by one of the caliphs. In the thirteenth century it was an inconsiderable place; but, as the canal of Alexandria became impassable, Rosetta rose into importance as a *depôt*, and now

forms the medium point of communication between that city and Cairo. The streets are narrow; and each story projects over that beneath till at the top the opposite houses nearly meet; but the houses are not, as in most other parts of Egypt, composed of mud, but of a dingy red brick, often plastered over and white-washed. Upon the whole, however, Rosetta has a neat compact appearance for an eastern town, and its environs are delightful, being completely embosomed in a grove of date, banana, and sycamore trees. The orange, pomegranate, and henne, here also blend their perfumes; and the palm towers over all, adding magnificence to luxuriance. The intervals are filled with esculent plants. Numerous birds inhabit these groves, particularly the turtle-dove, which is held sacred, and approaches the habitations of mankind without dread. The opposite side of the Nile exhibits the richest part of the Delta. The inhabitants of Rosetta and the neighbourhood are milder and more civilised than those of other parts of Egypt: they are chiefly employed in agriculture, and contain a smaller proportion of the Bedouin tribes. Though less turbulent, however, than the inhabitants of Alexandria or Cairo, yet, being less accustomed to Christians, they view them with more hatred. Rosetta manufactures red cotton yarn, flax, linen, and silk dyes, for the oriental dresses: and here is an extensive exportation of rice. The quay is large and well built; the merchants being chiefly Turks, and natives of Syria. Copts form a considerable proportion of the population. Long. 30° 28' 35" E., lat. 31° 24' 31" N.

ROSICRUCIANS, a name assumed by a sect of hermetical philosophers, who arose in Germany in the beginning of the fourteenth century. They bound themselves together by some solemn secret, which they all swore inviolably to preserve; and obliged themselves, at their admission into the order, to a strict observance of certain established rules. They pretended to a superior acquaintance with all sciences, and chiefly medicine. They pretended to be masters of many important secrets; and, among others, of the philosopher's stone; all which they affirmed to have received by tradition from the ancient Egyptians, Chaldeans, the Magi, and Gymnosophists. The denomination appears to be derived from chemistry. It is not compounded, says Mosheim, as many imagine, of the words *rosa* and *crux*, rose and cross, but of *ros*, dew, and *crux*. Of all natural bodies dew was deemed the most powerful solvent of gold; and the cross, in the chemical language, is equivalent to light, because the figure of a cross + exhibits at the same time three letters, of which the word LVX, or light, is compounded. Hence a rosiereucian philosopher is one who, by the assistance of the dew, seeks for light, or the philosopher's stone. See Gassend's *Examen Philosophiæ Fluddanæ*, sect. 15, tom. iii. p. 261; and Renaudot's *Conférences Publiques*, tom. iv. p. 87. At the head of these fanatics were Robert Fludd, an English physician, Jacob Behmen, a mystic writer, and Michael Mayer. The principles which serve as a kind of centre of union to the rosiereucian society are the following:—They all maintained that the dissolu-

tion of bodies by fire is the only way by which men arrive at the first principles of things. They all acknowledged a certain analogy and harmony between the powers of nature and the doctrines of religion, and believed that the deity governed the kingdom of grace by the same laws with which he ruled the kingdom of nature; and hence they used chemical denominations to express the truths of religion. They all held that there is a sort of divine energy or soul, diffused through the frame of the universe, which some call the *archeus*, others the universal spirit, &c. They all speak in the most superstitious manner of what they call the signatures of things, of the power of the stars over all corporeal beings, and their particular influence upon the human race, of the efficacy of magic, and the various ranks and orders of demons. These demons they divided into two orders, sylphs and gnomes; from which system Pope borrowed his beautiful machinery of the Rape of the Lock. In fine, the rosicrucians and all their fanatical followers agreed in throwing out the most crude incomprehensible notions and ideas, in the most obscure, quaint, and unusual expressions.—Mosh. Eccl. Hist.

ROS'IN, *n. s. & v. a.* } Properly resin. Fr.
Ros'IN, *adj.* } *resine*; Lat. *resina*.
Inspissated turpentine; a juice of the pine: the adjective corresponding.

The best soil is that upon a sandy gravel or *rosiny* sand. Temple.

The billows from the kindling prow retire,
Pitch, *rosin*, searwood on red wings aspire. Garth.

Bouzebeus who could sweetly sing,
Or with the *rosined* bow torment the string. Gay.

Tea contains little of a volatile spirit; its *rosin* or fixed oil, which is bitter and astringent, cannot be extracted but by rectified spirits. Arbutnot.

ROSINUS (John), a learned German antiquary, born at Eisenach, in Thuringia, about 1550. He was educated at the university of Jena; became rector of a school at Ratisbon, in 1579; and afterwards minister of a Lutheran church at Wickerstadt, in Weimar. In 1592 he was called to Naumburg cathedral, in Saxony, and died there of the plague in 1626. He published several works, the chief of which is his *Antiquitatum Romanarum, libri x.*; Basil, 1583; folio.

ROSMARINUS, rosemary, in botany, a genus of the monogynia order, and diandria class of plants; natural order forty-second, verticillatæ: cor. unequal, with its upper lip bipartite; the filaments are long, curved, and simple, each having a small dent. There are two species, viz.:—

1. *R. angustifolia*, the narrow-leaved rosemary; and,

2. *R. latifolia*, the broad-leaved rosemary. This last has larger flowers and a stronger scent than the other. There are two varieties; one of the first sort with striped leaves, called the silver rosemary; and the other with yellow, called the gold-striped rosemary. These plants grow naturally in the south of France, Spain, and Italy; where, upon dry rocky soils near the sea, they thrive prodigiously, and perfume the air in such a manner as to be smelt at a great distance from

the land. However, they are hardy enough to bear the cold of our ordinary winters, provided they be planted upon a poor, dry, gravelly soil, on which they will endure the cold much better than in a richer ground, where, growing more vigorously in summer, they are more apt to be injured by frost in winter; nor will they have such a strong aromatic scent on a dry and barren soil. They are propagated either by slips or cuttings. Rosemary has a fragrant smell, and a warm pungent bitterish taste, approaching to that of lavender; the leaves and tender tops are strongest; next to these the cup of the flower; the flowers themselves are considerably the weakest, but most pleasant. Aqueous liquors extract a great share of the virtues of rosemary leaves by infusion, and elevate them in distillation; along with the water arises a considerable quantity of essential oil, of an agreeable penetrating smell. Pure spirit extracts in great perfection the whole aromatic flavor of the rosemary, and elevates very little of it in distillation; hence the resinous mass left upon extracting the spirit proves an elegant aromatic, very rich in the peculiar qualities of the plant. The flowers of rosemary give over great part of their flavor in distillation with pure spirit; by watery liquors their fragrance is much injured; by beating destroyed.

ROSS, or ROSS-SHIRE, a county of Scotland, including Tayne and Cromarty, stretching eighty miles in length, and seventy-eight in breadth, bounded on the north and north-east by Strathnaver and Sutherland; on the east by Cromarty and the Murray Frith; on the south by Inverness; and on the west by the Atlantic Ocean. The county of Ross takes up the whole breadth of the island; and, being much indented with bays and inlets from both seas, appears of a very irregular form. These bays afford safe harbours for shipping, especially that of Cromarty. The valleys are fertilised by several rivers, among which are the Beaul, the Conon, the Ockel, the Charron, and the Braan; besides a number of fresh water lakes, which abound in this county. The valleys are generally covered with wood; and near Alfrag there are forests of fir, well stocked with game. Great numbers of black cattle, horses, sheep, and goats, are fed upon the mountains; and the sea, rivers, and lakes, abound with fish and fowl. The lakes on the west coast abound with herrings, particularly Loch Eu, about nine miles long and three broad; one part of this is formed by a bay or inlet of the sea; and the other is a lake of fresh water. Though the middle part of Ross, called Ardross, is mountainous and barren, the north-east part on the river Charron, and Frith of Tayne, are fruitful and abound with villages. Ardmeanach, part of the peninsula, betwixt the bays of Cromarty and Murray, is a barony, which of old bestowed a title on the king of Scotland's second son. The district of Glenelchaig, on the south-west, belonged to the earl of Seaforth, chief of the Mackenzies; but the last earl, having joined in the rebellion, was in 1719 defeated at Glenshiel in this quarter, with a small body of Spaniards. His auxiliaries were taken; he escaped to the continent; but his

estate and honors were forfeited. The king's troops dismantled the castle of Yion-donnen, situated on an island in a bay that fronts the Isle of Sky, where he had erected his magazine. Ross was chiefly peopled by the Mackenzies and Frasers, two warlike Highland clans. There are fisheries carried on along the coast; but their chief traffic is in sheep and black cattle. The county sends a member to the imperial parliament; and Tayne and Dingwall join with Dornock, Wick, and Kirkwall, in electing a representative for these boroughs.

Ross, an ancient and populous town of Herefordshire, 115 miles from London, with a good trade, on the river Wye. It was made a free borough by Henry III. It is famous for cyder. Its market and fairs are well stored with cattle and other provisions. At the west end of it there is a fine broad causeway, constructed by Mr. John Kyrle, the celebrated Man of Ross, who also raised the spire 100 feet, and enclosed a piece of ground with a stone wall, and sunk a reservoir in its centre, for the use of the inhabitants of the town. He died in 1714, aged ninety, with the blessing of all who knew him, both rich and poor.

Ross, New, a borough town of Ireland, in the county of Wexford, and province of Leinster, on the side of a hill sixty-seven miles from Dublin. It was formerly walled, and some of the gates still remain. It lies on the Barrow, which is here very deep, and ships of burden can come up to the quay. The church is large, but the custom-house and quay are both small. It is one of the staple ports for exporting wool; beef and butter are the principal articles exported. It has a barrack for a troop of horse, and a ferry into the county of Kilkenny. Near this town is a charter-school. It was formerly fortified, and adorned with many religious houses, among which was a crowded friary, built on the summit of a hill in the town; but, one of the friars having killed a principal inhabitant, the people rose, put the friars to death and destroyed the friary; on the site of which the monastery of St. Saviour, for conventual Franciscans, was afterwards erected by Sir John Devereux; and the east end of this last building is now the parish church. A friary for Eremites, following the rule of St. Augustine, was also founded here in the reign of Edward III. This town was the scene of a very bloody battle, between the Irish rebels and the king's troops, on the 5th of June, 1798. Each party was alternately in possession of the town, and the greater part of it was burnt down during the contest. About 3000 of the rebels were killed, but each party boasted of victory. New Ross lies eleven miles north of east of Waterford, and nineteen south of Wexford.

Ross (Alexander), a very voluminous writer, who has been often confounded with the bishop of Edinburgh. His best work is his *Πανσιβεια*, or, A View of all Religions. Butler, in his *Hudibras*, refers to the number and extent of his writings,

There was an ancient sage philosopher,
Who had read Alexander Ross over.

Ross (David), a celebrated English actor, born in 1728, he was disinherited by his father for going upon the stage. He had been educated at Westminster school; and made his first appearance upon Covent Garden Theatre in 1753, where he continued till 1778, when he was left out of the engagement by the managers, and reduced to great distress; though he still had a small annuity from a mortgage on the Edinburgh Theatre, of which he was previously patentee. But one day he was agreeably surprised by receiving a bank note for £60, with an anonymous line, mentioning that it came from an old school-fellow, and directing him to a banker from whom he would receive the same sum annually. This was continued for life, but the generous donor was still unknown, till the banker's clerk inadvertently blundered out the name of admiral Barrington. In 1788 he was laid aside from the stage by breaking his leg. He had married the celebrated Fanny Murray. He died at London, September 14th, 1790.

ROSSO, or MAIKE ROUX, an eminent Italian painter, born at Florence in 1496. He was entirely self taught, and acquired great skill, both in history and portrait painting. In the church of St. Salvatore, at Rome, is a fine picture by him of the beheading of John the Baptist. He died in 1541, aged forty-five.

ROSSANO, a town of Naples, in Calabria Citra, situated on a rocky eminence. It is the see of an archbishop, and the environs are fertile in olives, capers, and saffron. It is said that, so lately as the sixteenth century, the inhabitants of this town (about 70,000) spoke the Greek language, and followed the rites of the Greek church. Thirty miles north-east of Cosenza, and 110 N. N. E. of Reggio.

ROS SOLIS, a spirituous liquor, composed of burnt brandy, sugar, cinnamon, and milk; and sometimes perfumed with a little musk. It had its name from being at first prepared from the juice of the plant *ros solis*, or *drosera*.

ROSTOV, a town of European Russia, in the government of Jaroslav, on the lake Nero. It is divided into the town and suburb, and is above five miles in circumference. It contains an ancient cathedral, an archiepiscopal palace, a seminary, and five churches; and carries on an intercourse with Astracan, Moscow, and St. Petersburg. Of the lower classes a number are gardeners, and some of them go to Poland for employment. Inhabitants 5000. Forty miles S. S. W. of Jaroslav.

Rostov, a fortified town of the south-east of European Russia, on the Don, between Azov and Tscherkask.

ROSTRATED, *adj.* Lat. *rostratus*. Adorned with beaks of ships.

He brought to Italy an hundred and ten rostrated galleys of the fleet of Mithridates. *Arbuthnot.*

ROSTRUM, *n. s.* Lat. *rostrum*. The scaffold whence orators anciently harangued.

Vespasian erected a column in Rome, upon whose top was the prow of a ship, in Latin *rostrum*, which gave name to the common pleading place in Rome, where orations were made, being built of the prows of those ships of Antium which the Romans overthrew. *Peacham on Drawing.*

Myself shall mount the *rostrum* in his favour,
And strive to gain his pardon from the people.

Addison.

ROSTRUM, the beak, an important part of the ancient ships of war, called by the Greeks *ἄβολον*, made of wood, fortified with brass, and fastened to the prow so as to strike the enemy's vessels and sink them. The first rostra were long and high, but afterwards they were made short and strong by the contrivance of Aristo, a Corinthian: and placed so low that they could pierce the enemy's ships under water. Also a part of the Roman forum, wherein orations, pleadings, funeral harangues, &c., were delivered. The rostrum was a kind of chapel, furnished with a suggestum, or eminence, where the orator stood to speak. It was so called because at first adorned with the rostra or beaks of the ships taken from the Antiaë in the first naval victory obtained by the Romans.

ROT, *v. n., v. a., & n. s.* } Saxon, *rotan* ;
ROTEN, *adj.* } Belg. and Swed.

ROTENNESS, *n. s.* } *rotten*. To putrefy ;
lose the cohesion of parts : make putrid : putridity ; a disease among sheep : rotten and rottenness corresponding in sense.

Who brass as *rotten* wood ; and steel no more
Regards than weeds. *Sandys's Paraphrase.*

They were left moiled with dirt and mire, by reason of the deepness of the *rotten* way.

Knolles's History of the Turks.

A man may *rot* even here. *Shakspeare.*

From hour to hour we ripe and ripe, *Id.*

And then from hour to hour we *rot* and *rot*. *Id.*

Trust not to *rotten* planks. *Id.*

O bliss-breeding sun, drawn from the earth

Rotten humidity ; below thy sister's orb

Infect the air. *Id. Timon.*

Diseased ventures,

That play with all infirmities for gold,

Which *rottenness* lends nature ! *Shakspeare.*

No wood shone that was cut down alive, but such
as was *rotted* in stock and root while it grew.

Bacon.

There is by invitation or excitation ; as when a
rotten apple lieth close to another apple that is
sound ; or when dung, which is already putrefied, is
added to other bodies. *Id.*

In an unlucky grange, the sheep died of the *rot*,
the swine of the mauge, and not a goose or duckling
throve. *Ben Jonson.*

They overwhelm their panch daily with a kind of
fat *rotgut*, we with a bitter dreggish small liquor.

Harvey.

The cattle must of *rot* and murrain die. *Milton.*

The wool of Ireland suffers under no defect, the
country being generally full-stocked with sheep, and
the soil little subject to other *rots* than of hunger.

Temple.

Frowning Auster seeks the southern sphere,
And *rots*, with endless rain, the' unwholesome year.

Dryden.

They serewood from the *rotten* hedges took,
And seeds of latent fire from flints provoke. *Id.*

Brandy scarce prevents the sudden *rot*
Of freezing nose and quick decaying feet. *Philips.*

Being more nearly exposed to the air and weather,
the bodies of the animals would suddenly corrupt and
rot ; the bones would likewise all *rot* in time, except
those which were secured by the extraordinary
strength of their parts. *Woodward.*

If the matter stink and be oily, it is a certain sign
of *rottenness*. *Wiseman's Surgery.*

ROT, a well known disease in the liver of sheep,
and other domestic animals, producing general
marasmus, and generally evinced by the existence
of large quantities of the liver fluke, or fasciola
hepatica, in this organ. It has been ascribed to
a variety of causes : yet the real cause is still
doubtful. See **SHEEP**.

ROTA, a town in Andalusia, Spain, situated
on the north side of Cadiz Bay. It has a
castle and monastery, but is most remarkable for
the wine which is produced on the hills around.
It is called in England *tent*, and is considered
one of the best kinds produced in the peninsula.
Inhabitants 6000. Seven miles N. N. W. of
Cadiz.

ROTA ARISTOTELICA, or Aristotle's Wheel,
a name given to a celebrated problem in me-
chanics concerning the motion or rotation of a
wheel about its axis ; so called because first
noticed by Aristotle. The difficulty is this :
while a circle makes a revolution on its centre,
advancing at the same time in a right line along
a plane, it describes, on that plane, a right line
which is equal to its circumference. Now, if
this circle, which may be called the deferent,
carry with it another smaller circle, concentric
with it, like the nave of a coach wheel ; then this
little circle, or nave, will describe a line in the
time of the revolution which shall be equal to
that of the large wheel or circumference itself ;
because its centre advances in a right line as fast
as that of the wheel does, being in reality the
same with it. The solution given by Aristotle
is no more than a good explication of the diffi-
culty. The great Galileo next attempted it, but
failed, as did also Tacquet, with no better suc-
cess. After the fruitless attempts of so many
great men, M. Dortous de Meyran, a French
gentleman, sent a solution to the Academy of
Sciences ; which being examined by Messrs de
Louville and Soulmon appointed for that pur-
pose, they made their report that it was satisfac-
tory. The solution, is to this effect : the wheel
of a coach is only acted on, or drawn in a right
line ; its rotation or circular motion arises purely
from the resistance of the ground upon which it
is applied. Now this resistance is equal to the
force which draws the wheel in the right line,
inasmuch as it defeats that direction ; of conse-
quence the causes of the two motions, the one
right and the other circular, are equal. And
hence the wheel describes a right line on the
ground equal to its circumference. As for the
nave of the wheel, the case is otherwise. It is
drawn in a right line by the same force as the
wheel ; but it only turns round because the
wheel does so, and can only turn in the same
time with it. Hence it follows, that its circular
velocity is less than that of the wheel, in the
ratio of the two circumferences ; and, therefore,
its circular motion is less than the rectilinear one.
Since then it necessarily describes a right line
equal to that of the wheel, it can only do it partly
by sliding, and partly by revolving, the sliding
part being more or less as the nave itself is
smaller or larger.

ROTALA, in botany ; a genus of the mono-
gynia order and triandria class of plants : *cal.*
tridentate : *cor.* *nunc* : *caps.* *trilocular* and *poly-*

spermous. Species one only; an annual of the East Indies.

ROTARI (Peter), an eminent Italian painter of history and portraits, born at Verona about 1727. In 1756 he went to Petersburg, where he painted the empress Catharine II. and others of the imperial family.

ROTARY, *adj.* } Lat. *rota*. Whirling as
ROTATION, *n. s.* } a wheel: the act or state
ROTATOR. } of whirling: that which
gives a circular motion.

Of this kind is some disposition of bodies to *rotation* from east to west; as the main float and re-float of the sea, by consent of the universe as part of the diurnal motion. *Bacon.*

By a kind of circulation or *rotation*, arts have their successive invention, perfection, and traduction from one people to another. *Hale.*

The axle-trees of chariots take fire by the rapid *rotation* of the wheels. *Newton's Optics.*

This articulation is strengthened by strong muscles; on the inside by the triceps and the four little rotators. *Wiseman.*

In fond *rotation* spread the spotted wing,
And shiver every feather with desire. *Thomson.*

ROTATION is a term which expresses the motion of the different parts of a solid body round an axis, and distinct from the progressive motion which it may have in its revolution round a distant point. The earth has a rotation round its axis, which produces the vicissitudes of day and night; while its revolution round the sun, combined with the obliquity of the equator, produces the varieties of summer and winter. The mechanism of this kind of motion, or the relation which subsists between the intensity of the moving forces, modified as it may be by the manner of application and the velocity of rotation, is highly interesting, both to the speculative philosopher and to the practical engineer. The precession of the equinoxes, and many other astronomical problems of great importance and difficulty, receive their solutions from this quarter: and the actual performance of our most valuable machines cannot be ascertained by the mere principles of equilibrium, but require a previous acquaintance with certain general propositions of rotatory motion. When a solid body turns round an axis, retaining its shape and dimensions, every particle is actually describing a circle round this axis, and the axis passes through the centre of the circle, and is perpendicular to its plane. In any instant of the motion, the particle is moving at right angles with the radius vector, or line joining it with its centre of rotation. This subject is by no means a speculation of mere curiosity, interesting to none but mathematicians: one of the noblest arts practised by man is capable of receiving very great improvement from a complete knowledge of it; we mean the art of Seamanship. The consideration of it, therefore, might be pursued to a considerable extent—but few professional seamen have the preparatory knowledge necessary for the purpose.

ROTE, *n. s.* Sax. *not*, merry; old Fr. *rote*. A harp; a lyre. Obsolete: Fr. *routine* seems to be the origin of rote, mere memory.

Wele couth he sing, and playen on a rote.

Chaucer.

Worthy of great Phœbus' rote,
The triumphs of Phlegrean Jove he wrote,
That all the gods admired his lofty note. *Spenser.*

First rehearse this song by rote,
To each word a warbling note. *Shakspeare.*

Speak to the people
Words *roted* in your tongue; bastards and syllables
Of no allowance to your bosom's truth. *Id.*

He rather saith it by rote to himself, than that he can thoroughly believe it. *Bacon's Essays.*

All this he understood by rote,
And as occasion served would quote. *Hudibras.*

Learn Aristotle's rules by rote,
And at all hazards boldly quote. *Swift.*

ROTHENBURG on the TAUBER, an old town of Bavarian Franconia, on a mountain near the Tauber. It has a high school and a public library, said to contain valuable manuscripts. It contains, also, a square and several public buildings: the water in the fountains is raised by machinery from the river. Population 5700. Twenty-eight miles S. S. E. of Wurzburg.

ROTHERAM, or ROTHERHAM, a market-town and parish of the West Riding of York, situated near the conflux of the Rother and Don, six miles north-east of Sheffield and 158 from London. The principal manufactures are those of iron and steel, and there is a very extensive brewery. At the village of Masborough, separated from this town by a bridge, there are very extensive manufactories of all kinds of cast and wrought iron, and also of tinned plates and steel goods. The coal and iron are chiefly supplied from mines in the neighbourhood. The trade of Rotherham is materially assisted by the navigation of the Don. The streets are narrow and irregular and the church is a large building in the form of a cross. It had formerly an ancient chapel on the bridge over the Don. In the town are also two chapels for dissenters, a charity-school, and the Rotherham Independent Academy, for the education of young men proposing to become independent clergymen. Rotherham market is one of the most considerable in Yorkshire for fat cattle and sheep. Here is a commercial bank. Market on Monday.

ROTHERAM, or ROTHERHAM (John), M. D., a celebrated English physician, the son of a dissenting clergyman, tutor of an academy at Kendal, where he was born in 1719. Under his father's instructions he acquired classical learning, and a very general knowledge of the sciences. In 1740 he was sent to the University of Edinburgh, where professor M'Laurin, observing his talents, advised him to give a course of lectures on experimental philosophy. These lectures were well attended; and the profits were devoted to the Royal Infirmary, then building in that city. After this he went to London, studied under Dr. Smellie; and then began practice at Hexham; but soon after settled at Newcastle, where he was highly respected. In 1770 he published a work, entitled *A Philosophical Enquiry into the Nature and Properties of Water*, wherein he gave an analysis of the Newcastle and many other waters. He married Catharine, daughter of Nicholas Roberts, Esq., of Hexham, whom he left a widow with seven children, dying on the 18th of March, 1787, aged sixty-eight.

ROTHESAY, or **ROTHSAY**, a royal borough of Scotland, capital of the island and county of Bute. It is well built, and excellently situated for commerce, having a good harbour with a safe anchorage at the bottom of an extensive bay, on the north-west side of the island; opposite to Loch Steven in Cowal. It was erected into a royal borough in 1400, by king Robert III., when its castle was the royal residence. It was then a considerable town, but afterwards declined greatly; so that in 1762 many of the houses were in ruins, and it had only one decked vessel, of no great burden. But under the auspices of the earls of Bute it has rapidly improved. A large cotton mill was erected in 1778. This borough unites with Ayr, Irvine, Inverary, and Campbelton, in electing a representative in the imperial parliament. Duke of Rothesay was anciently a title of the prince of Scotland, and was accompanied with suitable revenues, powers, and privileges; and is still one of the titles of the prince of Wales. The only relic of antiquity in this borough is the castle, the remains of which are so completely covered with ivy that its walls are hardly visible. The natives still point out the banqueting rooms and bed-chambers of king Robert II. and III. who inhabited it. It afterwards became the chief residence of the Stuarts till 1685, when it was burnt by the duke of Argyle. It lies seventy miles west of Edinburgh.

ROTHMAN (Christopher), a learned German astronomer of the sixteenth century. He became astronomer to the landgrave of Hesse. He wrote *A Treatise on Comets*; and *Letters on Astronomy* to Tycho Brahe. He died in 1592.

ROTSCHEN-SALM, a sea-port of the Gulf of Finland, at the mouth of the Kymmene, eleven miles W. S. W. of Fredericksham. It has a harbour capable of containing the whole fleet of Russian galleys, and forty ships of the line, and is defended by two forts.

ROTTENSTONE, a mineral found in Derbyshire and used by mechanics for all sorts of finer grinding and polishing, and sometimes for cutting of stones. It is a species of tripoli.

ROTTERDAM, an important commercial city of Holland, on the Maese, which here resembles an arm of the sea. Its plan is triangular, the longest side (above a mile and a half in extent), stretching along the bank of the Maese, at about twenty miles from its mouth. The town is surrounded by a moat, and entered by six gates towards the land, and four towards the water, but has no fortifications. It is also traversed from north to west by the Rotte, a river, or broad canal, which here joins the Maese, and which seems to give name to the city. It is further intersected more than most other towns in Holland, by canals, which divide the half of the town near the river into several insulated spots connected by bridges. Thus, the first stately row of houses facing the Maese, and called the Boomtjes, has behind it a broad and deep canal, parallel to the river. This section is succeeded by a triangular, and next by an oblong division, each containing several streets and quays. Large vessels unload in two great inlets from the Maese, one stretching to the west, and

the other to the north. South-east of the town are two canals, with a basin and dock for the repair of shipping.

The canals are almost all bordered with trees. Next to the Boomtjes comes the Haring-vliet. The other streets are in general long and narrow, and several of them so similar that a stranger has much difficulty in distinguishing them. The houses are convenient, and the peculiar style of Dutch architecture is here usually prevalent. In many the ground floor is not inhabited, but serves with its gate and arched passage as an entrance to the warehouses. The principal public buildings are the exchange (finished in 1736), the church of St. Lawrence, from the top of which may be seen the Hague to the north-west, Leyden to the north, and Dort to the south-east; the old town-house, the admiralty, the academy, the theatre, and the extensive buildings of the East India Company. Rotterdam contains also several commodious market-places, an English Episcopal and a Scotch Presbyterian church. Of scientific collections, it has a cabinet of antiquities, a cabinet of natural history, and a public library. It has also an academy of sciences, instituted in 1771. Rotterdam, as a commercial city, has superior accommodation to Amsterdam, the Maese being open, and the passage free from ice, earlier than in the Zuyder Zee, and a single tide sufficing to carry vessels to the German Ocean. It became a privileged town, and was surrounded with walls, as early as the thirteenth century, owing, like other towns in Holland and Flanders, its increase to the facility of communicating by water not only with the sea, but with the interior. The time of its greatest prosperity was the seventeenth and eighteenth centuries; but after 1795 the invasion of the French, and the war with England suspended the commerce of Holland. It had begun to recover in 1802, when it was again rapidly depressed by the renewal of war; but has recently revived once more. The following is a list of the ports from which most of the vessels arrived in 1817:—

Riga	272	Dantzic	31
London	253	Hull	28
Harwich	110	Kiel	22
Petersburgh	90	Archangel	20
Libau	73	Lisbon	16
Newcastle	62	Bordeaux	15
Bergen	45	Hamburgh	10

Here, as at Amsterdam, the far greater proportion of tonnage is employed in transporting the commodities of the Baltic, viz. corn, timber, flax, and hemp. In value, however, the merchandise from England, consisting of hardware, cottons, woollens, and other manufactures, exceeds the imports of any other country. From France the chief imports are wine and brandy; and the trade with Brasil, as well as with Spanish America, is becoming more and more considerable. Population about 56,000. Fourteen miles south-east of the Hague, and thirty-six south by west of Amsterdam.

ROTUND, *adj.* } Fr. *rotonde*; Lat. *rotundus*.
ROTUN'DITY, *n. s.* } *du*s. Round; circular; spherical: the noun substantive corresponding.

Thou, all-shaking thunder,
Strike flat the thick *rotundity* o' the ' world.

Shakspeare.

With the *rotundity* common to the atoms of all fluids there is some difference in bulk, else all fluids would be alike in weight.

Grew.

Who would part with these solid blessings for the little fantastical pleasantness of a smooth convexity and *rotundity* of a globe ?

Beutley's Sermons.

The cross figure of the Christian temples is more proper for spacious buildings than the *rotund* of the hearthen : the eye is much better filled at first entering the *rotund*, but such as are built in the form of a cross give us a greater variety.

Addison.

Rotundity is an emblem of eternity, that has neither beginning nor end.

Id. on Medals.

ROVE, *v. n.* & *v. a.* } Danish *rofficer*, to
RO'VER, *n. s.* } range for plunder. To

ramble ; range ; wander : wander over : a rover is, a wanderer ; a robber ; pirate : at rover is an obsolete phrase for at random, without particular aim.

Thou'st years upon thee, and thou art too full

Of the wars surfeits, to go *rove* with one

That's yet unbruised. *Shakspeare. Coriolanus.*

This is the case of *rovers* by land, as some cantons in Arabia.

Bacon's Holy War.

Roving the field, I chanced

A goodly tree far distant to behold,

Loaden with fruit of fairest colors.

Milton.

Nature shoots not at *rovers* ; even inanimates, though they know not their perfection, yet are they not carried on by a blind unguided impetus ; but that which directs them knows it. *Glanville's Scepis.*

Providence never shoots at *rovers* : there is an arrow that flies by night as well as by day, and God is the person that shoots it.

South's Sermons.

Men of great reading shew their talents on the meanest subjects ; this is a kind of shooting at *rovers*.

Addison.

Cloacina, as the town she *roved*

A mortal scavenger she saw, she loved.

Gay.

Faultless thou dropt from his unerring skill,

With the bare power to sin, since free of will ;

Yet charge not with thy guilt his bounteous love,

For who has power to walk has power to *rove*.

Arbuthnot.

I viewed the' effects of that disastrous flame,

Which, kindled by the' imperious queen of love,

Constrained me from my native realms to *rove*.

Pope.

If we indulge the frequent rise and *roving* of passions, we thereby procure an unattentive habit.

Watts.

ROUBILLIAC (Louis Francis), an eminent modern sculptor, a native of France, who settled in England in the reign of George I. ; and long stood at the head of his profession. He executed a statue of Handel for Vauxhall, and another of Sir Isaac Newton for Trinity College, Cambridge ; but was chiefly employed on sepulchral monuments, among which may be mentioned that of John duke of Argyle in Westminster-abbey ; of George I., and of the duke of Somerset, in the senate-house at Cambridge ; and his monuments for the duke and duchess of Montagu, at Warkton, in Northamptonshire. Lord Chesterfield said, ' Roubilliac was our only statuary, and that other artists were mere stone-cutters.' He had some talent for poetry, and wrote some tolerable French satires. His death took place January 11, 1762, at his residence in St. Martin's Lane.

ROUEN, a large and populous city in the north of France, once the capital of Normandy, at present of the department of the Lower Seine (see NORMANDY), is situated on the right bank of the Seine, in a fertile and pleasant country. Its form is an irregular oval, two miles in length and in one breadth. The streets, though in general straight, are very narrow, so that there is no room for foot pavement ; and, as the French have not yet adopted the plan of underground sewers, the eye is constantly offended with a stream of filth running along the middle of the street. A number of houses are of wood, built in an antiquated style, the walls often projecting as they ascend. The most agreeable part of the town is that which adjoins the Seine, the quays being spacious, and bordered with good houses, while the river and its islands, with the beautiful ' Cours,' a walk extending along the opposite bank, the esplanade, and the neighbouring hill of St. Catherine, about 400 feet high, form an assemblage of pleasant objects. The squares are small and insignificant ; the one called the Marche aux Veaux contains the statue of the warlike maid of Orleans, who was burned here by the English, as a sorceress, in 1430. The ramparts, being levelled and lined with trees, contain pleasant walks ; and the public roads leading to Paris, Havre, and other places, are bordered with trees. The objects of antiquarian research in this city have engaged our attention in the article already referred to. The town-house, or municipality, is the chief civil edifice worth notice ; and the barracks are large and commodious. The great hospital is a handsome modern building ; and in public markets Rouen is not inferior to any city of France. Of the curiosities of the place, the most interesting, perhaps, is the bridge of boats over the Seine. Rouen is celebrated for its cotton manufactures, but here, as in other parts of France, the goods are less remarkable for taste in the pattern than durability. Rouen has likewise manufactures of woollens, linens, and, to a smaller extent, of paper, iron ware, hats, pottery, wax cloth ; also sugar refineries. Dyeing both of woollen and cotton is also conducted with care and success.

The whole of its manufacturing industry is computed to give employment to 50,000 persons, young and old. The great disadvantages of Rouen are the want of fuel, and the dearth of provisions : at the distance of 100 miles to the westward the family of a workman can be supported at a reduction of thirty per cent. But, during the exclusion of British commerce under Buonaparte, it flourished largely ; particularly considering its further disadvantage in point of navigation. It is forty-five miles east of Havre, and eighty W. N. W. of Paris.

ROVEREDO, a large and fine town of the Tyrol, Austria, on the left bank of the Adige, was once subject to Venice ; but since 1509 it has been under the protection of the empire, and enjoyed privileges which soon made it a staple for the silk manufacture. This branch of industry was at its height about the middle of the eighteenth century. The environs produce tobacco, which, as well as the leather of the town, forms an article of export. There are no

public edifices of consequence, but Roveredo is a well built town, and the marble found in the vicinity has been much used in the construction of the houses. Twenty-eight miles north of Verona, and twelve south by west of Trent.

ROUGE, *n. s.* Fr. *rouge*. Red paint.

ROUGH, <i>adj.</i>	} Saxon, þrupge; Swed. <i>rugg</i> ; Goth. <i>hrock</i> . Rugged; of unequal sur- face; coarse; hairy; hence harsh; severe; rude; terrible; stormy: roughcast is, a rude model,
ROUGH'CAST, <i>v. a. & n. s.</i>	
ROUGH'DRAFT, <i>n. s.</i>	
ROUGH'DRAW, <i>v. a.</i>	
ROUGH'EN, <i>v. a. & v. n.</i>	
ROUGH'HEW, <i>v. a.</i>	
ROUGH'HEWN, <i>part. adj.</i>	
ROUGH'LY, <i>adv.</i>	
ROUGH'NESS, <i>n. s.</i>	
ROUGH'WORK.	

or a kind of rough plaster mixed with pebbles: to roughcast is, to mould or form in a rough way: rough-draft, rough-draw, and roughwork, are of similar signification: to roughen is, to make or grow rough: the adverb and noun substantive corresponding.

Ne Mammon would there let him long remain,
For terror of the torments manifold,
In which the damned souls he did behold,
But roughly him bespake. *Spenser.*

A fiend, a fury, pitiless and rough,
A wolf: nay worse, a fellow all in buff. *Shakspeare.*

Come what come may,
Time and the hour run through the roughest day. *Id.*

Some man must present a wall; and let him have
some plaster, lome, or roughcast about him to signify
wall. *Id.*

There's a divinity that shapes our ends,
Roughhew them how we will. *Id. Hamlet.*

Rebuked, and roughly sent to prison,
The immediate heir of England! was this easy?
Shakspeare.

A roughhewn seaman, being brought before a justice
for some misdemeanour, was by him ordered
away to prison; and would not stir; saying, it was
better to stand where he was, than to go to a worse
place. *Bacon's Apophthegms.*

Roughness is a needless cause of discontent; severity
breedeth fear; but roughness breedeth hate;
even reproofs from authority ought to be grave and
not taunting. *Bacon.*

Nor bodily, nor ghostly negro could
Roughcast thy figure in a sadder mould. *Cleaveland.*

The whole piece seems rather a loose model and
roughcast of what I design to do, than a complete
work. *Digby.*

I hope to obtain a candid construction of this
roughhewn ill timbered discourse. *Hewel.*

Strait with a band of soldiers tall and rough
On him he seizes. *Cowley's Davideis.*

When our minds' eyes are disengaged,
Fley quicken sloth, perplexities untie,
Flake roughness smooth, and hardness mollify. *Denham.*

He gave not the king time to prosecute that
gracious method, but forced him to a quicker and
ougher remedy. *Clarendon.*

The fiend
O'er bog, or steep, through strait, rough, dense, or
rare,
Pursues his way. *Milton.*

Before the cloudy van,
In the rough edge of battle ere it joined,
Satan advanced. *Id.*

The whole world, without art and dress,
Would be but one great wilderness,
And mankind but a savage herd,
For all that nature has conferred.
This does but roughhew and design,
Leaves art to polish and refine. *Hudibras.*

Divers plants contain a grateful sharpness; as
lemons; or an austere and incocted roughness, as
sloes. *Browne.*

The little roughnesses or other inequalities of the
leather against the cavity of the cylinder, now and
then put a stop to the descent or ascent of the
sucker. *Boyle.*

A rosy chain of rheums, a visage rough,
Deformed, unfeatured, and a skin of buff. *Dryden.*

In merriment they were first practised, and this
roughcast unlearned poetry was instead of stage plays
for one hundred and twenty years. *Id.*

My elder brothers came
Roughdraughts of nature, ill designed and lame,
Blown off, like blossoms never made to bear;
Till I came finished, her last laboured care. *Id.*

His victories we scarce could keep in view,
Or polish them so fast as he roughdrew. *Id.*

Such difference there is in tongues, that the same
figure, which roughens one, gives majesty to another;
and that was it which Virgil studied in his verses. *Id.*

When the diamond is not only found, but the
roughness smoothed, cut into a form, and set in gold,
then we cannot but acknowledge that it is the perfect
work of art and nature. *Id.*

Kind words prevent a good deal of that perverseness
which rough and imperious usage often produces
in generous minds. *Locke.*

Thus you must continue, till you have rough-
wrought all your work from end to end. *Moxon's Mechanical Exercises.*

A tobacco-pipe broke in my mouth, and the spit-
ting out the pieces left such a delicious roughness on
my tongue, that I champed up the remaining part. *Spectator.*

Roughness of temper is apt to discountenance the
timorous or modest. *Addison.*

Were the mountains taken all away, the remaining
parts would be more unequal than the roughest sea;
whereas the face of the earth should resemble that of
the calmest sea, if still in the form of its first mass. *Burnet's Theory.*

The booby Phaon only was unkind,
A surly boatman rough as sea and wind. *Prior.*

Such a persuasion as this well fixed, will smooth
all the roughness of the way that leads to happiness,
and render all the conflicts with our lusts pleasing. *Atterbury.*

Hippocrates seldom mentions the doses of his me-
dicines, which is somewhat surprising, because his
purgatives are generally very rough and strong. *Arbuthnot on Coins.*

Most by the numbers judge a poet's song,
And smooth or rough with them is right or wrong. *Pope.*

Ah! where must needy poet seek for aid,
When dust and rain at once his coat invade?
His only coat; when dust confused with rain,
Roughens the nap, and leaves a mingled stain. *Swift.*

The Swedes, Danes, Germans, and Dutch attain
to the pronunciation of our words with ease because
our syllables resemble theirs in roughness and fre-
quency of consonants. *Id.*

The broken landskip,
Ascending, roughens into rigid hills. *Thomson.*

Then what was left of roughness in the grain
Of British natures, wanting its excuse

That it belongs to freemen, would disgust
And shock me.

Couper.

ROVIGNO, a maritime town of Austrian Illyria, on the coast of Istria. It is built on a rock, which forms two good harbours; but that nearest the town is not considered secure, and is resorted to chiefly by boats and barges. Rovigno is only a mile in circumference, but very populous, containing 10,000 inhabitants, whose chief employments are the pilchard fishery, ship-building, and the sale of wood. The environs produce olive oil and wine, and beautiful marble. Forty miles south of Trieste, and thirty-seven south-west of Fiume.

ROVIGO, a district of Austrian Italy, bounded by the delegations of Venice, Padua, Verona and Mantua, and separated by the Po from the States of the Church. Its superficial extent is about 550 square miles, traversed by a number of rivers; and in many places marshy and unhealthy. It is, however, fertile throughout, the marshes producing fine crops of rice; maize, flax, hemp, and silk, are the other objects of culture. The number of black cattle and horses reared is also large. This district was formerly called Polesino di Rovigo, from the number of canals by which it is intersected. In 1806 the title of duke of Rovigo was given by Buonaparte to Savary, his minister of police. Population 63,000.

Rovigo, the capital of the above district, is situated on the Adigetto, a branch of the Adige, and surrounded with a wall and moat: to the east is a fortified castle. The Palazzo del Podesta, the former residence of the chief magistrate, is situated in a large square, the principal ornament of which is a pillar of stone. The churches here are not worthy of notice. The town is the residence of the bishop of Adria. Population 9000. Eighteen miles N. N. E. of Ferrara, and thirty-five S. S. W. of Venice.

ROUILLE (Peter Julian), a learned French Jesuit, born at Tours, in 1681. He assisted father Catrou in writing the Roman History, in 21 vols. 4to., and died in Paris in 1740, aged forty-nine.

ROULERS, a considerable town of the Netherlands, in West Flanders, situated on the Mandel. It has a linen manufacture, the principal product of the surrounding district being flax. The adjacent pastures are rich, and the breed of cattle good: butter is a large article of export. There is here a central school, with eight teachers. Twelve miles N. N. E. of Ypres, and eighteen south of Bruges.

ROUNCEVAL, *n. s.* From Roncesval, a town at the foot of the Pyrenees. A species of pea.

Dig garden,

And set as a daintie thy *runcival* pease. *Tusser.*

ROUND, <i>adj., n. s., v. a., v. n.,</i>	} Fr. <i>ronde</i> ; Ital. <i>rondo</i> . Teut. Sw. and Dan. } <i>round</i> ; Sp. <i>redondo</i> . Circular; spherical; without
ROUND-ABOUT, <i>adj.</i> [<i>adv. & prep.</i>]	
ROUND'EL, <i>n. s.</i>	
ROUND'ER,	
ROUND-HEAD, <i>n. s.</i>	
ROUND-HOUSE,	
ROUND'ISH, <i>adj.</i>	
ROUND'LY, <i>adv.</i>	
ROUND'NESS, <i>n. s.</i>	

angles; smooth: hence unbroken; plain; clear; candid; free; quick; brisk: a round is a circle or circular body; a revolution; rotation; step of a ladder; the rotary walk of an officer, or soldier, on guard: to round is to make circular or spherical; to divest of angles; mould to smoothness; raise into relief; move around; surround; encircle: as a verb neuter, to grow or become round in form; go round: round, as an adverb, signifies every way; in a revolution or rotation; circuitously: as a preposition, about; on every side of; all over: roundel is a round form or figure: rounder, an enclosure; circumvallation: round-head, the old nick-name of the Puritans, from their practice of cropping the hair: round-house, a kind of watch-house: roundish, roundly, and roundness, follow the senses of round, adjective.

The terror of God was upon the cities *round* about.

Genesis.

The whole period and compass of this speech was delightful for the *roundness*, and grave for the strangeness.

Spenser.

She called for a *round* sum out of the privy purse.

Hooker.

Injoin gainsayers, giving them *roundly* to understand that where our duty is submission, weak oppositions betoken pride.

Id.

Three thousand ducats! 'tis a good *round* sum.

Shakspeare.

Let his queen mother all alone intreat him
To shew his griefs; let her be *round* with him.

Id.

Hie thee hither,

That I may pour my spirits in thine ear,
And chastise with the valour of my tongue
All that impedes thee from the golden *round*,
Which fate and metaphisick aid doth seem

To have crown'd thee withal. *Id.*

I'll charm the air to give a sound,
While you perform your antick *round*.

Id.

Whence he once attains the upmost *round*,
He then unto the ladder turns his back,
Looks in the clouds, scorning the base degrees
By which he did ascend.

Id.

We are such stuff

As dreams are made on, and our little life
Is *rounded* with a sleep.

Id. Tempest.

This distempered messenger of wet,
The many-coloured Iris, *rounds* thine eyes.

Shakspeare.

If you fondly pass our proffered offer,
'Tis not the *rounder* of your old faced walls

Can hide you from our messengers of war. *Id.*

I was called any thing, and I would have done
any thing indeed too, and *roundly* too.

Id.

You'll prove a jolly surly groom,
That take it on you at the first so *roundly*.

Id.

The queen, your mother, *rounds* apace; we shall
Present our services to a fine new prince.

Id.

Round dealing is the honour of man's nature; and a mixture of falsehood is alike allay in gold and silver, which may make the metal work the better, but it embaseth it.

Bacon.

Worms with many feet, which *round* themselves into balls, are bred chiefly under logs of timber.

Id.

The Spaniards, casting themselves into *roundels*, and their strongest ships walling in the rest, made a flying march to Calais.

Id.

Hirsute roots are a middle sort between the bulbous and fibrous; that, besides the putting forth sap upwards and downwards, putteth forth in *round*.

Id.

All sounds whatsoever move *round*; that is, on

all sides, upwards, downwards, forwards, and backwards. *Id.*

This lord justice caused the earl of Kildare to be arrested, and cancelled such charters as were lately resumed, and proceeded every way so *roundly* and severely as the nobility did much distaste him.

Davies on Ireland.

Mr. de Mortier *roundly* said that, to cut off all contentions of words, he would propose two means for peace.

Hayward.

In his satyrs Horace is quick, *round*, and pleasant, and has nothing so bitter, so not so good as Juvenal.

Peacham.

A gentle *round* filled to the brink,

To this and t'other friend I drink.

Suckling.

Such new Utopians would have a *round* of government, as some the like in the church, in which every spawk becomes uppermost in his turn.

Holyday.

No end can to this be found,

'Tis nought but a perpetual fruitless *round*.

Cowley.

He did foretel and prophesy of him,

Who to his realms that azure *round* hath joined.

Denham.

Hollow engines, long and *round*d, thick rammed.

Milton.

The outside bare of this *round* world.

Id.

Knit your hands, and beat the ground

In a light fantastick *round*.

Id.

In darkness and with dangers compassed *round*.

Id.

One foot he centered, and the other turned

Round through the vast profundity obscure.

Id.

To those beyond the polar circle, day

Had unbenighted shone, while the low sun,

To recompence his distance, in your sight

Had *rounded* still the' horizon, and not known

The east or west.

Id. Paradise Lost.

They keep watch, or nightly *rounding* walk.

Milton.

The queen of night,

In her increasing horns, doth *rounder* grow,

Till full and perfect she appear in show.

Browne.

His style, though *round* and comprehensive, was incumbered sometimes by parentheses, and became difficult to vulgar understandings.

Fell.

From a world of phenomena, there is a principle that acts out of wisdom and counsel, as was abundantly evidenced, and as *roundly* acknowledged.

More's Divine Dialogues.

It is not every small crack that can make such a receiver, as is of a *roundish* figure, useless to our experiment.

Boyle.

Painting is a long pilgrimage; if we do not actually begin the journey, and travel at a *round* rate, we shall never arrive at the end of it.

Dryden.

They meet, they wheel, they throw their darts afar;

Then in a *round* the mingled bodies run;

Flying they follow, and pursuing shun.

Id.

All the *rounds* like Jacob's ladder rise;

The lowest hid in earth, the topmost in the skies.

Id.

Round the world we roam,

Forced from our pleasing fields and native home.

Id.

If nothing will please people, unless they be greater than nature intended, what can they expect, but the ass's *round* of vexatious changes?

L'Strange.

Those sincerely follow reason, but for want of having large, sound, *roundabout* sense, have not a full view of all that relates to the question.

Locke on Understanding.

When silver has been lessened in any piece carrying the public stamp, by clipping, washing, or *rounding*, the laws have declared it not to be lawful money.

Locke.

When the mind has brought itself to attention, it will be able to cope with difficulties, and master them, and then it may go on *roundly*.

Id.

With the cleaving-knife and mawl split the stuff into a square piece near the size, and with the draw-knife *round* off the edges to make it fit for the lathe.

Moxon.

How then to drag a wretched life beneath

An endless *round* of still returning woes,

And all the gnawing pangs of vain remorse?

What torment's this!

Smith.

This is the last stage of human perfection, the utmost *round* of the ladder whereby we ascend to heaven.

Norris.

Your petitioner always kept hospitality, and drank confusion to the *roundheads*.

Spectator.

They set a *round* price upon your head.

Addison.

It is not easy to foresee what a *round* sum of money may do among a people who have tamely suffered the Franche Compté to be seized on.

Id. Remarks on Italy.

Sir Roger heard them upon a *round* trot.

Addison.

The mouth of Vesuvius has four hundred yards in diameter; for it seems a perfect *round*.

Id.

Some preachers, prepared only upon two or three points, run the same *round* from one end of the year to another.

Id.

The figures on our modern medals are raised and *rounded* to a very great perfection.

Id.

He affirms every thing *roundly*, without any art, rhetoric, or circumlocution.

Id. C. Tarriff.

Many are kicked down ere they have climbed the two or three first *rounds* of the ladder.

Government of the Tongue.

At the best 'tis but cunning; and, if he can in his own fancy raise that to the opinion of true wisdom, he comes *round* to practise his deceits upon himself.

Id.

Till by one countless sum of woes oppress,

Hoary with cares, and ignorant of rest,

We find the vital springs relaxed and worn;

Compelled our common impotence to mourn.

Thus through the *round* of age to childhood we return.

Prior.

The vilest cockle gaping on the coast,

That *rounds* the ample sea.

Id.

Bracelets of pearl gave *roundness* to her arm,

And every gem augmented every charm.

Id.

Pliny put a *round* number near the truth, rather than a fraction.

Arbutnot on Coins.

Women to cards may be compared; we play

A *round* or two; when used, we throw away.

Granville.

Paraphrase is a *roundabout* way of translating, invented to help the barrenness, which translators, overlooking in themselves, have apprehended in our tongue.

Felton.

Can any one tell how the sun, planets, and satellites were *rounded* into their particular spheroidal orbs?

Cheyne.

If merely to come in, Sir, they go out;

The way they take is strangely *roundabout*.

Pope.

They marched to some famed *roundhouse*.

Id.

These accomplishments, applied in the pulpit, appear by a quaint, terse, florid style, *rounded* into periods and cadences, without propriety or meaning.

Swift's Miscellanies.

Roundness is the primary essential mode or difference of a bowl.

Watt's Logic.

ROUND, *v. n.* Sax. *puman*; Germ. *runch*; whence Chaucer writes it *roun*. To whisper. Obsolete.

Being come to the supping place, one of Kalender's servants rounded in his ear; at which he retired. *Sidney.*

They're here with me already; whispering, *rounding,*

Sicilia is a so forth; 'tis far gone. *Shakspeare.*

Cicero was at dinner, where an ancient lady said she was but forty: one that sat by rounded him in the ear, she is far more out of the question: Cicero answered, I must believe her, for I heard her say so any time these ten years. *Bacon.*

The fox rounds the new elect in the ear, with a piece of secret service that he could do him. *L'Estrange.*

ROUND^{EL}, *n. s.* } Fr. *rondetlet*. A kind
ROUND^{ELAY}. } of poetry which commonly consists of thirteen verses, of which eight are of one kind of rhyme and five of another.

Siker, sike a roundle never heard I none,
Little lacket Perigot of the best,

And Willie is not greatly over-gone,
So weren his under-songs well address. *Spenser.*

To hear thy rimes and roundelays,
Which thou wert wont in wasteful hills to sing,
I more delight than lark in summer days,
Whose echo made the neighbouring groves to ring. *Id.*

Come now, a roundel and a fairy song. *Shakspeare.*

The muses and graces made festivals; the fawns, satyrs, and nymphs did dance their roundelays. *Howel.*

They listening heard him, while he searched the grove,
And loudly sung his roundelay of love,
But on the sudden stopped. *Dryden's Knight's Tale.*

ROUNDS, in military matters, a detachment from the main guard, of an officer or a non-commissioned officer and six men, who go round the rampart of a garrison to listen if any thing be stirring without the place, and to see the sentinels be diligent upon their duty, and all in order. In strict garrisons the rounds go every half hour. The sentinels are to challenge at a distance, and to rest their arms as the round passes. All guards turn out, challenge, exchange the parole, and rest their arms, &c.

ROUSE, *n. s.* Teut. *rusch*, half drunk. Hence our word carouse. A dose of liquor rather too large. Not in use.

They have given me a rouse already,
—Not past a pint as I am a soldier. *Shakspeare.*

No jocund health that Denmark drinks to-day,
But the great cannon to the clouds shall tell;
And the king's rouse shall bruit it back again,
Bespeaking earthly thunder. *Id.*

ROUSE', *v. a., v. n., & n. s.* } Gothic *reisa*
ROU'SER, *n. s.* } Swed. *resa*. See
RAISE. To wake up; wake from rest; excite to action; drive from a covert: as a verb neuter to awake from slumber or inaction; be excited: a rouser is the agent or instrument of rousing.

He stooped down, he couched as a lion, and as an old lion; who shall rouse him up? *Gen. xlix. 9.*

As an eagle, seeing prey appear,
His hairy plumes doth rouse full rudely dight;
So shook he, that horror was to hear.

Faerie Queene.

The blood more stirs,
To rouse a lion, than to start a hare. *Shakspeare.*

Then rouse that heart of thine,
And whatsoever heretofore thou hast assumed to be,
This day be greater. *Chapman.*

The unexpected sound
Of dogs and men his wakeful ear does wound;
Roused with the noise, he scarce believes his ear,
Willing to think the illusions of his fear
Had given this false alarm. *Denham.*

Men, sleeping found by whom they dread,
Rouse and bestir themselves ere well awake. *Milton.*

Blustering winds had roused the sea. *Id.*
At once the crowd arose, confused, and high;
For Mars was early up, and roused the sky. *Dryden.*

I'll thunder in their ears their country's cause,
And try to rouse up all that's Roman in them. *Addison.*

Richard, who now was half asleep,
Roused; nor would longer silence keep. *Prior.*

The heat with which Luther treated his adversaries, though strained too far, was extremely well fitted by the providence of God to rouse up a people, the most phlegmatick of any in Christendom. *Atterbury.*

Now Cancer glows with Phœbus' fiery ear,
The youth rush eager to the sylvan war;
Swarm o'er the lawns, the forest walks surround,
Rouse the fleet hart, and cheer the opening hound. *Pope.*

Melancholy lifts her head;
Morpheus rouses from his bed. *Id. St. Cecilia.*

And when they smiled because he deemed it near,
His heart more truly knew that peal too well
Which stretched his father on a bloody bier,
And roused the vengeance blood alone could quell:
He rushed into the field, and, foremost fighting, fell. *Byron.*

ROUSE (John), an English antiquary of the fifteenth century, who was born in Warwickshire; and lived at Guy's Cliff, near Warwick. He wrote, 1. A Chronicle of the Kings of England; and 2. The Antiquities of Warwick. He died in 1491.

ROUSSEAU (James), an eminent painter, born in Paris in 1630. He studied first under Swanevelt, after which he travelled into Italy, practising in perspective, architecture, and landscape. On his return home he was employed at Marly. He distinguished himself in painting buildings, and, from his knowledge of perspective, Louis XIV. employed him to decorate his hall at St. Germaine-en-Laye, where he represented the operas of Lulli. Being a Protestant, he quitted France on the persecution of his brethren, and retired to Switzerland. Louis invited him back: he refused, but sent his designs, and recommended a proper person to execute them. After a short stay in Switzerland, he went to Holland; whence he was invited to England by Ralph duke of Montagu, to adorn his new house in Bloomsbury. Some of his pictures, both in landscape and architecture, are at Hampton Court; and he etched some of his own designs. He died in Soho Square, London, in 1693.

ROUSSEAU (Jean Baptiste), a celebrated French poet, born in Paris in April, 1671. His father, who was a shoemaker, in good circumstances, had him educated in the first colleges of Paris. He distinguished himself while young by several short poetical pieces, and was admitted as an eleve, into the Academy of Inscriptions

and Belles Lettres, in 1701. He attended marshal Tallard into England as his secretary, and contracted a friendship with St. Evremond. On his return to Paris he was admitted at court, till in 1708, he was prosecuted as the author of some couplets, in which the characters of several persons were calumniated, in consequence of which he was banished in 1712 by a decree of the parliament of Paris. After this sentence he lived in foreign countries, where he found illustrious protectors. The count de Luc, ambassador of France in Switzerland, took him with him to Baden in 1714, and presented him to prince Eugene, who took him to Vienna, and introduced him to the emperor. Rousseau lived about three years with prince Eugene; but having lost his favor, by satirising one of his mistresses, he retired to Brussels, where he afterwards usually resided. It was here that he became acquainted with Voltaire, who admired his poetry, and made him a present of all his works. He came over, in 1721, to England, where he printed a collection of his works, in 2 vols. 12mo., London. This edition, published in 1723, brought him nearly 10,000 crowns, which he placed in the hands of the Ostend company, where he soon lost the whole of it. He now found an asylum in the establishment of the duke of Aremberg, whose table was open to him at all times, and who, being obliged, in 1733, to go to the army in Germany, settled on him a pension of 1500 livres. But, having been imprudent enough to publish in a journal that the duke d'Aremberg was the author of those verses for which he himself had been banished France, he was dismissed from his table, and his pride would not allow him to accept the pension after this rupture. The count de Luc and M. de Senozan, receiver-general of the church revenue, now invited him to come privately to Paris, in the hopes of procuring a diminution of the period of his banishment, but all their attempts proved abortive; and after having staid three months at Paris, he returned to Brussels in February, 1740, where he died 1741. M. Seguy, in concert with the prince of la Tour Tassis, published a very beautiful edition of his works, in 3 vols. 4to., agreeable to the poet's last corrections. There is a larger collection in five volumes, which did both injury and honor to his memory, as he in it speaks both in favor of and against the very same persons.

ROUSSEAU (Jean Jacques), a celebrated French writer, born at Geneva in 1712. His father was a watchmaker. His education was but scanty, but he made up for this by self-application. His friends put him apprentice to an engraver, from whom he says he learnt to be idle, and even to steal; at length he eloped from him. Bornex, bishop of Anneci, from whom he solicited an asylum, committed the care of his education to madame de Warrens, a lady who had in 1725 left part of her wealth, and the Protestant religion, to throw herself into the church. By her assistance he went to Turin with letters of recommendation, and was admitted into a seminary there, having been first made a proselyte to the Roman Catholic religion by his benefactress. He was soon disgusted with his new life, which he quitted almost pennyless, and was obliged to engage

himself as a footman to a lady of quality. She dying in three months, her nephew procured him another place out of livery. He next commenced teaching music at Chamberi, where he remained till 1741, when he went to Paris, where he was long in very destitute circumstances. Meanwhile he began to emerge from obscurity, and the place of deputy under M. Dupin, farmer general, a man of parts, afforded him temporary relief, and enabled him to be of some benefit to Mad. de Warrens. The year 1750 was the commencement of his literary career. The academy of Dijon had proposed the question: 'Whether the revival of the arts and sciences has contributed to the refinement of manners?' He supported the negative side of the question, and the academy crowned his work. From that period he increased in celebrity. His next work was *A Discourse on the Causes of Inequality among Mankind*, and on the *Origin of Social Compacts*, a work written with a view to prove that mankind are equal; that they were born to live apart from each other; and that they have perverted the order of nature in forming societies. He bestows the highest praise on the state of nature, and depreciates the idea of every social compact. By presenting this performance to the magistrates, he was received again into his native country, and reinstated in all the privileges and rights of a citizen, after having abjured the Catholic religion. He soon however returned, and lived for some time in Paris, and afterwards retired into the country. His *Letter to M. de Alembert on the design of erecting a theatre at Geneva*, in 1757, first drew down upon him the envy of Voltaire, and was the cause of those indignities with which that author never ceased to load him. In 1752 he gave to the theatre a pastoral, *The Village Conjuror*, of which he composed both the poetry and music. His *Dictionary of Music* affords several excellent articles; some of them, however, are very inaccurate. Rousseau, soon after his *Village Conjuror*, published *A Letter on, or rather against, French Music*, in consequence of which he was insulted, menaced, and lampooned. Harmonic fanaticism went even to hang him up in effigy. He next published the *New Heloise*, an epistolary romance, in six parts, 1761, 12mo. His *Emilius* afterwards obtained him more fame than the *New Heloise*. This moral romance, which was published in 1762, in 4 vols. 12mo., treats chiefly of education. See *EDUCATION*. He dwelt from 1754 in a small house in the country near Montmorenci; a retreat which he owed to the generosity of a farmer general. The French parliament condemned his *Emilius* in 1762, and entered a criminal prosecution against the author, which forced him to make a precipitate retreat; and he found an asylum in Neuchâtel. His first care was to defend his *Emilius* against the archbishop of Paris, by whom it had been anathematised. The *Letters of La Montaigne* appeared soon after; but this work, far less eloquent, and full of envious discussions on the magistrates and clergy of Geneva, irritated the Protestant ministers without effecting a reconciliation with the Romish clergy. The protection of the king of Prussia, to whom Neuchâtel belonged, was not

sufficient to rescue him from that obloquy which the minister of Montiers Travers, the village to which he had retired, had excited against him. On the night between the 6th and 7th of September, 1765, some fanatics attacked his house, and, fearing new insults, he in vain sought an asylum in Bern. As this canton was connected with Geneva they did not allow him to remain in the city. Obligated to set out on a journey, in a very inclement season, he reached Strasburg in a destitute situation. He waited there till the weather was milder, when he went to Paris, where Mr. Hume then was, who proposed taking him with him to England. After some stay in Paris, in the disguise of an Armenian, Rousseau set out for London in 1766. Hume, much affected with his situation and his misfortunes, procured for him a very agreeable settlement. He did not however make such an impression on the minds of the English as he had done on the French. The periodical prints were filled with satires against him; and they published a forged letter from the king of Prussia, ridiculing the principles and conduct of this new Diogenes. Rousseau from this time treated Hume as an enemy, who he said had brought him to England with no other view than to expose him to public ridicule; and he therefore returned to France. On the 1st of July, 1770, Rousseau appeared for the first time at the Regency coffee-house, dressed in ordinary clothing, having for some time previous to this worn an Armenian habit. His friends procured for him liberty of staying, on condition that he should neither write on religion or politics. He died of an apoplexy at Ermenonville, belonging to the marquis de Girardin, about ten leagues from Paris, July 2d, 1778, aged sixty-six. This nobleman has erected to his memory a very plain monument, in a grove of poplars, which constitutes part of his beautiful gardens. On his tomb is inscribed in French—'Here reposes the man of Nature and of Truth.' Rousseau, during his stay near Lyons, married madame le Vasseur, his governess, a woman who, without beauty or talents, had gained over him a great ascendancy. There are several small pieces written by him, to be found in a collection of his works published in 25 vols. 8vo. and 12mo, to which there is appended a very insignificant supplement in 6 vols. The most important parts in this collection are selected from his Thoughts; in which the confident sophist and the impious author disappear, and nothing is offered to the reader but the eloquent writer and the contemplative moralist. There were found in his portfolio after his death, Confessions, in twelve books, which were afterwards published. His other works are, 1. The Reveries of a Solitary Wanderer, being a journal of the latter part of his life. 2. Considerations upon the Government of Poland. 3. The Adventures of Lord Edward, a novel, being a kind of supplement to the Nouvelle Héloïse. 4. Various Memoirs and Fugitive Pieces, with a great number of letters. 5. Emilia and Sophia. 6. The Levite of Ephraim, a poem. 7. Letters to Sara. 8. An Opera and a Comedy. 9. Translations of the first book of Tacitus's History of the Episode of Olinda and Sophronia, taken from Tasso, &c. &c.

ROUT, *n. s. & v. a.* Goth. and Swed. *rote*; Belg. *rot*. A clamorous multitude; a rabble; a tumultuous crowd; confusion: to put to confusion; to assemble in tumultuous crowds.

The next way to end the wars with him, and to rout him quite, should be to keep him from invading of those countries adjoining. *Spenser.*

A rout of people there assembled were,
Of every sort and nation under sky. *Id.*

If that rebellion
Came like itself in base and abject routs,
Led on by bloody youth, goaded with rage,
And countenanced by boys and beggary,
You, reverend father, then had not been there. *Shakspeare.*

Farmers were to forfeit their holds in case of unlawful retainer, or partaking in routs and unlawful assemblies. *Bacon.*

The meaner sort routed together, and suddenly assailing the earl, in his house, slew him. *Id. Henry VII.*

Thy army,
As if they could not stand when thou wer't down,
Dispersed in rout, betook them all to fly. *Daniel.*
Fancy, wild dame, with much lascivious pride,
By twin chameleons drawn, does gaily ride,
Her coach there follows, and throngs round about,
Of shapes and airy forms an endless rout. *Cowley.*

That party of the king's horse that charged the Scots, so totally routed and defeated their whole army that they fled. *Clarendon.*

Nor do I name of men the common rout,
That wandering loose about,
Grow up and perish, as the summer fly. *Milton.*
Their mightiest quelled, the battle swerved,
With many an inroad gored; deformed rout
Entered and foul disorder. *Id. Paradise Lost.*

The mad ungovernable rout,
Full of confusion, and the fumes of wine,
Loved such variety and antic tricks. *Roscommon.*

Harley spies
The doctor fastened by the eyes
At Charing-cross among the rout,
Where painted monsters are hung out. *Swift.*
ROUTE, *n. s.* Fr. *route*. Road; way.

Wide through the furzy field their route they take,
Their bleeding bosoms force the thorny brake. *Gay.*

ROW, *n. s.* Sax. *pa*; Goth. and Swed. *ra*; Teut. *reih*. A rank or file; a number of things ranged in a line.

Lips never part but that they show
Of precious pearl the double row. *Sidney.*
After them all dancing on a row,
The comely virgins came with garlands dight,
As fresh as flowers. *Spenser.*

A new born wood of various lines there grows,
And all the flourishing letters stand in rows. *Cowley.*

Where any row
Of fruit trees, overwooded reached too far
Their pampered boughs, and needed hands to check
Fruitless embraces. *Milton's Paradise Lost.*

Where the bright seraphim in burning row,
Their loud uplifted angel trumpets blow. *Milton.*
The victor honoured with a nobler vest,
Where gold and purple strive in equal rows. *Dryden.*

Why round our coaches crowd the white-gloved
beaux,
Why bows the side box from its inmost rows? *Pope.*

Row, *v. n. & v. a.* } Sax. *ropan*; Goth. *rot*.
Row'ER, *n. s.* } To impel a vessel in

water by oars; to drive by oars; a rower is one who manages oars.

He saw them toiling in *rowing*; for the wind was contrary. *Mark* vi. 48.

Some of these troughs or canoes were so great that above twenty men have been found *rowing* in one. *Abbot*.

The swan *rows* her state with oary feet. *Milton*.

The bold Britons then securely *row'd*;

Charles and his virtue was their sacred load.

Waller.

The watermen turned their barge, and *rowed* softly, that they might take the cool of the evening. *Dryden*.

Four galleys first, which equal *rowers* bear, Advancing in the watery lists appear. *Id*.

The bishop of Salisbury ran down with the stream thirty miles in an hour, by the help of but one *rower*. *Addison*.

ROWE (Nicholas), an eminent English poet, the son of John Rowe, esq., serjeant at law, was born at Little Barford, Bedfordshire, in 1673. He acquired a knowledge of the classic authors under Dr. Busby in Westminster school; but poetry was his early and darling study. His father, who designed him for his own profession, entered him a student in the Middle Temple. He made considerable advances in the law; but the love of the belles lettres and poetry stopped him in his career. His first tragedy, *The Ambitious Stepmother*, meeting with universal applause, he laid aside all thoughts of the law. He afterwards composed several tragedies; but he valued himself most upon his *Tamerlane*. The others are the *Fair Penitent*, *Ulysses*, *The Royal Convert*, *Jane Shore*, and *Lady Jane Gray*. He also wrote a poem called *The Biter*, and several poems upon different subjects, which have been published under the title of *Miscellaneous Works*, in one volume, as his dramatic works have been in two. 'Rowe is chiefly to be considered,' says Dr. Johnson, 'in the light of a tragic writer and a translator. In his attempt at comedy, he failed so ignominiously, that his *Biter* is not inserted in his works; and his occasional poems are rarely worthy of either praise or censure. In the construction of his dramas there is not much art. He is not a nice observer of the unities; nor does he much affect the auditor, except in *Jane Shore*, who is always seen and heard with pity. Whence then has Rowe his reputation? From the reasonableness and propriety of some of his scenes, from the elegance of his diction, and the suavity of his verse. He seldom moves either pity or terror, but he often elevates the sentiment; he seldom pierces the breast, but he always delights the ear, and often improves the understanding.' Being a great admirer of Shakspeare, he gave the public an edition of his plays. But the most considerable of Mr. Rowe's performances was a translation of Lucan's *Pharsalia*, which he just lived to finish, but it did not appear in print till 1728, ten years after his death. The duke of Queensberry, when secretary, made him under-secretary. After the duke's death all avenues were stopped to his farther preferment; and during the rest of queen Anne's reign he passed his time in study. On the accession of George I. he was made poet laureat, and one of the land-surveyors of the

customs in the port of London. The prince of Wales conferred on him the clerkship of his council; and the lord chancellor Parker made him his secretary for the presentations. He did not enjoy these promotions long; for he died December 6, 1718, aged forty-five. He was twice married, and had a son by his first wife, and a daughter by his second. He was interred in Westminster Abbey, in the Poet's Corner, opposite to Chaucer.

ROWE (Elizabeth), an English lady, eminent for her writings, born at Ilchester, in Somersetshire, in 1674. She had a taste for both painting and poetry, and was very fond of music. In 1696 a collection of her poems was published. Her paraphrase on the thirty-eighth chapter of Job was written at the request of bishop Ken. She married, in 1710, Mr. Thomas Rowe, the translator of *Plutarch's Lives*; but intense study soon threw him into a consumption, which put a period to his life in May, 1715, when he was but just twenty-eight. Mrs. Rowe wrote an elegy on his death; and continued to the last moments of her life to express the highest veneration and affection for his memory. Soon after his decease, she retired to Frome, in Somersetshire. In this recess she composed the most celebrated of her works, *Friendship in Death*, and *Letters Moral and Entertaining*. In 1736 she published *The History of Joseph*; a poem written in her younger years. She died of an apoplexy, February 20, 1736-7. In her cabinet were found letters to several of her friends, which she had ordered to be delivered after her decease. The Rev. Dr. Isaac Watts, agreeably to her request, revised and published, in 1737, her *Devout Exercises of the Heart in Meditation and Soliloquy, Praise and Prayer*; and, in 1739, her *Miscellaneous Works*, in prose and verse, were published in 2 vols. 8vo., with an account of her life and writings prefixed.

ROWEL, *n. s. & v. a.* Fr. *rouelle*. The points of a spur turning on an axis: to pierce the skin and keep the wound open.

A rider like myself, who ne'er wore rowel
Nor iron on his heel. *Shakspeare. Cymbeline*.

A mullet is the rowel of a spur, and hath never but five points; a star hath six. *Peacham*.

He spurred his fiery steed
With gory rowels to provoke his speed. *Dryden*.

Rowel the horse in the chest. *Mortimer*.

ROWEN, *n. s.* Teut. *rauке*, grass. After grass.

Then spare it for rowen, till Michel be past,
To lengthen thy dairie no better thou hast. *Tusser*.

Rowen is a field kept up till after Michaelmas, that the corn left on the ground may sprout into green.

Notes on Tusser.

Turn your cows, that give milk, into your rowens,
till snow comes. *Mortimer's Husbandry*.

ROWLEY (William), a dramatic writer who lived in the reign of Charles I. and was educated at the university of Cambridge. Wood styles him 'the ornament, for wit and ingenuity, of Pembroke Hall, in Cambridge.' He was a great benefactor to the English stage, having left us five plays of his own composing, and one in which Shakspeare afforded him some assistance.

ROWNING (John), an ingenious English mathematician, born in 1699. He was fellow of Magdalen College, Cambridge, and afterwards rector of Anderby, in Lincolnshire. In 1738 he printed, at Cambridge, *A Compendious System of Natural Philosophy*, in 2 vols. 8vo.; reprinted in 1745. He wrote also two pieces in the *Philosophical Transactions*, viz. 1. *A Description of a Barometer*, wherein the Scale of Variation may be increased at pleasure; vol. xxxviii. p. 39. And, 2. *Directions for making a Machine for finding the Roots of Equations universally*, with the manner of using it; vol. lx. p. 240. He died in London, November 1771.

ROXANA, a Persian princess, daughter of Darius, who, being taken prisoner by Alexander the Great, captivated her conqueror, who married her. After his death she behaved with great cruelty, for which she was put to death by Cassander. See MACEDON.

ROXBURGH, an ancient city of Roxburghshire, once famed for opulence and magnificence, of which very few relics now remain. It stood on a rising ground, opposite Kelso, at the west end of a fertile plain, peninsulated by the Tweed and the Tiviot, near a magnificent Cistercian monastery founded by David I. It was totally destroyed by king James II. and never afterwards rebuilt; and, as its site is now converted into arable fields, the plough has nearly obliterated all traces of its existence. At the point of the peninsula stood the castle, memorable in the Scottish history, as an object of frequent mortal contention between the Scots and English; and before which king James II. was killed by the bursting of a cannon. This castle is now entirely in ruins.

ROXBURGH, or ROXBURGHSHIRE, a county of Scotland, so named from the above ancient city, called also Teviotdale, from the Teviot which runs through it; extending about thirty miles from east to west, and fifteen in breadth from the English border to the Blue Cairn in Lauderdale Moor; but of an irregular figure. It is bounded on the north by Lauderdale and Berwickshire; on the east and south-east by Northumberland and Cumberland; on the south and south-west by Annandale; and on the west by Dumfries and Selkirk shires. It is divided into three districts, called Teviotdale, Liddesdale, and Eskdale, from their chief rivers, the Teviot, Liddel, and Esk. On the north and west the county is mountainous, and chiefly appropriated to pasture; but on the south and east considerably level and fertile. The whole abounds with the most romantic scenery, exhibiting the rough appearance of hills, mosses, rocks, and mountains, interspersed with delightful fertile valleys, through which run numerous rivers and rivulets. The chief mountains are the Cheviot and Cockraw Hills, which are situated in what was called the Debateable Lands: from the property of them being often the subject of debate between the two kingdoms, but finally adjudged to Scotland at the Union. This county contains one royal borough, viz. Jedburgh; and several considerable towns, as Kelso, Hawick, Melrose, and Castletown. Before the union of the crowns, while predatory wars were frequent between the

two kingdoms, 10,000 horsemen, well armed and accoutred, could have been raised in twenty-four hours. Even after that period, and before the union of the kingdoms, the profits of a very lucrative contraband trade enriched the people and kept up the population. The recent improvements, however, in cultivation, manufactures, improvements in the breed of sheep and wool, and other arts of peace, are now making up for these deficiencies, and increasing the population and prosperity of the borders of both kingdoms, without danger of interruption and depredations from predatory inroads on either side. This county sends one member to the imperial parliament. There are many ancient forts and castles; and the ancient Roman road, called the Rugged Causeway, can be traced from Hounan to the Tweed.

ROXBURY, a township of the United States, in Norfolk county, Massachusetts, two miles S.S.W. of Boston. It contains many handsome houses and country seats. The soil is in a high state of cultivation, and the inhabitants supply Boston with great quantities of vegetables and fruit. Population 3669.

ROY'AL, *adj.* } Fr. *roial*; Ital. and
ROY'ALIST, *n. s.* } Span. *real, reale*, of Lat.
ROY'ALIZE, *v. a.* } *regalis*. Kingly; belonging
ROY'ALLY, *adv.* } to or becoming a king
ROY'ALTY, *n. s.* } regal; all the derivatives
corresponding.

What news from Venice
How doth that royal merchant, good Antonio?
Shakspeare.

Ere you were queen, ay, or your husband king,
To royalise his blood, I spilt mine own. *Id.*

It shall be my care,
To have you royally appointed. *Id.*

Draw, you rascal; you come with letters against
the king, and take vanity the puppet's part against
the royalty of her father. *Id. King Lear.*

Royalty by birth was the sweetest way of majesty:
a king and a father compounded into one, being of a
temper like unto God, justice and mercy. *Holyday.*

Wherefore do I assume
These royalties, and not refuse to reign? *Milton.*
The royal stock of David. *Id.*

Where Candish fought the royalists prevailed,
Neither his courage nor his judgment failed.
Waller.

His body shall be royally interred,
And the last funeral pomp adorn his hearse.
Dryden.

If they had held their royalties by this title, either
there must have been but one sovereign, or else every
father of a family had as good a claim to royalty as
these. *Locke.*

The old church of England royalists, another name
for a man who prefers his conscience before his inter-
ests, are the most meritorious subjects in the world,
as having passed all those terrible tests which domi-
neering malice could put them to, and carried their
credit and their conscience clear. *South.*

I will, alas! be wretched to the great,
And sigh in royalty, and grieve in state. *Prior.*

Thrice happy they, who thus in woods and groves,
From courts retired, possess their peaceful loves:
Of royal maids how wretched is the fate! *Graville.*

ROYAL SOCIETY. See SOCIETY.
ROYENA, in botany, African bladder-nut; a
genus of the digynia order, and decandria class

of plants; natural order eighteenth, bicornes: CAL. urceolated; cor. monopetalous, with the limb revolved: caps. unilocular and quadrivalved. Species seven, all Cape herbs.

ROY'NISH, *adj.* Fr. *rogneux*, mangy, paltry. Paltry; sorry; mean; rude.

The *roynish* clown, at whom so oft

Your grace was wont to laugh, is also missing.

Shakspeare.

ROYSE (George), D. D., an English divine, born at Martock, in Somersetshire, about 1655; and educated at St. Edmund Hall, Oxford. He became chaplain to king William III., and attended him to Ireland in 1690. He was made dean of Bristol, and died in 1708.

ROYSTON, a market town in Hertfordshire. The name of the town is derived from a cross erected in the commencement of the twelfth century by a lady Roise, and hence called Roise's Cross. A monastery was afterwards built near it, and largely endowed. Houses gradually arose round the monastery, and the name was changed to Roise's Town, or Royston. The town is now noted chiefly for its corn trade. The church is an ancient edifice, consisting of a nave, chancel, and aisles. The market is on Wednesday, and it has five annual fairs. Thirty-seven miles north of London.

ROYTELET, *n. s.* Fr. *roytelet*. A little petty king.

Causing the American *roytelets* to turn all homagers to that king and the crown of England.

Haylin.

ROZEE (Madame), an extraordinary paintress, born at Leyden in 1632. She neither used oil nor water colors, but wrought on the rough side of the pannel, with a preparation of silk floss, disposed in different boxes, according to the different degrees of bright and dark tints, out of which she applied the colors requisite, and blended, softened, and united the tints with surprising beauty. In this singular manner she executed portraits, landscapes, and historical subjects. She died in 1682, aged fifty.

RUATAN, an island of the bay of Honduras, thirty miles long, and nine wide; fortified by rocks and shoals, which defend the fort, and also by the narrowness of the port, into which only one vessel can enter at a time. Yet it is capable of containing 500 vessels in perfect safety. From the sea this island appears singularly beautiful. It is entirely covered with the cocconut and other trees; and the soil is fertile. It abounds with deer, wild hogs, Indian rabbits, and birds of many species: parrots are innumerable. The Spaniards have a kind of military station or look-out post here. The small adjoining islands of Helene, Moratte, and Borburette, are separated from this by a narrow channel, and seem like detached parts of it. In the south are some ports, and besides these, some little channels fit for small vessels. In the west part of the island are meadows, in which mules are bred.

RUB, *v. a., v. n. & n. s.* } Welsh, *rhubco*;
RUB'BER, *n. s.* } Teut. *reiber*; Swed.
RUBSTONE. } *rubba*. To scour or smooth by friction; pass one body over another; to wipe; cleanse; polish; 'to rub up' is to

V. M. XIX.

excite or to polish; 'rub down,' curry a horse; as a verb neuter, to rub is to fret; make a friction; pass or force a way through difficulty: a rub, the act of rubbing; collision; hence difficulty; hindrance: rubber, the instrument or agent in rubbing; a game; a courtesy: rubstone, a whetstone.

A cradle for barlie, with *rub-stone* and sand.

Tusser.

He, who before he was espied, was afraid, after being perceived, was ashamed, now being hardly *rubbed* upon, left both fear and shame, and was moved to anger.

Sidney.

Look, how she *rub*s her hands,
—It is an accustomed action with her, to seem thus washing her hands.

Shakspeare. Macbeth.

We'll play at bowls,
—'Twill make me think the world is full of *rub*s,
And that my fortune runs against the bias.

Shakspeare.

To sleep! perchance to dream; ay, there's the *rub*.

Id.

Upon this *rub*, the English ambassadors thought fit to demur, and sent to receive directions.

Hayward.

No hunters, that the tops of mountains scale,
And *rub* through woods with toils seek them all.

Chapman.

He expounds the giddy wonder

Of my weary steps, and under

Spreads a path clear as the day,

Where no churlish *rub* says nay.

Crashaw.

The government at that time was by kings, before whom the people in the most formal expressions of duty and reverence used to *rub* their noses, or stroke their foreheads.

Heylin.

Their straw-built citadel now *rubbed* with balm.

Milton.

When his fellow beasts are weary grown,
He'll play the groom, give oats, and *rub* 'em down.

Dryden.

He that once sins, like him that slides on ice,
Goes swiftly down the slippery ways of vice;
Though conscience checks him, yet, those *rub*s gone o'er,

He slides on smoothly, and looks back no more. *Id.*

Servants blow the fire with puffing cheeks, and lay
The *rubbers*, and the bathing sheets display. *Id.*

'Tis as much as one can do to *rub* through the world, though perpetually a doing. *L'Estrange.*

The ass was to stand by, to see two boobies try their title to him by a *rubber* of cuffs. *Id.*

The bare *rubbing* of two bodies violently produces heat, and often fire.

Locke.

If their minds are well principled with inward civility, a great part of the roughness, which sticks to the outside for want of better teaching, time and observation will *rub off*; but if ill, all the rules in the world will not polish them. *Id.*

The rough or coarse file, if large, is called a *rubber*, and takes off the unevenness which the hammer made in the forging. *Moxon.*

The whole business of our redemption is to *rub* over the defaced copy of the creation, to reprint God's image upon the soul.

South.

You will find me not to have *rubbed* up the memory of what some heretofore in the city did. *Id.*

In narrow clefts, in the monument that stands over him, catholics *rub* their beads, and smell his bones, which they say have in them a natural perfume, though very like apoplectick balsam; and what would make one suspect that they *rub* the marble with it, it is observed that the scent is stronger in the morning than at night.

Addison on Italy.

F

A forcible object will *rub out* the freshest colours at a stroke, and paint others. *Collier of the Aspect.*

If butchers had but the manners to go to sharps, gentlemen would be contented with a *rubber* at cuffs.

Id. on Duelling.

Two bones, *rubbed* hard against one another, produce a fetid smell. *Arbuthnot on Aliments.*

An hereditary right is to be preferred before election; because the government is so disposed that it almost executes itself; and, upon the death of a prince, the administration goes on without any *rub* or interruption. *Swift.*

Rub the dirty tables with the napkins, for it will save your wearing out the common *rubbers*. *Id.*

RUBBER, INDIA. See CAOUTCHOUC.

RUBBAGE, *n. s.* } From *rub*; meaning,
RUBBISH. } At first, dust made by

rubbing. Rubbage is not now used. Ruins of a building; fragments of matter used in building.

What trash is Rome!

What *rubbish*, and what offal! when it serves

For the base matter to illuminate

So vile a thing as Caesar.

Shakspeare.

Such conceits seem too fine among this *rubbage*.

Wotton.

A fabric, though high and beautiful, if founded on *rubbish*, is easily made the triumph of the winds.

Glanville's Scopsis.

The Almighty cast a pitying eye,

He saw the town's one half in *rubbish* lie. *Dryden.*

When the foundation of a state is once loosened, the least commotion lays the whole in *rubbish*.

L'Estrange.

Knowledge lying under abundance of *rubbish*, his scope has been to remove this *rubbish*, and to dress up crabbed matters as agreeably as they can. *Daven.*

That noble art of political lying ought not to lie any longer in *rubbish* and confusion.

Arbuthnot's History of John Bull.

The enemy hath avoided a battle, and taken a surer way to consume us, by letting our courage evaporate against stones and *rubbish*. *Swift.*

RUBBLE-STONE, *n. s.* From *rub*.

Rubble-stones owe their name to their being rubbed and worn by the water, at the latter end of the deluge, departing in hurry and with great precipitation.

Woodward.

RUBENS (Sir Peter Paul), the most eminent of the Flemish painters, was born in 1577, at Cologne. His father, who was a counsellor in the senate at Antwerp, had been compelled by the civil wars to seek refuge in Cologne, and, during his residence there, Rubens was born. He soon discovered a strong inclination for designing, and his mother, perceiving her son's bias, permitted him to attend the instructions of Tobias Verhaecht, a painter of architecture and landscape. He next became the pupil of Adam Van Ort, but his surly temper quickly disgusted Rubens, whose natural disposition was amiable. He then became the disciple of Octavio Van Veen, or Otto Venius, a painter of singular merit, and who was not only skilled in the principles of his art but also distinguished for critical learning. Rubens now gave up his whole mind to painting, and soon equalled his master. To arrive at that perfection which he already beheld in idea, he travelled through Italy, visiting the most valuable collections of paintings and antique statues with which that country abounds. Having finished some fine paintings for the arch-

duke Albert's palace, he was recommended by him to the duke of Mantua, by whom he was received with the most flattering marks of distinction, and where he studied the works of Julio Romano. He next visited Rome, where he examined the productions of Raphael, and the paintings of Titian and Paul Veronese called him to Venice. He continued in Italy seven years. At length hearing that his mother was ill he hastened to Antwerp, but she died before his arrival. He married soon after, but, his wife dying in four years, he retired from Antwerp, and endeavoured to sooth his melancholy by a journey into Holland. His fame now spread over Europe. He was invited by Mary of Medicis queen of Henry IV. of France to Paris, where he painted the galleries in the palace of Luxembourg. These form a series of paintings which delineate the history of that princess; and afford a decisive proof of his superiority in such compositions. At Paris he became acquainted with the duke of Buckingham, who employed him to explain to Isabella, the wife of Albert the archduke, the cause of the misunderstanding between the courts of England and Spain. In this employment Rubens acquitted himself so well, that Isabella appointed him envoy to the king of Spain, to propose terms of peace. Philip conferred on him the honor of knighthood, and made him secretary to his privy council. Rubens returned to Brussels, and thence passed over into England in 1630 with a commission from the Catholic king to negotiate a peace. He was successful, and a treaty was concluded, and Charles I. treated him with every mark of respect. Having engaged him to paint some of the apartments of Whitehall, he not only gave him a handsome sum of money, but, as an acknowledgment of his merit, created him a knight; and the duke of Buckingham purchased of him a collection of pictures, statues, medals, and antiques, to the value of £10,000. He returned to Spain, where he was highly honored and rewarded for his services. He was made a gentleman of the king's bed-chamber, and secretary to the council of state in the Netherlands. Rubens, however, did not lay aside his profession. He returned to Antwerp, where he married a second wife called Helena Forment, a celebrated beauty. He died on the 30th of May 1640, aged sixty-three, leaving a large fortune to his children. The figure of Rubens was noble, his manners engaging, and his conversation lively. He spoke several languages perfectly, and was an excellent statesman. His house at Antwerp contained one spacious apartment, in imitation of the rotunda at Rome, adorned with a choice collection of pictures which he had purchased in Italy; part of which he sold to the duke of Buckingham. His invention was so fertile that, when he painted the same subject several times, he always supplied something new. The attitudes of his figures are natural and varied, the carriage of the head is peculiarly graceful, and his expression noble and animated. He carried the art of coloring to its highest pitch. The great excellence of Rubens appears in his grander historical compositions; he touched them in such a manner as to give them a lasting force, beauty, and harmony. Yet,

with all his merits, Rubens is accused of want of correctness in designing. Though he had spent seven years in Italy in studying those antiques by which other celebrated artists had modelled their taste; though he had examined them with such minute attention as not only to perceive their beauties, but to be qualified to describe them in a Dissertation which he wrote on that subject; yet he seems never to have divested himself of that heavy style of painting, which, being peculiar to his native country, he had insensibly acquired. The astonishing rapidity, too, with which he painted, made him fall into inaccuracies, from which those works that he finished with care are entirely exempted. Among his finished pieces is the Crucifixion, lately to be seen at Antwerp; but of all his works the paintings in the palace of Luxemburg best display his genius and his style. Algarotti says, that he was more moderate in his movements than Tintoretto, and more soft in his chiaroscuro than Caravaggio; but not so rich in his compositions, nor so light in his touches as Paul Veronese; in his carnations less true than Titian, and less delicate than Vandyck. Yet he gave his colors the utmost transparency and harmony, notwithstanding their extraordinary deepness; and he had a strength and grandeur of style entirely his own.

RUBIA, in botany, madder, a genus of the monogynia order, and tetrandria class of plants; natural order forty-seventh, stellate: cor. is monopetalous and campanulated; and there are two monospermous berries. There are seven species, of which the most remarkable is the

R. tinctorum, or dyer's madder, so much used by the dyers and calico-printers. This has a perennial root and annual stalk; the root is composed of many long, thick, succulent fibres, almost as large as a man's little finger; these are joined at the top in a head like asparagus, and run very deep into the ground. From the upper part or head of the root come out many side roots, which extend just under the surface of the ground to a great distance, whereby it propagates very fast; for these send up a great number of shoots, which if carefully taken off in the spring, soon after they are above ground, become so many plants. These roots are of a reddish color, somewhat transparent; and have a yellowish pith in the middle, which is tough and of a bitter taste. From this root arise many large four cornered jointed stalks, which in good land will grow five or six feet long, and, if supported, sometimes seven or eight; they are armed with short herbaceous prickles; and at each joint are placed five or six spear-shaped leaves; their upper surfaces are smooth; but their mid rib on the under side is armed with rough herbaceous spines, and the leaves sit close to the branches in whorls. From the joints of the stalk come out the branches, which sustain the flowers: they are placed by pairs opposite; each pair crossing the other; these have a few small leaves towards the bottom, which are by threes, and upwards by pairs opposite: the branches are terminated by loose branching spikes of yellow flowers, which are cut into four parts resembling stars. These appear in June, and are sometimes suc-

ceeded by seeds, which seldom ripen in England. For the manner of its preparation for the use of dyers, see **MADDER** and **DYEING**. Madder root is used in medicine. It is an ingredient in the icteric decoction of the Edinburgh pharmacopœia. Madder colors the bones of animals, who have it mixed with their food: all the bones, particularly the more solid ones, are changed, both externally and internally, to a deep red; but neither the fleshy nor cartilaginous parts suffered any alterations: some of these bones macerated in water for many weeks together, and afterwards steeped and boiled in spirit of wine, lost none of their color, nor communicated any tinge to the liquors.

RUBIFIC, *adj.* } Lat. *ruber* and *facio*.
RUBIFORM, *adj.* } Making red: having a red
RUBIFY, *v. a.* } appearance: to make red:
RUBIFEROUS, *adj.* } red.

Diana's lip

Is not more smooth and *rubious*. *Shakspeare.*

This, typically applied, becomes a phænigmus or *rubifying* medicine, and of such fiery parts as to conceive fire of themselves, and burn a house.

Browne's Vulgar Errors.

While the several species of rays, as the *rubific*, are by refraction separated one from another, they retain those motions proper to each. *Grew.*

Of those rays, which pass close by the snow, the *rubiform* will be the least refracted; and so come to the eye in the directest lines. *Newton's Opticks.*

RUBRIC, *n. s. & adj.* Fr. *rubrique*; Lat. *rubrica*. Directions printed in books of law and prayer-books; so termed, because originally distinguished by being in red ink: red.

No date prefixed,

Directs me in the starry *rubricks* set. *Milton.*

They had their particular prayers according to the several days and months; and their tables or *rubricks* to instruct them. *Stillingfleet.*

The *rubrick* and the rules relating to the liturgy are established by royal authority, as well as the liturgy itself. *Nelson.*

The light and rays which appear red, or rather make objects appear so, I call *rubrick* or red making. *Newton.*

What though my name stood *rubrick* on the walls. *Pope.*

RUBUS, the bramble, a genus of the polygamia order and icosandria class of plants; natural order thirty-fifth, senticosæ: *cal.* quinquefid, petals five; the berry consisting of monospermous acini or pulpy grains. The principal species is the common raspberry, which, with its varieties, demands culture in every garden for the fruit; particularly the common red kind, white, and twice bearing raspberry; all of which are great bearers: but, for the general plantations, the common red and the white kind are chiefly preferred; planting also a share of the twice bearing sort, both as a curiosity and for the sake of its autumnal crops of fruit, which in favorable seasons ripen in tolerable perfection; observing to allow all the sorts some open exposure in the kitchen garden, though they will prosper in almost any situation. The other species are considered as plants of variety, for hardy plantations in the shrubbery. Some of them are also very ornamental flowering plants; particularly the Virginian flowering raspberry, and the double blossomed bramble, which have great

merit as furniture for ornamental compartments; and the white berried bramble, which is a great curiosity. All the other species and varieties serve to diversify large collections.

RUBY, *n. s.* Fr. *rubis*; Span. *rubí*, from Lat. *ruber*. A precious stone of a red color.

Up, up fair bride and call
Thy stars from out their several boxes, take
Thy rubies, pearls, and diamonds forth, and make
Thyself a constellation of them all. *Donne.*

You can behold such sights,
And keep the natural ruby of your cheeks,
When mine is blanch'd with fear. *Shakspeare.*

Wounds, like dumb mouths, do ope their ruby
lips. *Id.*

Melpomene would be represented like a manly
lady, upon her head a dressing of pearl, diamonds,
and rubies. *Peacham.*

Thrice upon thy finger's tip,
Thrice upon thy rubied lip. *Milton.*
Desire of wine

Thou could'st repress, nor did the dancing ruby
Sparkling, out-poured, the flavour, or the smell,
Or taste, that cheers the hearts of Gods and men,
Allure thee from the cool crystalline stream. *Id.*

Crowns were on thy royal scutcheons placed,
With sapphires, diamonds, and with rubies graced.

He's said to have a rich face and rubies about his
nose. *Dryden.*
Captain Jones.

RUBY, a precious stone, ranked by Jameson under the head of the spinell, of the color of a bright corn poppy flower. The balass, or pale red inclining to violet; a species of sapphire. There are rubies of different shades of color, but that the most sought after should be scarlet, or fire color; it should be soft and velvety in appearance, and throw forth a glow lively and ardent. When these qualities are eminently displayed, no stone is comparable thereto, and its value surpasses even that of the diamond. The spinell rubies are about half the value of diamonds of the same weight; the balass is valued at 30s. per carat; a perfect ruby, if it weigh more than three carats and a half, is of greater value than a diamond of the same weight. It is most frequently found very small; its common size being that of a large pin-head; and is then very cheap; but it is also found of four, six, or ten carats; and sometimes, though but very rarely, up to twenty, thirty, or forty. It is never found of an angular or crystalliform shape, but always of a pebble-like figure, often roundish, sometimes oblong, and much larger at one end than the other, and resembling a pear, usually more or less flattened on one side. It is commonly so naturally bright and pure on the surface as to need no polishing; it is worn in rings, and in the crowns of princes, in its native state. It is fusible with borax in a strong and long-continued heat, running into a transparent glass of a pale green color: the same effect is produced by microcosmic salt; but with potassa the glass is opaque and differently colored. In the course of experiments made on precious stones, by order of the grand duke of Tuscany, rubies, in the heat which dissipated diamonds, were softened, and lost some of their color, but preserved their form and weight. By addition of a third lens, a further degree of fusion was

given to rubies. Even then rubies could not be made to unite with glass. By having been exposed to this heat, the surface of the rubies which had suffered fusion lost much of their original hardness, and were nearly as soft as crystal. But their internal parts, which had not been fused, retained their hardness. Rubies become electric by being rubbed. They are met with in the mountains of Pegu in the East Indies; and at Ava, Calicut, and Brasil. They are found in the sands of rivers, in an argillaceous earth of a hard texture and greenish color; sometimes they adhere to red rocks. The spinell rubies are met with in Hungary, Silesia, Bohemia, and Brasil. The balass comes principally from Brasil, though some are also brought from the East Indies. The largest ruby known was brought from China to prince Gargarin, governor of Siberia. It came afterwards into the hands of prince Mentchikof, and is at present one of the ornaments of the imperial crown of Russia. According to Pliny, the ancients found considerable difficulty in engraving on this stone: many modern artists have essayed upon it, and among them one of the most successful is a German named Häfler.

RUD, *v. a.* Sax. *ruðu*, redness. To make red. Obsolete.

Her cheeks, like apples, which the sun had rud-
ded. *Spenser.*

RUDBECK (Olaus), a learned Swedish physician, of an ancient and noble family, born in 1630. He became professor of medicine at Upsal, where he acquired great applause by his extensive knowledge; and died in 1702. His principal works are, 1. *Exercitatio Anatomica, exhibens ductus novos hepaticos Aqueos, et vasa glandularum serosa*, in 4to. He there claims the discovery of the lymphatic vessels. 2. *Athlantica, sive Manheim, vera Japheti posterorum sedes ac patria*, 3 vols. folio; in which he endeavours to prove that Sweden was the country whence all the ancient Pagan divinities and our first parents were derived; and that the Germans, English, French, Danes, Greeks, and Romans, with all other nations, originally came from thence.

RUDBECKIA, in botany, dwarf sunflower, a genus of the polygamia frustranea order, and syngenesia class of plants; natural order forty-ninth, composita; receptacle paleaceous and conical; pappus consisting of a quadridentate margin: CAL. a double series of scaly leaves. Species nine, natives of America.

RUDDER, *n. s.* Sax. *poŕep*; Belg. *roeder*. The instrument of steering a vessel; any thing that guides or governs.

They loosed the rudder bands, and hoisted up the main-sail, and made towards shore. *Acts xxvii. 40.*

My heart was to thy rudder tied by the string,
And thou shouldst tow me after. *Shakspeare.*

Those that attribute unto the faculty any first or sole power have therein no other understanding, than such a one hath, who, looking into the stern of a ship, and finding it guided by the helm and rudder, doth ascribe some absolute virtue to the piece of wood, without all consideration of the hand that guides it. *Raleigh's History of the World.*

For rhyme the rudder is of verses. *Hudibras*.
Thou held'st the rudder with a steady hand,
Till safely on the shore the bark did land. *Dryden*.

The RUDDER, in navigation, is a piece of timber turning on hinges in the stern of the ship, and which, opposing sometimes one side in the water and sometimes another, turns or directs the vessel this way or that. See HELM, and SHIP BUILDING.

RUDDIMAN (Thomas), M. A., the grammarian of Scotland, was born in 1674, at Raggel, in Banff. His father, James Ruddiman, was a farmer, and strongly attached to the house of Stuart. His son was instructed in the principles of Latin grammar at the parish school of Boyn-die. At the age of sixteen he became anxious to pursue his studies at the university; but his father, thinking him too young, opposed his inclination. Hearing of the competition trial annually held at King's College, Aberdeen, for a certain number of bursaries, Ruddiman, without the knowledge of his father, set out for that city, where he presented himself as a candidate, and, though he had neither clothes to give him a decent appearance, nor friends to recommend him, he gained the first prize. After attending the university four years he obtained the degree of M. A. He soon after engaged as a private tutor; and within a year accepted the office of school-master of Laurencekirk. When Ruddiman had spent three years and a half in this employment, Dr. Pitcairne invited him to Edinburgh, and promised him his patronage. When Ruddiman arrived in Edinburgh, the advocates' library, which had been founded eighteen years before by Sir George Mackenzie, attracted his attention; and he was soon after appointed assistant keeper, under Mr. Spottiswoode the librarian. His salary for executing this laborious office was £8 6s. 1d.; and he received a present of £5 Scots, £4 3s. 4d. sterling, as a mark of respect from the faculty! When Ruddiman's merit became better known his assistance was anxiously solicited by those engaged in literary publications. Freebairne, a respectable bookseller of that period, prevailed upon him to correct and prepare for the press Sir Robert Sibbald's *Introductio ad historiam rerum à Romanis gestarum in ea Borealis Britanniae parte quæ ultra murum Picticum est*. He received for his labor £3 sterling. At the request of Mr. Spottiswoode, librarian, for £5 sterling, he contributed his aid to the publication of Sir Robert Spottiswoode's *Præctiques of the Laws of Scotland*. In 1707 he commenced auctioneer, an employment not very suitable to the dignified character of a man of letters; and published an edition of Voluseni de Animi Tranquillitate Dialogus, to which he prefixed the life of Volusenus. In 1709 he published Johnstoni Cantici Solomonis Paraphrasis Poetica, and Johnstoni Cantica with notes, which he dedicated in Latin verse to Dr. Pitcairne. The philological talents of Ruddiman were next directed to a more important object. Freebairne proposed to publish a new edition of the Scottish translation of Virgil's *Æneid* by Gawin Douglas, bishop of Dunkeld. Ruddiman corrected the work and wrote the glossary. Ruddiman was now invited by the magistrates of Dundee to be

rector of the grammar school of that town; but the faculty of advocates, anxious to retain him, augmented his salary to £30 6s. 8d. sterling, and he declined the offer. In 1711 he assisted bishop Sage in publishing Drummond of Hawthornden's Works. In 1713 Dr. Pitcairne died, and Ruddiman conducted the sale of his library, which was disposed of to Peter the Great. In 1714 he published the *Rudiments of the Latin Tongue*, which soon superseded all other books on the subject, and is still taught in all the grammar-schools in Scotland. It has also been translated into other languages. He was next called upon to publish the works of Buchanan. The value of these he enhanced much by his elaborate preface, his *Tabula Regum Scotiæ Chronologica*, and *Proprium Nominum Interpretatio*. Ruddiman also added a learned dissertation, entitled *De Metris Buchananæ Libellus*, and subjoined annotations, critical and political, on the *History of Scotland*. He had now been so long accustomed to superintend the press that he was led to erect a printing-office himself. In 1715 he commenced printer, in partnership with his brother Walter, who had been brought up to the business. Some years after he was appointed printer to the university, with James Davidson, bookseller. In 1725 the first part of his *Grammaticæ Latinæ Institutiones* was published. The second part appeared in 1731. Ruddiman next engaged in the management of a newspaper, the *Caledonian Mercury*. Mr. Ruddiman, after the death of Mr. Spottiswoode, librarian, remained for some time in his former station; but was at length appointed keeper of the library, though without any increase of salary. In 1739 he published *Selectus Diplomatum et Numismatum Scotiæ Thesaurus*. This work was projected and begun by Anderson (hence called Anderson's *Diplomata*), but was finished by Ruddiman. As Ruddiman had imbibed from his father his political prejudices in favor of the house of Stuart, he was not an unconcerned spectator of the civil commotions in 1745. He did not, however, take any active part in the Rebellion. He retired to the country; and was engaged in writing *Critical Observations on Burman's Commentaries on Lucan's Pharsalia*. During the last seventeen years of his life Ruddiman was almost incessantly engaged in controversy. He died in Edinburgh on the 12th January, 1757, in his eighty-third year. He was three times married, but left behind him only one daughter, Alison, who was married, in 1747, to James Stewart, esq.

RUD'DLE, *n. s.* *Isl. rudul.* Red earth.

Ruddle owes its color to an admixture of iron; and, as that is in greater or less proportion, it is of a greater or less specific gravity, consistence, or hardness.

Woodward.

RUD'DOCK, *n. s.* *Lat. rubecula.* A kind of bird. The red-breast.

Of singing birds, they have linnets and ruddocks.
Carew.

RUDDY, *adj.* *Sax. ruðu.* Approaching to redness; pale red.

The ruddiness upon her lip is wet;
You'll mar it, if you kiss it. *Shakspeare.*

We may see the old man in a morning,
Lusty as health, come ruddy to the field,

And there pursue the chase, as if he meant
To o'ertake time, and bring back youth again.

Otway.

New leaves on every bough were seen ;
Some *ruddy* coloured, some of lighter green.

Dryden.

A crown of *ruddy* gold enclosed her brow,
Plain without pomp.

Id.

Ceres, in her prime,
Seems fertile, and with *ruddiest* freight bedeckt.

Philips.

If the flesh lose its *ruddiness*, and look pale and
withered, you may suspect it corrupting.

Wiseman's Surgery.

If physis, or issues, will keep the complexion from
melting to coarse, or *ruddy*, she thinks them well
employed.

Law.

RUDE, *adj.* } Sax. *peðe* ; Fr. *rude* ;
RUDELY, *adv.* } Ital. *rudo* ; Lat. *rudis*. Un-
RUDENESS, *n. s.* } taught ; barbarous ; rough ;
harsh : the adverb and noun substantive corre-
sponding.

Though I be *rude* in speech, yet not in knowledge.
2 Corinthians.

I would know what ancient ground of authority he
hath for such a senseless fable ; and if he have any
of the *rude* Irish books.

Spenser.

With his truncheon he so *rudely* stroke
Cynocles twice, that twice him forced his foot re-
voke.

Id.

Let be thy bitter scorn,
And leave the *rudeness* of that antique age
To them that lived therein in state forlorn.

Id.

Ruffian let go that *rude* uncivil touch ;
Thou friend of an ill-fashion.

Shakspeare.

I that am not shaped for sportive tricks,
I that am *rudely* stamp'd, and want love's majesty
To strut before a wanton ambling nymph.

Id.

This *rudeness* is a sauce to his good wit,
Which gives men stomach to digest his words
With better appetite.

Id. Julius Cæsar.

Vane's bold answers, termed *rude* and ruffian-
like, furthered his condemnation.

Hayward.

What he did amiss was rather through *rudeness*
and want of judgment, than any malicious meaning.

Id.

In their so *rude* atode,
Not the poore swincherd would forget the gods.

Chapman.

He was yet but *rude* in the profession of arms,
though greedy of honour.

Wotton's Buckingham.

Nor is there any nation in the world, now ac-
counted civil, but, within the memory of books, were
utterly *rude* and barbarous.

Wilkins.

Clouds pushed with wings *rude* in their shock.

Milton.

Such tools as art yet *rude* hath formed.
Spring does to flowery meadows bring,

Id.

What the *rude* winter from them tore.

Waller.

You can with single look inflame
The coldest breast, the *rudest* tame.

Id.

The water appears white near the shore, and a
ship : because the rude agitation breaks it into foam.

Boyle.

It was the custom to worship *rude* and unpolished
stones.

Stillingfleet.

To his country farm the fool confined ;

Rude work well suited with a rustic mind.

Dryden.

My muse, though *rudely*, has resigned

Some faint resemblance of his godlike mind.

Id.

The public love in triumphs *rudely* share,

And kings the *rudeness* of their joy must bear.

Id.

It has been so usual to write prefaces, that a man
is thought *rude* to his reader who does not give him
some account beforehand.

Walsh.

You can hardly be too sparing of water to your
housed plants ; the not observing of this destroys
more plants than all the *rudenesses* of the season.

Evelyn's Kalender.

The *rudeness*, tyranny, the oppression and ingra-
titude of the late favorites towards their mistress,
were no longer to be born.

Swift.

The *rudeness*, ill-nature, or perverse behaviour of
any of his flock, used at first to betray him into im-
patience ; but it now raises no other passion in him
than a desire of being upon his knees in prayer to
God for them.

Law.

To win no praise when well-wrought plans pre-
vail,

But to be *rudely* censured when they fail ;

To doubt the love his favorites may pretend,

And in reality to find no friend.

Cowper.

RUDENSBY, *n. s.* From *rude*. An uncivil
turbulent fellow. A low and deservedly obso-
lete word.

I must be forced

To give my hand, opposed against my heart,
Unto a mad-brain *rudesby*, full of spleen.

Shakspeare.

Out of my sight, *rudesby*, be gone.

Id.

RUDIMENT, *n. s.* } Fr. *rudiment* ; Lat.

RUDIMENTAL, *adj.* } *rudimentum*. The first
principles ; first elements of a science ; beginning
of any thing : the adjective corresponding.

Such as were trained up in the *rudiments*, and were
so made fit to be by baptism received into the church,
the fathers usually term hearers.

Hooker.

To learn the order of my fingering,

I must begin with *rudiments* of art.

Shakspeare.

Moss is but the *rudiment* of a plant, and the mould
of earth or bark.

Bacon's Natural History.

He was nurtured where he was born in his first
rudiments, till the years of ten, and then taught the
principles of music.

Wotton's Life of Villiers.

Thou soon shalt quit

Those *rudiments*, and see before thine eyes

The monarchies of the' earth, their pomp, and state,

Sufficient introduction to inform

Thee, of thyself so apt, in regal arts.

Milton.

The *rudiments* of nature are very unlike the grosser
appearances.

Glanville's Scepis.

So looks our monarch on this early light,

The' essay and *rudiments* of great success,

Which all-maturing time must bring to light.

Dryden.

Could it be believed that a child should be forced
to learn the *rudiments* of a language which he is
never to use, and neglect the writing a good hand,
and casting accounts?

Locke.

The sappy boughs

Attire themselves with blossoms, sweet *rudiments*

Of future harvest.

Philips.

Shall that man pretend to religious attainments
who is defective and short in moral ? which are but
the *rudiments*, the beginnings, and first draught of
religion ; as religion is the perfection, refinement,
and sublimation of morality.

South.

God beholds the first imperfect *rudiments* of virtue
in the soul, and keeps a watchful eye over it, till it
has received every grace it is capable of.

Addison's Spectator.

Your first *rudimental* essays in spectatorship were
made in my shop, where you often practised for hours.

Spectator.

O come not ye near innocence and truth,

Ye worms that eat into the bud of youth !

Infectious as impure, your blighting power

Taints in its *rudiments* the promised flower.

Cowper.

Such as the halteres, or rudiments of wings, of some two-winged insects. *Darwin.*

RUE, *v. a.*

RUEFUL, *adj.*

RUEFULLY, *adv.*

RUEFULNESS, *n. s.*

Thou temptest me in vain ;
To tempt the thing which daily yet I rue,
And the old cause of my continued pain,
With like attempts to like end to renew. *Spenser.*

You'll rue the time

That clogs me with this answer. *Shakspeare.*

When we have our armour buckled on,
The venom'd vengeance ride upon our swords,
Spur them to rueful work, rein them from ruth. *Id.*
Oh ! treacherous was that breast to whom you
Didst trust our counsels, and we both may rue
Having his falsehood found too late, 'twas he
That made me cast you guilty, and you me. *Donne.*

Thy will

Chose freely what it now so justly rues. *Milton.*
Cocytus, named of lamentation loud,
Heard on the rueful stream. *Id. Paradise Lost.*
Why should an ape run away from a snail, and
very ruefully and frightfully look back, as being
afraid ? *More.*

He sighed, and cast a rueful eye ;
Our pity kindles, and our passions die. *Dryden.*
I gaed a waefu' gate yestreen,
A gate, I fear, I'll dearly rue ;
I gat my death frae twa sweet een,
Twa lovely een o' bonnie blue. *Burns.*

RUE, *n. s.* Fr. *rue* ; Lat. *ruta*. A herb, formerly called herb of grace, because holy water was sprinkled with it.

What savor is better,
For places infected, than wormwood and rue ? *Tusser.*

Here did she drop a tear ; here, in this place,
I'll set a bank of rue, sour herb of grace ;
Rue, even for Ruth, here shortly shall be seen,
In the remembrance of a weeping queen. *Shakspeare. Richard II.*

The weasel, to encounter the serpent, arms herself
with eating of rue. *More.*

RUE, in botany. See RUTA.

RUE DOG'S. See SCROPHULARIA.

RUE (Charles de la), a French orator and poet, born in Paris in 1643. He was educated at the college of the Jesuits, where he became a professor of humanity and rhetoric. In 1667 he composed a Latin poem on the conquests of Louis XIV., which was so much esteemed by Corneille that he translated it into French, presented it to the king, and passed such high encomiums on the superior merit of the original that the author was received into the favor of that monarch. De la Rue became one of the most eminent preachers of his age. He died in Paris on the 27th of May, 1725, aged eighty-two. He published Panegyrics, Funeral Orations, and Sermons. His best sermon is entitled Des Calamities Publiques, and his most admired funeral oration was composed on the prince of Luxemburg. There are also tragedies of his writing, both in Latin and French, which were approved by Corneille. He was one of those learned men who published editions of the classics for the use of the Dauphin. Virgil, which fell to his share, was published with notes, and a life of the poet, in 1675, 4to.

RUELLE', *n. s.* Fr. *ruelle*. A circle ; an assembly at a private house. Not used.

The poet, who flourished in the scene, is condemned in the *ruelle*. *Dryden's Preface to Æneis.*

RUELLIA, in botany, a genus of the angiospermia order, and didynamia class of plants ; natural order fortieth, personate : CAL. quinquepartite : COR. sub-campanulated ; the stamina approaching together in pairs : CAPS. springing asunder by means of its elastic segments. Species forty-six ; shrubs of Asia, Africa, and America.

RUFF, *n. s.*

RUFFLE, *v. a., v. n. & n. s.* } Both from rough.
ornament for the neck or wrists : to wrinkle ; disorder ; roughen ; discompose ; to grow rough or turbulent : disturbance : ruff is also a river fish.

We'll revel it

With ruffs, and cuffs, and fardingals. *Shakspeare.*

Naughty lady,

These hairs, which thou dost ravish from my chin,
Will quicken and accuse thee : I'm your host ;
With robbers' hands, my hospitable favours
You should not ruffle thus. *Id.*

Were I Brutus,

And Brutus Antony, there were an Antony
Would ruffle up your spirits, and put a tongue
In every wound of Cæsar, that should move
The stones of Rome to rise and mutiny. *Id.*

The night comes on, and the high winds

Do sorely ruffle ; for many miles about
There's scarce a bush. *Id.*

A valiant son-in-law thou shalt enjoy ;

One fit to bandy with thy lawless sons,
To ruffle in the commonwealth of Rome. *Id.*

They would ruffle with jurors, and enforce them to
find as they would direct. *Bacon's Henry VII.*

Like an uproar in the town,

Before them every thing went down,
Some tore a ruff, and some a gown. *Drayton.*

Sooner may a gulling weather spy,
By drawing forth heaven's scheme, tell certainly,
What fashioned hats, or ruffs, or suits next year,
Our giddy-headed antick youth will wear. *Donne.*

Within a thicket I reposed, when round

I ruffled up fallen leaves in heap, and found,
Let fall from heaven, a sleep interminate. *Chapman.*

The knight found out

The' advantage of the ground, where best
He might the ruffled foe infest. *Hudibras.*

We are transported by passions, and our minds
ruffled by the disorders of the body ; nor yet can we
tell how the soul should be affected by such kind of
agitations. *Glanville.*

A ruff or pope is much like the pearch for shape,
and taken to be better ; but will not grow bigger than
a gudgeon : he is an excellent fish, and of a pleasant
taste. *Waltom.*

In changeable taffeties, differing colours emerge
and vanish upon the ruffling of the same piece of silk.
Boyle.

As she first began to rise,
She smoothed the ruffled seas, and cleared the skies.
Dryden.

The rising winds a ruffling gale afford. *Id.*

The fiery courser, when he hears from far
The sprightly trumpets and the shouts of war,
On his right shoulder his thick mane reclined,
Ruffles at speed, and dances in the wind. *Id.*

How many princes that, in the ruff of all their

glory, have been taken down from the head of a conquering army to the wheel of the victor's chariot!

L'Estrange.

The ladies freed the neck from those yokes, those linen *ruffs*, in which the simplicity of their grandmothers had enclosed it.

Addison's Guardian.

A small skirt of fine *ruffled* linen, running along the upper part of the stays before, is called the modesty-piece.

Addison.

The tucker is a slip of fine linen, run in a small *ruffle* round the uppermost verge of the women's stays.

Id.

I reared this flower,

Soft on the paper *ruff* its leaves I spread. *Pope.*

Bear me, some god! oh quickly bear me hence

To wholesome solitude, the nurse of sense;

Where contemplation prunes her *ruffled* wings,

And the free soul looks down to pity kings. *Id.*

Conceive the mind's perception of some object, and the consequent *ruffle* or commotion of the blood.

Watts.

RUFFHEAD (Dr. Owen), was the son of a baker in Piccadilly, who educated him for the law. He entered in the Middle Temple; and, while he was waiting for opportunities to distinguish himself in his profession, he wrote a variety of pamphlets on temporary politics; and was afterwards distinguished by his accurate edition of *The Statutes at Large*, in 4to. He now obtained good business, though more as a chamber counsellor in framing bills for parliament than as a pleader; but his close application to study, with the variety of works he engaged in as an author, impaired his constitution. He died in 1769, aged forty-six. Some time before his death bishop Warburton engaged him to write his long promised *Life of Alexander Pope*; which, however, when executed, was very far from giving general satisfaction.

RUFFIAN, *n. s. & v. n.* Teut. *ruffian*; Ital. *ruffiano*; Fr. *ruffien*, a bawd. Perhaps, says Dr. Johnson, it may be best derived from the old Teutonic word which we now write rough. A brutal, boisterous fellow; a cut-throat; a robber: to play the ruffian.

Have you a *ruffian* that will swear? drink? dance? Reveal the night? rob? murder? *Shakspeare.*

A fuller blast ne'er shook our battlements;

If it hath *ruffianed* so upon the sea,

What ribs of oak when mountains melt on them,

Can hold the mortise? *Id. Othello.*

Sir Ralph Vane's bold answers, termed rude and *ruffian*-like, falling into ears apt to take offence, furthered his condemnation. *Hayward.*

The boasted ancestors of these great men, Whose virtues you admire, were all such *ruffians*; This dread of nations, this almighty Rome, That comprehends in her wide empire's bounds All under heaven, was founded on a rape.

Addison's Cato.

Experienced age

May timely intercept the *ruffian* rage;

Convene the tribes. *Pope's Odyssey.*

RUFINUS, a celebrated Italian, born about the middle of the fourth century at Concordia. He applied himself to the belles lettres, and studied eloquence at Aquileia. He then devoted himself to theology. St. Jerome happening to pass through Aquileia, Rufinus formed an intimate friendship with him; but was soon deprived of his company, as he continued his travels through France and Germany, and then

set out for the east. Rufinus resolved to follow him; embarked for Egypt; and, having visited the hermits in the deserts, repaired to Alexandria to hear the renowned Didymus. The Arians, who ruled in the reign of Valens, persecuted Rufinus; threw him into a dungeon, loaded him with chains, and, finally, banished him to the deserts of Palestine. From this exile he was relieved by St. Melania, who employed her wealth in ransoming those confessors who had been imprisoned or banished. He went next to Jerusalem; and having built a monastery on Mount Olivet he there assembled a great number of hermits. He converted many to the Christian faith, and persuaded above 400 hermits who had joined in the schism of Antioch to return to the Catholic church. Rufinus, having published a translation of the principles of Origen, was summoned to appear before pope Anastasius, at Rome. But he sent an apology for not appearing, with a vindication of his work, in which he attempted to prove that certain errors, of which Origen had been accused, were consistent with the opinions of the orthodox. St. Jerome attacked Rufinus's translation. Rufinus composed an elegant reply, in which he said that, being only the translator of Origen, he was not bound to sanction his errors. In 407 he returned to Rome; but in 408, that city being threatened by Alarie, he retired to Sicily, where he died in 410. His works are, 1. A Translation of Josephus. 2. A Translation of several works of Origen. 3. A Latin Version of Ten Discourses of Gregory Nazianzen, and Eight of Basil. 4. A Translation of the Ecclesiastical History of Eusebius, which engaged him nearly ten years. He made many additions to the work, and continued the history from the twentieth year of Constantine to the death of Theodosius the Great. 5. A Vindication of Origen. 6. Two Apologies, addressed to St. Jerome. 7. Commentaries on the prophets Hosea, Joel, and Amos. 8. Lives of the Hermits. 9. An Explanation of the Creed.

RUFUS, the surname of William II. king of England. See **ENGLAND**.

RUG, *n. s.* Swed. *rugget*, rough. A rough, nappy, woollen cloth: a rough dog.

Mongrels, spaniels, curs, Shoughes, water rugs, and demy wolves are cleped All by the name of dogs. *Shakspeare. Macbeth.*

January must be expressed with a horrid and fearful aspect, clad in Irish *rug* or coarse freeze.

Peacham on Drawing.

The vungus resembleth a goat, but greater and more profitable; of the fleece whereof they make *rugs*, coverings, and stuffs. *Heylin.*

A *rug* was o'er his shoulders thrown;

A *rug*; for nightgown he had none. *Swift.*

RUGBY, a market town and parish of Warwickshire, eighty-five miles from London, is pleasantly situated near the Avon. Rugby is chiefly remarkable for its celebrated grammar-school, founded in 1567. The church is a commodious structure, and there are places of worship for dissenters. Market on Saturday; there are also some annual fairs.

RUGEN, an island of the Baltic, separated from Pomerania by the strait of Gellen. Its shape is so very irregular that no determinate

length or breadth would give any idea of its size, but it is calculated to contain 142,000 acres. It consists of the island Proper and three peninsulas, Jasmund on the north-east, Wittow on the north, and Monguth on the south-east. These different parts have several elevations, called mountains by the natives. The peninsula of Jasmund is terminated by a promontory of chalky cliffs, resembling the ruins of an immense building, interspersed with trees, and from which a torrent tumbles with impetuosity into the sea, above which the highest part of the promontory is 430 feet. The peninsula of Wittow also terminates in a similar but less elevated promontory, named Arcona. Chalk predominates in these two peninsulas; the general soil of the other parts is sand and clay mixed with shells; blocks of granite are also met with, and the north coast, in particular, is covered with pyrites, fragments of coral and jasper, and porphyry. It also affords china earth and clays for pottery.

The island is well watered by lakes and rivulets, and produces all kinds of grain and vegetables in the greatest abundance. It has good horses and excellent horned cattle, but the sheep are inferior. The wild animals are deer, hares, and foxes. The Rugeners breed great quantities of geese, which they smoke for exportation. In the middle of the peninsula of Jasmund, 400 feet above the sea, is a large lake, near which are several ancient mounds and ramparts of earth, supposed by the natives to be the burying places of the Huns, a number of earthen vases being found in the mounds. These mounds, of which there are others in various parts of the island, are called Hunengræbre, which properly signifies giant's grave: they are usually between forty and sixty feet long. Rudely cut large square stones are also met with in several parts of the island, which are supposed to have served as altars. The Rugeners are extremely industrious, the produce of the soil, their cattle, geese, and the herring fishery, supplying them with objects of foreign commerce, and which they export from some roads (the island having no port), and particularly from the village of Schaprode on the west. The annual export of corn from the island is 1600 lasts. The island has two towns and several villages. Bergen, the chief place, is near the north-east part of the island of Rugen Proper, and situated on an eminence that commands a view of the greater part of the island. It has from 1500 to 1600 inhabitants. Saagard, the second town, is on the interior of the peninsula of Jasmund, has 800 inhabitants, and near it is a mineral spring, resorted to both by the natives and strangers. The population of the island is 25,000.

Rugen belonged to Denmark from the twelfth to the fourteenth century, when it passed by convention to the dukes of Pomerania, whose house becoming extinct, Sweden got possession of its territories by the peace of Westphalia, in 1648, when Rugen was erected into a principality, to which was attached the office of grand huntsman of the empire. The language of the inhabitants is German, with a partial mixture of Swedish and Danish, and the manners and usages are the same as those of the north of

Germany. The peasants, however, were not emancipated from a state of vassalage till 1806. This island was acquired by Prussia, with the rest of Pomerania, in 1814. The neighbouring parts of the continent being a monotonous level, the island of Rugen is visited for its picturesque beauties by many Germans, one of whom has elegantly celebrated the promontory of Arcona, the rocks of Jasmund, and its sacred woods and tumuli. The coasts are celebrated in the annals of shipwreck, scarcely a year passing without several vessels being stranded on the shores of the peninsulas and on Hidensee. Several ancient regulations are still in force respecting shipwrecks. When a vessel makes the signal of distress, the inhabitants of the coast are bound to hasten to her assistance, and first to endeavour to save the crew. The persons who arrive first are entitled to a preference for salvage, but none is to enforce his services if the crew is alone able to save the cargo. The small islands dependent on Rugen are numerous; the principal is Hidensee on the west, whose inhabitants have little external communications; they speak a rude dialect of the high German, mixed with many Danish, Swedish, and obsolete Teutonic words. Their occupations are rearing a few cattle, whose dung is their principal fuel, the island having no wood; fishing for their subsistence, and collecting the amber which is occasionally driven on the shores. Unmantz island, also on the west, is next in consideration; and all the others, amounting to upwards of a dozen, are insignificant.

RUG'GED, *adj.* Swed. *rugget*. Rough; full of unevenness or asperity.

His hair is sticking;
His well-proportioned beard made rough and *rugged*
Like to the summer's corn by tempest lodged.

Shakspeare.

Now bind my brows with iron, and approach
The *rugged*'st hour that time and spite dare bring,
To frown upon the enraged Northumberland. *Id.*

Hardness and *ruggedness* is unpleasant to the touch.
Bacon.

Through forests wild,
To chase the lion, boar, or *rugged* bear. *Fairfax.*
Nature, like a weak and weary traveller,
Tired with a tedious and *rugged* way. *Denham.*

Fierce Talgol, gathering might,
With *rugged* truncheon charged the knight.

Hudibras.

Syrups immediately abate and demulce the hoarseness and violence of a cough, by mollifying the *ruggedness* of the intern tunick of the gullet.

Harvey.

A monosyllable line turns verse to prose, and even that prose is *rugged* and unharmonious.

Dryden.

This softness of the foot, which yields and fits itself to the *ruggedness* and unevenness of the roads, does render it less capable of being worn. *Ray.*

The greatest favours to such a one neither soften nor win upon him; neither melt nor endear him, but leave him as hard, *rugged*, and unconcerned as ever.

South.

Since the earth revolves not upon a material and *rugged*, but a geometrical plane, their proportions may be varied in innumerable degrees. *Bentley.*

RUGENDAS (George Philip), a celebrated painter, born at Augsburg, in 1666. He excelled

in painting sieges, battles, &c., though he painted with the left hand. He died 1742.

RUGGLES (George), M. A., a dramatic writer, who flourished in the reign of king James I. He wrote a humorous Latin play, entitled *Ignoramus*, which was acted before the king on the 8th of March, 1615, at the university of Cambridge.

RUGIN, *n. s.* From *RUG*. A nappy cloth. The lips grew so painful that she could not endure the wiping the ichor from it with a soft *rugin* with her own hand. *Wiseman's Surgery.*

RUGINE, *n. s.* Fr. *rugine*. A chirurgéon's rasp.

If new flesh should not generate, bore little orifices into the bone, or rasp it with the *rugine*. *Sharp.*

RUGOSE, *adj.* Lat. *rugosus*. Full of wrinkles.

It is a relaxation of the sphincter to such a degree that the internal *rugose* coat of the intestine turneth out, and beareth down. *Wiseman's Surgery.*

RUIN, *n. s., v. a., & v. n.* Fr. *ruine*; Lat. *RUINATE*, *v. a.* *ruina*. The fall

RUINATION, *n. s.* or destruction of

RUINER, edifices; the re-

RUINOUS, *adj.* mains of such edi-

RUINOUSLY, *adv.* fices; destruction;

mischief: to ruin and ruinate (the latter disused) both mean to subvert; destroy: ruin, verb neuter, to fall into destruction: the other derivatives correspond in sense.

Though he his house of polished marble build,
Yet shall it *ruin* like the moth's frail cell,
Or sheds of reeds, which summer's heat repel. *Sandys.*

So shall the great revenger *ruinate*
Him and his issue by a dreadful fate. *Id.*

He parted frowning from me, as if *ruin*
Leant from his eyes. *Shakspeare. Henry VIII.*

Roman coins were overcovered in the ground, in the sudden *ruination* of towns by the Saxons. *Camden's Remains.*

The errors of young men are the *ruin* of business. *Bacon.*

The Romans came to pull down kingdoms; Philip and Nabis were already *ruinated*, and now was his turn to be assailed. *Id.*

It is less dangerous, when divers parts of a tower are decayed, and the foundation firm, than when the foundation is *ruinous*. *Hayward.*

What offence of such impietie
Hath Priam or his sonnes done thee? that with so
high a hate

Thou shouldst thus ceaselessly desire to raze and
ruinate

So well a builded town as Troy? *Chapman.*

This Ulysses, old Laertes' sonne,
That dwells in Ithaca; and name hath wonne
Of citie *ruiner*. *Id.*

If real uneasinesses may be admitted to be as de-
terring as imaginary ones, his own decree will retort
the most *ruinously* on himself. *Decay of Piety.*

Havock, and soil, and *ruin* are my gain. *Milton.*

Hell heard the unsufferable noise; hell saw
Heaven *ruining* from heaven, and would have fled
Affrighted, but strict fate had fixed too deep

Her dark foundations, and too fast had bound. *Id.*

The birds,
After a night of storm so *ruinous*,
Cleared up their choicest notes in bush and spray,
To gratulate the sweet return of morn. *Id.*

Loud rung the *ruin*, and, with boistrous fear,
Straits revelled in the queen's amazed ear. *Beaumont.*

Those whom God to *ruin* has designed,
He fits their fate, and first destroys their mind. *Dryden.*

A nation loving gold must rule this place,
Our temples *ruin*, and our rites deface. *Id.*

If we are idle, and disturb the industrious in their
business, we shall *ruin* the faster. *Locke.*

The Veian and the Gabian towers shall fall,
And one promiscuous *ruin* cover all;

Nor, after length of years, a stone betray
The place where once the very *ruins* lay. *Addison.*

She would *ruin* me in silks, were not the quantity
that goes to a large pincushion sufficient to make her
a gown and petticoat. *Id.*

Judah shall fall oppressed by grief and shame,
And men shall from her *ruins* know her fame. *Prior.*

Those successes are more glorious which bring be-
ne to the world, than such *ruinous* ones as are
dyed in human blood. *Granville's Preface.*

A confident dependence ill grounded creates such
a negligence as will certainly *ruin* us in the end. *Wake.*

Such a fool was never found,
Who pulled a palace to the ground,
Only to have the *ruins* made

Materials for a house decayed. *Sieiff.*

A stop might be put to that *ruinous* practice of
gaming. *Id.*

RUINART (Thierry, or Theodoric), a learned
French divine, born at Rheims in 1657. He
became a Benedictine monk in 1674. Mabillon
chose him for his assistant in his literary labors.

In 1689 he published *Acta Primorum Martyrum*
Sincera, &c., 4to. He also published several
other learned works. When Mabillon died, in
1707, he was appointed to continue his work;

but died in travelling to Champagne, in quest of
new memoirs, in 1709.

RUZIA, in botany, a genus of the polyandria
order, and monadelphia class of plants; natural
order thirty-seventh, columnifere: *CAL.* double;
external triphyllous; internal parted into five:
cor. consisting of five petals, inclining to the
right hand side, and adhering to the stamina,
which are from thirty to forty. It has ten styli,
and as many capsules. These are compressed
and membranous. In each capsule are two
seeds. There are four species, viz.—

1. *R. cordata*. 2. *R. laciniata*. 3. *R. lobata*;
and 4. *R. palmata*; all of which are natives
of Asia, and the Cape of Good Hope.

RULE, *n. s., v. a., & v. n.* Sax. *negole*; Teut.
RU'LER, *n. s.* [*v. n.* *regel*; Ital. *regola*;
regola; Span. *regla*; Lat. *regula*. Government;

sway; empire; any thing by which other things
are regulated; canon; precept; and, in an ob-

solete sense, regularity: as a verb active, to
control; govern; manage; or settle: as a verb
neuter to have power or command, taking over
before the object: a ruler is one who possesses
superior power or command: any instrument of
rule or guidance.

A wise servant shall have *rule* over a son that
causeth shame. *Proverbs xvii. 2.*

Judah yet *ruleth* with God, and is faithful with
the saints. *Hosea xi. 12.*

He sought to take unto him the *ruing* of the af-
fairs. *1 Mac.*

Soon rulers grow proud, and in their pride foolish.
Sidney.

I am ashamed, that women
Should seek for rule, supremacy, or sway,
When they are bound to serve, love, and obey.
Shakspeare.

Some say he's mad ; others, that lesser hate him,
Do call it valiant fury ; but, for certain,
He cannot buckle his distempered cause
Within the belt of rule.
Id.

It is a purposed thing
To curb the will of the nobility ;
Suffer't, and live with such as cannot rule,
Nor ever will be ruled.
Id. Coriolanus.

God, by his eternal providence, has ordained
kings ; and the law of nature, leaders and rulers
over others.
Raleigh.

Adam's sin did not deprive him of his rule, but
left the creatures to a reluctance.
Bacon.

How easily have these rulers discouraged a faint-
hearted people.
Bp. Hall's Contemplations.

If your influence be quite dammed up
With black usurping mists, some gentle taper,
Though a rush candle from the wicker hole
Of some clay habitation, visit us
With thy long levelled rule of streaming light.
Milton.

Thrice happy men ! whom God hath thus ad-
vanced !

Created in his image, there to dwell,
And worship him ; and in reward to rule
O'er his works.
Milton's Paradise Lost.

He laid this rule before him, which proved of
great use ; never to trouble himself with the fore-
sight of future events.
Fell.

We profess to have embraced a religion which
contains the most exact rules for the government of
our lives.
Tillotson.

Know'st with an equal hand to hold the scale ;
See'st where the reasons pinch, and where they fail,
And where exceptions o'er the general rule prevail.
Dryden.

Rome ! 'tis thine alone with awful sway,
To rule mankind, and make the world obey,
Disposing peace and war thy own majestic way.
Id.

There being no law of nature, nor positive law of
God, that determines which is the positive heir, the
right of succession, and consequently of bearing rule,
could not have been determined.
Locke.

We subdue and rule over all other creatures ; and
use for our own behoof those qualities wherein they
excel.
Ray.

They know how to draw a straight line between
two points by the side of a ruler.
Moxon.

A judicious artist will use his eye, but he will
trust only to his rule.
South's Sermons.

This makes them apprehensive of every tendency
to endanger that form of rule established by the law
of their country.
Addison.

The pompous mansion was designed
To please the mighty rulers of mankind ;
Inferior temples use on either hand.
Id.

Had he done it with the pope's license, his ad-
versaries must have been silent ; for that's a ruled case
with the schoolmen.
Atterbury.

Seven years the traitor rich Mycenæ swayed ;
And his stern rule the groaning land obeyed.
Pope.

Instruct me whence this uproar ;
And wherefore Vanoe, the sworn friend to Rome,
Should spurn against our rule and stir
The tributary provinces to war ?
A. Phillips's Briton.

A rule that relates even to the smallest oart of our
life is of great benefit to us, merely as it is a rule.
Law.

It was not easy to determine by what rule of dis-
tinction the words of this dictionary were to be
chosen.
Johnson. Plan of Dictionary.

B. I grant that men continuing what they are,
Fierce, avaricious, proud, there must be war ;
And never meant the rule should be applied
To him that fights with justice on his side.
Cowper.

RULE, in a monastic sense, a system of laws
or regulations, whereby religious houses are go-
verned, and which the religious make a vow at
their entrance to observe. Such are the rules of
the Augustins, Benedictins, Carthusians, Fran-
ciscans, &c.

RULES OF COURT, in law, are certain orders
made from time to time in the courts of law,
which attorneys are bound to observe, in order
to avoid confusion ; and both the plaintiff and
defendant are at their peril also bound to pay
obedience to rules made in court relating to the
cause depending between them. It is to be ob-
served that no court will make a rule for any
thing that may be done in the ordinary course ;
and that if a rule be made, grounded upon an
affidavit, the other side may move the court against
it, in order to vacate the same, and thereupon
shall bring into court a copy of the affidavit and
rule. On the breach and contempt of a rule of
court an attachment lies ; but it is not granted
for disobedience to a rule, when the party has not
been personally served ; nor for disobeying a
rule made by a judge in his chamber, which is
not of force to ground a motion upon, unless the
same be entered.

RUM, *n.s.* From the liquor ; often vulgarly
called kill-devil. A country parson. A cant
word, worthy the dean of St. Patrick's.

I'm grown a mere mopus ; no company comes,
But a rabble of tenants and rusty dull rums.
Swift.

RUM, a species of vinous spirit, distilled
from sugar-caues. Rum, according to Dr. Shaw,
differs from simple sugar spirit, in that it con-
tains more of the natural flavor or essential oil
of the sugar-cane ; a great deal of raw juice and
parts of the cane itself being fermented in the
liquor or solution of which the rum is prepared.
The unctuous or oily flavor of rum is often sup-
posed to proceed from the large quantity of fat
used in boiling the sugar ; which fat, indeed, if
coarse, will usually give a stinking flavor to the
spirit in our distillations of the sugar liquor or
wash, from our refining sugar-houses ; but this
is nothing of kin to the flavor of the rum, which
is really the effect of the natural flavor of the
cane. The method of making rum is this :—When
a sufficient stock of the materials is gathered to-
gether, they add water to them, and ferment
them in the common method, though the fer-
mentation is always carried on very slowly at
first ; because, at the beginning of the season for
making rum in the islands, they want yeast or
some other ferment to make it work ; but by de-
grees, after this, they procure a sufficient quan-
tity of the ferment, which rises up as a head to
the liquor in the operation ; and thus they are
able afterwards to ferment and make their rum
with a great deal of expedition, and in large
quantities. When the wash is fully fermented,
or to a due degree of acidity, the distillation is
carried on in the common way, and the spirit is

made up proof: though sometimes it is raised to a much greater strength, nearly approaching to that of alcohol or spirit of wine; and it is then called double distilled rum. It might be easy to rectify the spirit, and bring it to much greater purity than we usually find it to be of; for it brings over in the distillation a very large quantity of the oil; and this often so disagreeable that the rum must be suffered to lie by a long time to mellow before it can be used; whereas, if well rectified, it would grow mellow much sooner, and would have a much less potent flavor. The best state to keep rum in, both for exportation and other uses, is that of alcohol or rectified spirit. In this form it might be transported in one-half the bulk it usually is, and might be let down to the common proof strength with water when necessary: for the common use, of making punch, it would likewise serve much better in the state of alcohol; as the taste would be cleaner, and the strength might always be regulated to a much greater exactness than in the ordinary way. The only use to which it would not so well serve, in this state, would be the common practice of adulteration among our distillers; for, when they want to mix a large portion of cheaper spirit with the rum, their business is to have it of the proof strength, and as full of the flavoring oil as they can, that may drown the flavor of the spirits they mix with it, and extend its own. If the business of rectifying rum were more nicely managed, it seems a very practicable scheme to throw out so much of the oil as to have it in the fine light state of a clear spirit, but lightly impregnated with it: in this case it would very nearly resemble arrack, as is proved by the mixing a very small quantity of it with a tasteless spirit, in which case the whole bears a very near resemblance to arrack in flavor. Rum is usually very much adulterated in Britain: some are so barefaced as to do it with malt spirit; but, when it is done with molasses spirit, the tastes of both are so nearly allied that it is not easily discovered. The best method of judging of it is by setting fire to a little of it; and, when it has burnt away all the inflammable part, examining the phlegm both by the taste and smell.

RUM, an island of Scotland, one of the Hebrides, seven miles west of Eigg, and included in the county of Argyll. It is about eight miles long, and nearly as broad, containing a surface of above 22,000 square acres of hilly, rocky, and mountainous ground, chiefly fitted for pasture. Great numbers of small Shetland sheep are fed upon it, whose wool is remarkably fine. This island formerly abounded with wood and deer; but, the woods being destroyed, the deer have disappeared. The only harbour is Loch Serefort, which is spacious, and has good anchorage, from five to seven fathoms water.

RUM KEY, one of the Bahamas, situated about eight or nine leagues east from the north end of Long Island, and ten north from Great Harbour. It is under cultivation at present, and the acres of patented estates granted by the crown for this purpose, previously to May 1803, amounted to 11,738.

RUM RIVER, a river of North America, having

its source in Le Mille Lac, thirty-five miles south of Lower Red Cedar Lake, and falling into the Mississippi. It is about fifty yards wide at its mouth, and the small Indian canoes ascend quite to the lake.

RUM'BLE, *v. n.* Teut. *rummelen*; Belg. *rommelen*. To make a hoarse low noise.

At the rushing of his chariots, and at the *rumbling* of his wheels, the fathers shall not look back to their children for feebleness. *Jeremiah* xlvii. 3.

The trembling streams, which wont in channels clear

To *rumble* gently down with murmur soft,
And were by them right tuneful taught to bear
A base's part amongst their consorts oft,
Now forced to overflow with brackish tears,
With troublous noise did dull their dainty ears.

Spenser.

Rumble thy belly full; spit fire, spout rain;
Nor rain wind thunder are my daughters;
I tax not you, you elements, with unkindness.

Shakspeare.

Our courtier thinks that he's preferred whom every man envies;

When love so *rumbles* in his pate, no sleep comes in his eyes.

Suckling.

Apollo starts, and all Parnassus shakes
At the rude *rumbling* Baralippton makes.

Roscommon.

The fire she fanned, with greater fury burned
Rumbling within.

Dryden.

On a sudden there was heard a most dreadful *rumbling* noise within the entrails of the machine, after which the mountain burst.

Addison.

Several monarchs have acquainted me, how often they have been shook from their respective thrones by the *rumbling* of a wheel-barrow.

Spectator.

RUMELIA, or ROMELIA, a province of European Turkey, containing all the north parts of Greece and the capital of the Ottoman empire, Constantinople. It is one of the best peopled parts of Turkey: but so deficient are the Turks in statistical information, even in immediate reference to their own country, that the distribution of the inhabitants over its widely extended surface, and the comparative population of the different provinces, cannot be stated with precision. See TURKEY, for the best accounts we are able to obtain.

RUMEX, dock, in botany, a genus of the tri-gynia order, and hexandria class of plants; natural order twelfth, holoraceæ: CAL. triphyllous; there are three connivent petals, and one quetrous seed. There are thirty-seven species, of which the most remarkable are these:

1. *R. acutus*, or sharp pointed dock (the oxylapathum of the shops). The roots of this are slender, and run straight down, sending out a few small fibres; the stalks rise about two feet high, garnished at bottom with leaves four inches long, and one and a half broad in the middle. They are rounded at their base, where they are slightly indented, but end in acute points. From the joints of the stalks come out alternately long foot-stalks, which sustain the spikes of flowers, which grow in small whorls round the stalks, at about an inch distant.

2. *R. alpinus*, monk's rhubarb, grows naturally on the Alps, but has long been cultivated in the gardens of this country. It has large

roots, which spread and multiply by their offsets: they are shorter and thicker than the patientia, are of a very dark brown on the outside, and yellow within. The leaves are of the round heart-shape, standing upon long foot-stalks. The stalks rise from two to three feet high; they are thick, and have a few small roundish leaves on the lower part, but the upper part is closely garnished with spikes of white flowers standing erect close to the stalks. These appear in the end of May, and are succeeded by large triangular seeds, which ripen in August.

3. *R. aquaticus*, the water-dock, grows naturally in ponds, ditches, and standing waters, in many parts of Britain. It is supposed to be the herba Britannica of the ancients. It has large roots, which strike deep into the loose mud, sending out leaves about two feet long. The stalks rise five or six feet high, when the plants grow in water, but in dry land seldom more than three; these are garnished with narrow leaves among the spikes of flowers to the top. The flowers stand upon slender foot-stalks, which are reflexed; they are of an herbaceous color, appear in June, and the seeds ripen in autumn.

4. *R. patientia*, patience rhubarb, was formerly much more cultivated in the British gardens than at present. The root is large, and divides into many thick fibres; their outer cover is brown, but yellow within, with some reddish veins; the leaves are broad, long, and acute-pointed; their foot-stalks are of a reddish color; the stalks rise six or seven feet high, and divide towards the top into several erect branches, garnished with a few narrow leaves, terminating with loose spikes of large staminous flowers. These appear in June, and are succeeded by pretty large three-cornered seeds, whose coverings are entire, which ripen in autumn. These plants are but seldom cultivated; and so easily multiply by their numerous seeds that they soon become troublesome weeds where they once get an entrance.

RUMFORD. See ROMFORD.

RUMINANT, *adj.*

RUMINATE, *v. n. & v. a.* } French *ruminer*;
 } Lat. *rumino*. Having

RUMINATION, *n. s.* } ing the power of
 } chewing the cud: to chew the cud: hence to muse; reflect: as a verb active, to chew over again; muse on: the noun substantive corresponding.

The condemned English

Sit patiently, and inly *ruminate*

The morning's danger.

Shakspeare.

It is a melancholy of mine own, extracted from many objects, in which my often *rumination* wraps me in a most humorous sadness.

Id.

Alone sometimes she walked in secret, where To *ruminate* upon their discontent.

Fairfax.

Others filled with pasture gazing sat, Or bedward *ruminating*.

Milton's Paradise Lost.

Of rising prudence here he *ruminates*, Of rising kingdoms, and of falling states.

Waller.

Mad with desire she *ruminates* her sin, And wishes all her wishes o'er again; Now she despairs, and now resolves to try, Would not, and would again, she knows not why.

Dryden.

Ruminant creatures have a power of directing this peristaltick motion upwards and downwards.

Ray.

The necessity of spittle to dissolve the aliment, appears from the contrivance of nature in making the salivary ducts of animals, which *ruminate*, or chew the cud, extremely open.

Arbuthnot.

Rumination is given to animals, to enable them at once to lay up a great store of food, and afterwards to chew it.

Id.

I am at a solitude, an house between Hampstead and London, wherein Sir Charles Sedley died: this circumstance sets me a thinking and *ruminating* upon the employments in which men of wit exercise themselves.

Steele to Pope.

The description given of the muscular part of the gullet, is very exact in *ruminants*, but not in men.

Derham.

He practises a slow meditation, and *ruminates* on the subject; and perhaps in two nights and days rouses those several ideas which are necessary.

Watts on the Mind

Retiring, full of *rumination* sad,

He mourns the weakness of these latter times.

Thomson.

RUMINANT, in natural history, is applied to an animal which chews over again what it has eaten before. Peyer, in a Treatise De Ruminantibus et Ruminatione, shows that there are some animals which really ruminate, as oxen, sheep, deer, goats, camels, hares, and squirrels; and that there are others which only appear to do so, as moles, crickets, beetles, crabs, mullets, &c. The latter class, he observes, have their stomachs composed of muscular fibres, by which the food is ground up and down as in those which really ruminate. Mr. Ray observes that ruminants are all four-footed, hairy, and viviparous; some with hollow and perpetual horns, others with deciduous ones.

RUMMAGE, *v. a.* Fr. *remuage*; Germ. *rummen*, to empty.—Skinner. To search; plunder; evacuate.

Our greedy seamen *rummage* every hold
Smile on the booty of each wealthier chest.

Dryden.

A fox was *rummaging* among a great many carved figures; there was one very extraordinary piece.

L'Estrange.

I have often *rummaged* for old books in Little Britain and Duck-lane.

Swift.

RUMMER, *n. s.* Sax. *rumor*; Dan. and Belg. *roemer*. A large glass; a drinking cup.

Imperial Rhine bestowed the generous *rummer*.

Philips.

RUMNEY. See ROMNEY.

RUMOR, *n. s. & v. a.* } Fr. *rumeur*; Lat
 } *rumor*. Flying or

popular report; fame: to report or bruit abroad: the noun substantive corresponding.

Great is the *rumour* of this dreadful knight,
And his achievements of no less account.

Shakspeare.

Catesby, *rumour* it abroad,
That Anne my wife is sick, and like to die.

Id.

A slave
Reports, the Volscians, with two several powers,
Are entered into the Roman territories.

—Go see this *rumourer* whipt: it cannot be.

Id.

Rumour next and chance

And tumult and confusion all embroiled.

Milton.

All abroad was *rumoured*, that this day
Samson should be brought forth.

Id. Agonistes.

He was *rumoured* for the author, and as such pub-

lished to the world by the London and Cambridge stationers.
Fell.

'Twas *rumoured*,
 My father 'scaped from out the citadel. *Dryden.*

She heard an ancient *rumour* fly,
 That times to come should see the Trojan race
 Her Carthage ruin. *Id. Æneis.*

RUMP, *n. s.* Belg. *romp*; Teut. *rumpff*. The end of the back bone; used of beasts, and contemptuously of human beings.

At her *rump*, she growing had behind
 A fox's tail. *Spenser.*

A sailor's wife had chesnuts in her lap,
 And mouncht:—Give me, quoth I:
 Aroint thee, witch! the *rump*-fed ronyon cries.
Shakspeare.

He charged him first to bind
 Crowdero's hands on *rump* behind. *Hudibras.*
 Rumps of beef with virgin honey strewed. *King.*
 If his holiness would thump

His reverend bum 'gaunst horse's *rump*,
 He might b' equipt from his own stable. *Prior.*

Last trotted forth the gentle swine,
 To ease her itch against the stump,
 And dismally was heard to whine,

All as she scrubbed her meazly *rump*. *Swift.*

RUMPHIA, in botany, a genus of the monogynia order, and triandria class of plants: *cal.* trifid; the petals three; the fruit a trilobular plum. Species one only, a tree of the East Indies.

RUMPLE, *v. a. & n. s.* Sax. *pyrmbelle*; Belg. *rompelen*; Teut. *rumpsel*. To crush or contract into wrinkles: the wrinkle or fold made.

Fair Virginia would her fate bestow
 On Rutila, and change her faultless make
 For the roul *rumple* of her camel-back. *Dryden.*

Each vital speck, in which remains
 Th' entire, but *rumpled* animal, contains
 Organs perplexed. *Blackmore on the Creation.*

I *rumpled* petticoats, or tumbled beds,
 Or discomposed the head-dress of a prude. *Pope.*

Never put on a clean apron till you have made
 your lady's bed, for fear of *rumpling* your apron.

Swift.

RUMSEY. See ROMSEY.

RUN, *v. n., v. a. & n. s.* Sax. *pinnan*; Goth.

RUN'AGATE, *n. s.* } and Swed *rima*;

RUN'AWAY, } Teut. and Belg. *ren-*

RUN'NER. } *nen*. To move

swiftly, or at a quick pace; pass on the surface of the ground; have course; rush; emit; flow; stream; be liquid, fluid, or fusible; melt; vanish: hence to pass in thought or word; be mentioned cursorily; be known popularly; go on; proceed; tend; go on violently or irregularly; taking *after*, *away*, *away with*, *on*, *over*, and *out* before the object: as a verb active, to drive; force; stab; pierce; trace; melt; prosecute; venture; venture against law; taking *down* before the object. This verb, as Johnson says, may be observed always to retain much of its primitive idea, and to imply progression, and, for the most part, progressive violence; a run is a course of motion; the act of running: flow; cadence; general reception; modish clamor: 'at the long run,' in fine, in the result: a runagate and runaway alike signify a fugitive: a rebel; apostate; one who flies from danger: runner, a racer or messenger; a shooting sprig; the moving stone of a mill.

Laban *ran* out unto the man unto the well.

Genesis xxiv. 29.

Joseph is a fruitful bough, whose branches *run* over the wall. *Id.* xlix. 22.

The Lord sent thunder, and the fire *ran* along upon the ground. *Ezekiel* ix. 25.

Whether his flesh *run* with his issue, or be stopped, it is his uncleanness. *Leviticus* xiii. 3.

God bringeth the prisoners out of captivity; but letteth the *runagates* continue in scarceness. *Psalms* lxxviii. 6.

Their feet *run* to evil, and make haste to shed blood. *Proverbs.*

Running under the island Claudia, we had much work to come by the boat. *Acts* xxvii. 16.

They *run* the ship aground. *Id.* xxvii. 41.
 Many have *run* out of their wits for women. *I Esdras* iv.

The wretch compell'd, a *runagate* became,
 And learned what ill a miser state doth breed. *Sidney.*

If, through our too much security, the same should *run on*, soon might we feel our estate brought to those lamentable terms, whereof this hard and heavy sentence was by one of the ancients uttered.

Hooker.

This proud Turk offered scornfully to pass by without vailing, which the Venetian captains not enduring, set upon him with such fury that the Turks were enforced to *run* both their galleys on shore. *Knolles's History.*

Neither was he ignorant what report *run* of himself, and how he had lost the hearts of his subjects. *Knolles.*

My conscience will serve me to *run* from this Jew, my master. *Shakspeare. Merchant of Venice.*

My statues,
 Like a fountain, with a hundred spouts,
 Did *run* pure blood. *Id. Julius Cæsar.*

A hound *runs* counter, and yet draws dry food well. *Shakspeare.*

If you suspend your indignation against my brother, till you can derive from him better testimony of his intent, you should *run* a certain course. *Id. King Lear.*

If thou rememberest not the slightest folly
 That ever love did make thee *run* into,
 Thou hast not loved. *Id. As You Like It.*

Fore-spent with toil, as *runners* with a race,
 I lay me down a little while to breathe, *Shakspeare.*

From growing riches with good cheer,
 To *running out* by starving here. *Id.*

Poor Romeo is already dead, *run* through the ear with a love song. *Id. Romeo and Juliet.*

Thou *runaway*, thou coward, art thou fled?
 Speak in some bush; where dost thou hide thy head? *Shakspeare.*

As Cain, after he had slain Abel, had no certain abiding; so the Jews, after they had crucified the Son of God, became *runagates*. *Raleigh.*

The difference between the valour of the Irish rebels and the Spaniards was, that the one *ran away* before they were charged, and the other straight after. *Bacon.*

In some houses wainscots will sweat, so that they will almost *run* with water. *Id.*

The owner hath incurred the forfeiture of eight years' profits of his lands, before he cometh to the knowledge of the process that *runneth* against him. *Id.*

A man's nature *runs* either to herbs or weeds; therefore let him seasonably water the one, and destroy the other. *Id.*

Running on with vain prolixity. *D. Walton.*

The priest and people *run* about,
And at the ports all thronging out,
As if their safety were to quit
Their mother. *Ben Jonson.*

He bath *run* out himself, and led forth
His desperate party with him; blown together
Aids of all kinds. *Id. Catiline.*

Discourses *ran* thus among the clearest observers:
it was said that the prince, without any imaginable
stain of his religion, had, by the sight of foreign
courts, much corroborated his judgment.

Wotton's Buckingham.

Thirst of fame makes them seek to climb to heaven;
it makes them not fear to *run* down headlong to hell.
Bp. Hall.

The rest dispersed *run*, some disguised,
To unknown coasts: some to the shores to fly.
Daniel.

Insectile animals, for want of blood, *run* all out
into legs. *Hammond.*

The king's ordinary style *runneth*, our sovereign
lord the king. *Saunderson.*

We have many evils to prevent, and much danger
to *run* through. *Taylor.*

The zeal of love *runs* out into suckers, like a fruit-
ful tree. *Id. Rule of Holy Living.*

Take here her reliques and her gods, to *run*
With them thy fate, with them new walls expect.
Denham.

He would himself be in the Highlands to receive
them, and *run* his fortune with them. *Clarendon.*

Rivers *run* potable gold. *Milton.*

Day yet wants much of his race to *run*. *Id.*

Hath publick faith, like a young heir,
For this taken up all sorts of ware,
And *run* into every tradesman's book,
Till both turned bankrupts? *Hudibras.*

They, when they're out of hopes of flying,
Will *run* away from death by dying. *Id.*

Customs *run* only upon our goods imported or ex-
ported, and that but once for all; whereas interest
runs as well upon our ships as goods, and must be
yearly paid. *Child.*

Hath falsehood proved at the long *run* more for
the advancement of his estate than truth? *Tillotson.*

The greatest vessel, when full, if you pour in
still, it must *run* out some way, and the more it
runs out at one side, the less it *runs* out at the other.
Temple.

Since death's near, and *runs* with so much force,
We must meet first, and intercept his course.
Dryden.

He *ran* up the ridges of the rocks amain. *Id.*

Her form glides through me, and my heart gives way;

This iron heart, which no impression took
From wars, melts down, and *runs*, if she but look.
Id.

Could you hear the annals of our fate;
Through such a train of woes if I should *run*,

The day would sooner than the tale be done. *Id.*

His grisly beard his pensive bosom sought,
And all on Lausus *ran* his restless thought. *Id.*

The estate *runs* out, and mortgages are made,
Their fortune ruined, and their fame betrayed. *Id.*

The common cry
Then *ran* you down for your rank loyalty. *Id.*

Here those that in the rapid course delight,
The rival *runners* without order stand. *Id.*

They *ran* down a stag, and the ass divided the prey
very honestly. *L'Estrange.*

Wickedness may prosper for a while, but, at the
long *run*, he that sets all knaves at work, will pay
them. *Id.*

The ass sets up a hideous bray, and fetches a *run*
at them open mouth. *Id.*

If there remains an eternity to us, after the short
revolution of time we so swiftly *run* over here, 'tis
clear that all the happiness that can be imagined,
in this fleeting state, is not valuable in respect of the
future. *Locke.*

That punishment follows not in this life the breach
of this rule, and consequently has not the force of a
law, in countries where the generally allowed prac-
tice *runs* counter to it, is evident. *Id.*

Thoughts will not be directed what objects to pur-
sue, but *run* away with a man in pursuit of those
ideas they have in view. *Id.*

Though putting the mind unprepared upon an un-
usual stress may discourage it, yet this must not *run*
it, by an overgreat shyness of difficulties, into a lazy
sauntering about ordinary things. *Id.*

I shall *run* the danger of being suspected to have
forgot what I am about. *Id.*

A talkative person *runs* himself upon great incon-
veniences, by blabbing out his own or others' secrets.
Racy.

If the richness of the ground cause turnips to *run*
to leaves, treading down the leaves will help their
rooting. *Mortimer.*

In every root there will be one *runner*, which hath
little buds on it, which may be cut into. *Id.*

The mill goes much heavier, by the stone they call
the *runner* being so large. *Id.*

Your iron must not burn in the fire; that is, *run*
or melt; for then it will be brittle. *Moxon.*

Study your race, or the soil of your family will
dwindle into cits, or *run* into wits. *Tuttler.*

The world had not stood so long, but we can still
run it up to artless ages when mortals lived by plain
nature. *Burnet.*

It is no such hard matter to convince or *run* down
a drunkard, and to answer any pretences he can allege
for his sin. *South.*

See daisies open, rivers *run*. *Parnel.*

Some papers are written with regularity; others
run out into the wildness of essays. *Spectator.*

Hipparchus, going to marry, consulted Philander
upon the occasion; Philander represented his mis-
tress in such strong colours, that the next morning
he received a challenge, and before twelve he was *run*
through the body. *Id.*

The dire example *ran* through all the field,
Till heaps of brothers were by brothers killed.
Addison.

As wax dissolves, as ice begins to *run*,
And trickle into drops before the sun,
So melts the youth. *Id. Ovid.*

As fast as our time *runs*, we should be very glad
in most parts of our lives that it *ran* much faster.
Addison.

Virgil, in his first Georgick, has *run* into a set of
precepts foreign to his subject. *Id.*

This church is very rich in relics, which *run* up
as high as Daniel and Abraham. *Id.*

If we *run* over the other nations of Europe, we
shall only pass through so many different scenes of
poverty. *Id.*

Some English speakers *run* their hands into their
pockets, others look with great attention on a piece of
blank paper. *Id.*

It is impossible for detached papers to have a ge-
neral *run* of long continuance, if not diversified with
humour. *Id.*

The time of instance shall not commence or *run*
till after contestation of suit. *Asylife's Paragon.*

I would gladly understand the formation of a soul,
and *run* it up to its punctum saliens. *Cutler.*

This *run* in the head of a late writer of natural

history, who is not wont to have the most lucky hits in the conduct of his thoughts. *Woodward.*

I have known several instances, where the lungs run through with a sword have been consolidated and healed. *Blackmore.*

It is a confederating with him, to whom the sacrifice is offered; for upon that the apostle's argument runs. *Atterbury.*

O that I could now prevail with any one to count up what he hath got by his most beloved sins, what a dreadful danger he runs. *Calamy.*

On all occasions, she run out extravagantly in praise of Hocus. *Arbutnot.*

The whole runs on short, like articles in an account, whereas, if the subject were fully explained, each of them might take up half a page. *Id. on Coins.*

Searching the ulcer with my probe, the sinus run up above the orifice. *Wiseman's Surgery.*

Our king returned,
The muse ran mad to see her exil'd lord;
On the cracked stage the bedlam heroes roared. *Granville.*

Raw and injudicious writers propose one thing for their subject, and run off to another. *Felton.*

The purest gold must be run and washed. *Id.*

What is raised in the day, settles in the night, and its cold runs the thin juices into thick sly substances. *Cheyne.*

She saw with joy the line immortal run,
Each sire impress, and glaring in his son. *Pope.*

Magnanimity may run up to profusion or extravagance. *Id.*

Run in trust, and pay for it out of your wages. *Swift.*

A horse-boy, being lighter than you, may be trusted to run races with less damage to the horses. *Id.*

When we desire any thing, our minds run wholly on the good circumstances of it; when 'tis obtained, our minds run wholly on the bad ones. *Id.*

To Tonson or Lintot his lodgings are better known than to the runners of the post-office. *Id. to Pope.*

Heavy impositions lessen the import, and are a strong temptation of running goods. *Swift.*

You cannot but have observed what a violent run there is among too many weak people against university education. *Id.*

He shows his judgment, in not letting his fancy run out into long descriptions. *Broome on Odyssey.*

He no where uses any softness, or any run of verses to please the ear. *Id.*

In the middle of a rainbow the colors are sufficiently distinguished; but near the borders they run into one another, so that you hardly know how to limit the colors. *Watts.*

Religion is run down by the licence of these times. *Berkeley.*

He will no more complain of the frowns of the world, or a small cure, or the want of a patron, than he will complain of the want of a laced coat, or a running-horse. *Law.*

Though Ramus run in with the first reformers of learning in his opposition to Aristotle; yet he has given us a plausible system. *Baker.*

Run, an extensive salt morass of Hindostan, which bounds the western frontier of Gujerat, and communicates with the gulf of Cutch, several hundred miles in length. It is supposed to have been formerly covered by the sea, but affords excellent pasture, and some fine horses. It belongs to several petty chiefs.

RUNDLET, *n. s.* Perhaps runlet or roundlet. A small barrel.

Set a rundlet of verjuice over against the sun in summer, to see whether it will sweeten. *Bacon.*

The angels did not fly, but mounted the ladder by degrees; we are to consider the several steps and rundles we are to ascend by. *Duppa.*

The third mechanical faculty, styled, axis in peritrochio, consists of an axis or cylinder, having a rundle about it, wherein are fastened divers spokes, by which the whole may be turned round.

Wilkins's Mathematical Magic.

RUNGS, in a ship, the same with the ground timbers; being the timbers which constitute her floor; and are bolted to the keel, whose ends are rung-heads.

RUNGPOOR, or Takhut Koondy, is an extensive district of Bengal, situated about 26° N. lat., bounded on the north by the Bootan mountains, and on the east by the Brahmapootra. It produces rice, sugar, silk, indigo, hemp, and tobacco. The glandular swellings of the throat are very prevalent here. Besides the Brahmapootra, it is watered by the Teestah and Durlah. Its chief towns are Rungpore, Guzgotia, and Mungullaut. This district was taken possession of, and colonised by the Mahometans in the thirteenth century, and was always governed by a foudedar or military collector. Between 1730 and 1740 it was ruled by Sayed Ahmed, nephew of Aly Verdy Khan, who is accused of having been very oppressive, and compelling the rajahs of Dinagore and Couch Behar to pay him tribute. It is now governed by a civil establishment of judge, collector, &c., and is subservient to the court of circuit and appeal of Dacca. Couch Behar is included in this collectorship.

RUNGPORE, the capital of the above district, is situated on the eastern bank of the Goggot, is a very regular built town, and carries on a considerable trade with Bootan, Assam, and Calcutta. The judge and collector reside at Nuwalgunge, about a mile from the town. Long. 89° 5' E., lat. 25° 47' N.

RUNGPORE, an extensive fortress of Gergong, the ancient capital of Assam. It is situated on an island, and can only be approached by a bridge, which was built some centuries ago.

RUNNEL, *n. s.* From run. A rivulet; a small brook.

With murmur loud, down from the mountain's side,

A little runnel tumbled neere the place. *Fairfax.*

RUNNER, in the sea language, a rope belonging to the garnet and the two bolt tackles. It is reeved in a single block joined to the end of a pendant; it has at one end a hook to hit into any thing; and at the other a double block, into which is reeved the fall of the tackle, or the garnet, by which means it purchases more than the tackle would without it.

RUNET, *n. s.* Sax. gepunnen, coagulated. A liquor made by steeping the stomach of a calf in hot water, and used to coagulate milk for curds and cheese. It is also written RENNET, which see.

The milk of the fig hath the quality of a runnet to gather cheese. *Bacon's Natural History.*

It coagulates the blood, as *runnet* turns milk.

More.

The milk in the stomach of calves, coagulated by the *runnet*, is rendered fluid by the gall in the duodenum.

Arbuthnot.

RUNNET, or RENNET. See **RENNET.**

RUNNINGTON (Charles), serjeant-at-law, born in Hertfordshire in 1751. He was in 1768 placed with a special pleader, who employed him in a digest of the law of England. He was called to the bar in 1778, and in 1787 to the degree of serjeant. In 1815 he was appointed commissioner for the relief of insolvent debtors, which office he resigned in 1819, and died at Brighton, January 18, 1821. Mr. Runnington published *Hale's History of the Common Law*, 2 vols.; *Gilbert's Law of Ejectments*, 8vo.; *Ruffhead's Statutes at Large*, 4 vols. 4to.; *History of the Legal Remedy by Ejectment*, and the *Resulting Action or Mesne Process*, 8vo.

RUNNION, *n. s.* Fr. *rognant*, scrubbing. A paltry wretch.

You witch! you polecat! you *runnion*!

Shakespeare.

RUNNYMEAD, a celebrated mead, near Egham, in Surrey, where king John was compelled to sign *Magna Charta*, the great charter of English liberty, and the *Charta de Foresta*. See **ENGLAND**.

RUNT, *n. s.* *Runte*, in the Teutonic dialects, signifies a bull or cow, and is used in contempt by us for small cattle; as the Welsh term *kefyl*, a horse, is used for a worthless horse. Johnson.—Goth. *rian*, *raut*, Thomson. Any small animal; below the natural growth of the kind.

Reforming Tweed

Hath sent us *runts* even of her churches breed.

Cleaveland.

Of tame pigeons, are croppers, carriers, and *runts*.

Walton.

This overgrown *runt* has struck off his heels, lowered his foretop, and contracted his figure.

Addison.

RUPEE, a silver coin current in the East Indies, worth about 2s. 6d. See **COINS**.

RUPERT, prince palatine of the Rhine, and grandson of king James I. of England, was born in 1619. In 1642 he came over into England, and offered his services to king Charles I., his uncle, who gave him a command in his army. At Edgehill he charged with incredible bravery, and made a great slaughter of the parliamentarians. In 1643 he seized the town of Cirencester; obliged the governor of Litchfield to surrender; and, having joined his brother prince Maurice, reduced Bristol in three days, and passed to the relief of Newark. In 1644 he marched to relieve York, where he gave the parliamentarians battle, and entirely defeated their right wing; but Cromwell charged the marquis of Newcastle with such an irresistible force that the royalists were at length entirely defeated. After this the prince retired to Bristol, which surrendered to Fairfax after a gallant resistance. The king was so enraged at the loss of this city, so contrary to his expectation, that he recalled all prince Rupert's commissions, and sent him a pass to go out of the kingdom. In 1648 he

went to France, was highly complimented by that court, and kindly received by king Charles II., who was there at the time. Afterward he was constituted admiral of the king's navy: infested the Dutch ships, many of which he took; and, having engaged with De Ruyter, obliged him to fly. He died in 1682, and was interred in king Henry VII.'s chapel, Westminster, with great magnificence. He seldom engaged but he gained the advantage, which he generally lost by pursuing it too far. He was better qualified to storm a citadel, or even to mount a breach, than patiently to sustain a siege. He took the hint of his discovery of mezzotinto, it is said, from a soldier scraping his rusty fusil. The first mezzotinto print ever published was the work of his hands, and may be seen in the first edition of Evelyn's *Sculptura*. The secret is said to have been soon after discovered by Sherwin, an engraver, who made use of a loaded file for laying the ground. The prince, upon seeing one of his prints, suspected that his servant had lent him his tool, which was a channeled roller; but, upon receiving full satisfaction to the contrary, he made him a present of it. The roller was afterwards laid aside; and an instrument with a crenelled edge, shaped like a shoemaker's cutting knife, was used instead of it. He also invented a metal called by his name, of which guns were cast.

RUPERT'S DROPS, a sort of glass drops with long and slender tails, which burst to pieces on the breaking off those tails in any part; invented by prince Rupert. Their explosion is attended in the dark with a flash of light; and, by being boiled in oil, the drops are deprived of their explosive quality. See **ANNEALING**.

RUPPIN, New, a town of Brandenburg, Prussia, in the government of Potsdam, on a lake of the same name. It is regularly built, the streets intersecting each other at right angles, and has a high church, high school, council-house, barracks, hospital, a workhouse, and a very large building for exercising the troops. It contains 4600 inhabitants, besides a garrison. The principal employments are weaving woollen, tanning, and making gloves. Old Ruppín is a small town, a little farther to the north, with 1000 inhabitants. Thirty-five miles N. N. W. of Berlin.

RUPTION, *n. s.* } Lat. *ruptus*.

RUPTURE, *n. s., v. a., & v. n.* } Breach; solution of continuity: the act of breaking; hernia: to break; suffer disruption.

The egg,

Bursting with kindly *rupture*, forth disclosed

Their callow young.

Milton.

A lute string will bear a hundred weight without *rupture*, but at the same time cannot exert its elasticity.

Arbuthnot.

The plenitude of vessels or plethora causes an extravasation of blood by *ruption* or apertion.

Wiseman.

The *rupture* of the groin or scrotum is the most common species of hernia.

Sharp's Surgery.

The vessels of the brain and membranes, if *ruptured*, absorb the extravasated blood.

Sharp.

When the parties, that divide the commonwealth, come to a *rupture*, it seems every man's duty to chuse a side.

Swift.

RU RAI, *adj.* Fr. *rural*; Lat. *rura*, *ruralis*. Country; existing in the country, not in cities; suiting or resembling the country.

Lady, reserved to do pastor company honour,
Joining your sweet voice to the *rural* musick of desert.
Sidney.

Here is a *rural* fellow,
That will not be denied your highness' presence;
He brings you figs.
Shakespeare. Cymbeline.

We turn
To where the silver Thames first *rural* grows.
Thomson.

The summit gained behold the proud alcove
That crowns it! yet not all its pride secures
The grand retreat from injuries impressed
By *rural* carvers, who with knives deface
The pannels, leaving an obscure rude name.
In characters uncouth, and spelled amiss.
Couper.

RURAL ARCHITECTURE. The application of such architectural science as was then in practice, to the accommodation of the agriculturist, must have taken place at a very early period of human history. We have already (see the article *AGRICULTURE*) endeavoured to trace the history of agricultural improvements generally—our business in this and the succeeding article is strictly practical; and will relate to the most expedient methods which have been suggested in modern times for farm buildings, and the general economy of a farm.

On the first of these subjects the reader may further consult the article *FARM*, where the laying out of farm lands, and the construction of the principal farm erections, are dwelt upon. In the present article, the smallest farm-house and farm-cottages will engage our attention; farm-stables, buildings for the accommodation of stock, poultry-houses, barns, straw-houses, cart-sheds, &c.

1. *Of the smaller farm-house and farm-cottages.*—The smallest farm-house will be that in which the farmer keeps no servant, and cultivates a few acres. Such a house should consist of an entry or porch at the end, and ranging by the side of a dairy and pantry; a kitchen of good size, say twelve to fifteen feet square; a parlour of equal size; a light closet off the parlour and at the opposite end of the house to the dairy; tool-house adjoining it; staircase and cellar under; poultry-house, and three bed-rooms up stairs. The ground plan of such a house is given in Plate *RURAL ARCHITECTURE*, fig. 1.

A farm-house forming a medium between this and that of what may be called a professional farmer is given in figs. 2 and 3. Here the farmer is supposed to keep a servant, who is domesticated with him, and the poultry and tool-house are in the yard. It contains an entrance and stair (*a*); kitchen, closet, and oven (*b*); back kitchen (*c*); dairy (*d*); parlour (*e*); bedroom (*f*); with three bedrooms and a garret up stairs, and a cellar under.

In larger farm-houses the servants' rooms have been recommended to be quite distinct from the house. Where farms are large, and consequently a great number of servants wanted, particularly where they are unmarried, suitable and convenient rooms for sleeping in, and, where they find their own provisions, for preparing and dressing them in, are not merely

requisite, but of considerable advantage to the farmer, as well as the men, as they save much time, which would otherwise be lost, in going to their meals; besides keeping them together in a sober, steady state, ready for their different employments. In this way, too, the servants are a great deal more comfortable, and live far more cheaply than when they go to the public-houses to eat their meals, as is much the case in the southern parts of the kingdom. But inconveniences of this kind are probably the best guarded against by having such servants, when it can be done, in the houses of the farmers, in which cases the eating-rooms for them should be so placed as that a facility may be given or overlooking them. But the rooms for lodging in should, at the same time, be quite detached and distinct, such persons being frequently careless and negligent of their candles and fires, besides being irregular in other parts of their conduct. In whatever situations such rooms may be erected, the ground-floors should be formed of stone, brick, or some other incombustible material, while the upper ones are laid with plaster, as in some of the midland districts.

Mr. J. Wood, of Bath, has suggested cottages of four classes, for laborers, having from one to four rooms each. See his Series of Plans for Cottages. They should be constructed, he says, on the following principles:

'The cottage should be dry and healthy; this is effected by keeping the floor sixteen or eighteen inches above the natural ground; by building it clear of banks, on an open spot of ground, that has a declivity or fall from the building; by having the rooms not less than eight feet high—a height that will keep them airy and healthy; and by avoiding having chambers in the roof.

'They should be warm, cheerful, and comfortable. In order to attain these points, the walls should be of a sufficient thickness (if of stone, not less than sixteen inches; if of brick, at least a brick and a half) to keep out the cold of the winter, or the excessive heat of the summer. The entrance should be screened, that the room, on opening the door, may not be exposed to the open air; the rooms should receive their light from the east or the south, or from any point betwixt the east and the south; for, if they receive their light from the north, they will be cold and cheerless; if from the west, they will be so heated by the summer's afternoon sun, as to become comfortless to the poor laborer, after a hard day's work; whereas, on the contrary receiving the light from the east or the south, they will be always warm and cheerful. So like the feelings of men in a higher sphere are those of the poor cottager, that if his habitation be warm, cheerful, and comfortable, he will return to it with gladness, and abide in it with pleasure.

'They should be rendered convenient, by having a porch or shed to screen the entrance, and to hold the laborer's tools; by having a shed to serve as a pantry, and store-place for fuel; by having a privy for cleanliness and decency's sake; by a proper disposition of the windows, doors, and chimneys; by having the stairs, where there is an upper floor, not less than three

Fig. 3.

Fig. 2.

Fig. 1.

Fig. 4.

feet wide, the rise or height not more than eight inches, and the tread or breadth not less than nine inches; and, lastly, by proportioning the size of the cottage to the family that is to inhabit it; there should be one lodging-room for the parents, another for the female, and a third for the male children; it is melancholy, he says, to see a man and his wife, and sometimes half a dozen children, crowded together in the same room; nay, often in the same bed; the horror is still heightened, and the inconvenience increased, at the time the woman is in child-bed, or in case of illness, or of death; indeed, whilst the children are young, under nine years of age, there is not that offence to decency, if they sleep in the same room with their parents, or if the boys and girls sleep together, but after that age they should be kept apart.

‘Cottages should not be more than twelve feet wide in the clear, that being the greatest width that it would be prudent to venture the rafters of the roof, with the collar-pieces only, without danger of spreading the walls; and, by using collar-pieces, there can be fifteen inches in height of the roof thrown into the upper chambers, which will render dormer-windows useless.

Cottages should be always built in pairs, either at a little distance from one another, or close adjoining, so as to appear one building, that the inhabitants may be of assistance to each other, in case of sickness or any other accident.

‘For economy, cottages should be built strong, and with the best of materials, and these materials well put together; the mortar must be well tempered and mixed, and lime not spared: hollow walls bring on decay, and harbour vermin; and bad sappy timber soon reduces the cottage to a ruinous state. Although cottages need not be fine, yet they should be regular; regularity will render their ornaments to the country, instead of their being, as at present, disagreeable objects.

‘A piece of ground should be allotted to every cottage, proportionable to its size; the cottage should be built in the vicinity of a spring of water—a circumstance to be attended to; and, if there be no spring, let there be a well.’

‘Humanity,’ Beaton well observes, ‘shudders at the idea of an industrious laborer, with a wife, and perhaps five or six children, being obliged to live, or rather exist, in a wretched, damp, gloomy room, of ten or twelve feet square, and that room without a floor; but common decency must revolt at considering that over this wretched apartment there is only one chamber, to hold all the miserable beds of this miserable family. And yet instances of this kind, to our shame be it spoken, occur in every country village. How can we expect our laborers or their families to be healthy, or that their daughters, from whom we are to take our future female domestics, should be cleanly, modest, or even decent, in such wretched habitations?’

The last writer describes an economical staircase for cottages, in which every step is divided into two parts, half of it being just double the height of the other half. In ascending his stair the left foot is set on the left step, and the right

foot on the right, alternately to the top of the stair. It is clear, therefore, that as the steps for the right and for the left foot are in the same line, and although neither foot rises each time higher than seven inches and a half above the other, yet every time that one foot is moved, it rises fifteen inches higher than it was before. In a stair of this kind, if each tread or breadth for the foot be nine inches, and each rise of the one foot above the other seven inches and a half, as each foot rises the height of two steps, or fifteen inches, every time it is moved, it is plain that six steps of this kind will rise as high as twelve in the common way, and will require only one half the size of a hatch or opening in the floor above, that would be required for those twelve steps as usually constructed. This will be of advantage, where much is required to be made of little room, and will of course give more space to the chambers above.

In addition to our better farm-houses, given under the article *FARM*, we may here subjoin the elegant design of a very commodious and ample farmery given in the General Report of the Agricultural State of Scotland:—The dwelling-house contains two parlours, fig. 4 (*a, b*); kitchen (*c*); dairy (*d*); pantry (*e*); dining parlour (*f*); bed-rooms (*g, h*); cellars (*i*). The farmery consists of cart-sheds and granary over (*a*); riding horse stable (*b*); common stable (*c*); stalled cattle (*d*); places for tools and other articles of the cattle attendant (*e*); entrance from the spacious root or turnip shed (*f*); straw (*g*); threshing-machine and water-wheel (*h*); granaries and straw-lofts over (*g, l, m*); tools and sundries (*i*); smith’s shop (*j*), and carpenter (*k*).

2. *Of farm stables*.—Stables of all kinds should be situated on dry hard ground; and, if possible, on an ascent, for the sake of drainage: the windows or some openings should be made to the north or east, that the north winds may be let in in the summer to cool them, and the rising sun all the year round. Close window-shutters are always a valuable addition.

Farm stables should of course be contiguous to those other offices with which they are naturally connected. Beaton objects to the mode of making the racks and mangers of a farm stable run quite across the upper end of the stall. Servants, he observes, in order to save trouble, are very apt to stuff the racks full of hay, however large they may be, from which many bad consequences arise, and much hay is lost or destroyed by being pulled down and mixed with the litter. Besides, various bad effects result from the practice of suffering horses to be continually stuffing themselves with hay, as is well known to those who are accustomed to the proper management of such animals; as under their directions they are never permitted to have much hay in their racks at a time. Another disadvantage also attends this mode of fitting up stalls, especially for farm-houses, as it ought to be the object to preserve every thing; the hay-seeds are totally lost. And, by the practice of placing the racks with so much inclination outwards, the seeds are also very apt to fall into the horse’s ears and eyes, which often cause disagreeable effects. For these reasons it is said that racks should

have a perpendicular direction, not having a space of more than fourteen or sixteen inches from the wall; the bottom being sparred, in order to let the seeds fall down through below, whence they may be removed by a sort of sliding shutter. These advantages may also be neatly and conveniently obtained by leaving niches in the walls for the racks, on which plan the spars will be equal with the insides of the walls. Where the niches and racks are made in the middle of the stalls, two feet, or two feet and a half wide, will in most cases be sufficient; they should, however, be carried down low enough to admit of a small box or drawer being placed under them, for the reception of the hay-seeds. Racks of this sort may likewise be placed in the corners of the stalls, and be made in such a way as that one niche may serve two stalls. And they may be placed in the angles of the stalls without having any niche, and may be made of a semicircular form. But, in whatever way they are formed, there should constantly be a division betwixt them, which is probably best made of deal. Where the racks are put in the corners of the stalls, it may perhaps be more advantageous to have them straight than circular; but, in whichever way they are formed, the farmer should always have a hatch fixed for each stall, as by that means a great deal of time may be saved in feeding his horses. If the above methods be adopted, it must be unnecessary to make a manger of the same width with the stall; as a box or drawer, sixteen or eighteen inches long, and twelve or fourteen inches wide, will answer every intention perfectly well. But it should be so contrived that it may be readily taken out and cleaned whenever it is fouled, or becomes furred with dirt. With the fixed mangers this can never be done.

There is another method of making stalls, which, as being cheaper and more economical, deserves to be regarded by the farmer: on this plan the stable has neither racks nor mangers; the head of the stall is boarded about three feet from the ground, having a space of about two feet from the wall, in which the hay is to be deposited, the horse pulling his hay from below, instead of drawing it from above; which is not only more natural, but prevents the waste of hay, much of which drops down and is lost when the horse eats from a rack. But even in this construction it will be necessary to have the bottom sparred within eight or ten inches of the ground, and a box, hopper, or hay-manger and drawer, so contrived as to receive the seeds of the hay: where there are double stalls, the boxes may be divided in the middle. Single stalls, where they can be conveniently made, should however always be preferred, as being much more safe and convenient in different points of view, both for the horses and persons employed about them.

The paving of stables is a matter of great importance, though it has been hitherto but little attended to: and whether the stall should have a slight declivity, or be perfectly level, has not perhaps yet been so fully considered as it ought. It would appear to be more natural and easy for these animals to stand and rest themselves on a level surface, than on one that is sloping, as it is

evident that the tendons or sinews of the *pastern* joints must be kept more upon the stretch in the latter than in the former case. The main difficulty in regard to a level stall has been the conveying away of the moisture; but this may be effected by paving the stall perfectly level, and leaving a small drain in the middle, extending within two or three feet of the upper end; but which should not be more than seven or eight inches wide at top, forming an angle at the bottom. The depth at the end nearest the head of the stall need not be more than three or four inches, having as much slope as can be conveniently given it backwards, in order that it may carry the moisture off quickly to the main drain, into which all the stall-drains should have a fall, and the moisture be discharged. And the small stall-drains must also be covered with a piece of good strong oak-plank, in which a great number of holes are bored, and which must be so fastened as to admit of its being readily raised up and let down; as by this means the drains may be washed, and kept clean and sweet, as often as they are found to be furred up and obstructed. Besides these, main drains must be made at the end of the stalls, or in some other convenient situation, for carrying off the moisture into the general receptacle. Where they are placed at the bottoms of the stalls, they should not be closer to the stalls than two feet, in order that the stale of mares may get readily into them, which would not be the case if they were nearer, unless the pavement behind the stalls was made to decline a little towards them. These main drains need not be more than seven or eight inches wide at the top; but they should be covered with plank, in which holes are perforated for conveying away the moisture and wetness. But, with the view of saving the expense of making main drains within the stable, a shallow open drain may be made in the common way, with which the stall drains may communicate by means of very small grates at the ends. And it should be observed that the pavements or floors of the stalls should have a very slight declination from their sides towards the drains, to prevent moisture standing on them; an inch, or an inch and a half in the whole, will however be quite sufficient for these purposes.

In regard to the sizes of stalls, it may be noticed that they differ much according to circumstances; but four feet and a half in width are the least they should ever be made, and five feet are much better. The divisions between them should be high, so that strange horses may not see each other. But where stallions are kept, or young horses required to be left loose in a stall, they should be so enclosed as to be incapable of doing mischief. And, for these purposes, one or more stalls may be sparred to the top, or doors provided, which may be hung to the back posts of the stable. Where this last method is followed, the stalls serve extremely well for keeping different mares and their foals separate from others, as well as many other useful purposes in the business of horse-management with the farmer.

The writer of the *East Lothian Agricultural Survey* has remarked that sometimes stalls are

made double; and, as farm-horses generally work in pairs, each pair that work together have one of these double stalls; for horses are social animals, and it is said they feed better, and are more cheerful, when they live in society. But even in this case it is proper they should be fastened to the opposite sides of the stall, and that each horse should have his own rack and his own manger; for, although they may seem to have a very great attachment to each other, yet, if the dividing of their food is left to themselves, it is more than probable they will quarrel about it, and that the strongest horse will have the best share. But such farm-stables as contain only one row of stalls, with one horse in each stall, are, on the whole, the most useful and convenient; and if the stalls are sufficiently large, and the divisions between them raised sufficiently high, not with spars, as often is the case, but with boards closely joined, each horse will be allowed to eat his proportion of corn and hay equally, and allowed to take the necessary rest, without danger of being disturbed by a troublesome neighbour. The stable ought to be well paved, and of a sufficient breadth to leave a space of at least six or seven feet behind each horse, for a safe passage to the servants in hanging the harness upon the wall, &c. The pavement should decline very gradually from the horse's head backwards, towards the channel at his heels, which should also decline, in the same gradual manner, towards one end of the stable, where the urine may be received into a reservoir. Proper openings should also be left in the walls, for the purpose of ventilation; these should be fitted with sliding or flap-boards, opened in the morning, when the horses go out to work, and shut in the evening: in this way the stables will be properly ventilated; and every risk of cold, from having these openings uncovered during the night, be avoided.

In some cases the racks are fixed about fourteen inches from the walls, with but very little, if any, slant; having their bottom parts laid with small spars, or thin narrow pieces of wood, in an open manner, so that the hay seeds can fall down through between them, and be received in a drawer or box, made for the purpose below, where they are capable of being drawn or taken out at pleasure. A small box, or trough, is placed in some convenient part, answering the purpose of a manger, and which is sometimes made as a drawer, to put in and draw out as there may be occasion. The divisions of the stalls sometimes rise pretty high at the head parts in the ordinary way; and, at other times, in a curving manner at the upper ends, from the tail-posts to nearly the ceilings of the stables; and flap-doors, the height of the lower parts of the divisions, are sometimes fastened with hinges to posts, or the walls behind the horses. In other instances, the racks are placed in half-circular niches or recesses in the walls of the stables, opposite the divisions of the stalls; each niche being made to serve two stalls, by having a division in the middle betwixt them; and the racks themselves are sometimes made in half-circular forms. The same kind of half-circular racks are occasionally also put in the angles or corners of the stalls, without any niches; there

being divisions between them, so as that they may serve two stalls: but the racks, in these cases, have not always the half-circular form, but are made and fixed up in a straight manner. In all these cases, small drawers or boxes serve as mangers, for the horses to eat their provender out of, as may be necessary.

There is sometimes a hopper sort of contrivance in stables, where neither racks nor mangers are employed, which is broad at the top, and has about fourteen inches width in the bottom part; being sparred, in order that the seeds may drop through into a drawer made for the purpose below. In each corner there is a small box for corn, which serves as a manger; the hopper part being divided in the middle, so as to serve two stalls as hay-mangers. This is a neat and convenient mode in some cases, though rather expensive in making and putting up. There are still other contrivances in fitting up racks and stalls for preventing the unnecessary waste of labor and food, as well as to guard against the inconvenience of hay seeds falling into the eyes and ears of horses, which have been suggested by experienced farmers in other countries. In one set of contrivances, in this intention, the racks are placed in an upright manner, and the perpendiculars of them are made to fall on the inner edges of the troughs below, which have shelving leaves. In these cases, when the animals pull out the hay from the racks, the waste parts fall on the leaves, and thus slide down into the troughs, where they are secured from being spoiled by the breath of the horses; while the distance between the bottoms of the racks and the troughs is quite sufficient for the admission of the heads of the horses, so as that they may get at the hay which is dropped. The racks, in these cases, are two feet four inches in depth, and two feet at top from the edge parts of them; being planed within, in order that the hay may fall to the bottoms of the racks gradually, in proportion as it diminishes in quantity, and the animals be saved the trouble of a long reach, which they are often obliged to make in the stables which are fitted up in the old usual manner. The animals are fed and supplied with the fodder from the entry, which is six feet in width; the hay being dropped through a trap-door from the store-room above the stable. This plan is the suggestion of Mr. West, an intelligent North American farmer. Another plan of this kind has been proposed by Mr. Cooper of the United States, in which the racks of the stalls of the stables have a somewhat different construction and position, being formed with what are called flats, or thin strips or pieces of wood. In these the advantages are supposed to be very great, as the upright flats prevent the horses from wasting the hay, as well as from blowing upon it; and, besides, the animals are prevented from looking round, a habit to which horses are much accustomed when any person enters the stable; neither can they thrust their heads over the troughs, as the flats compel them to feed directly over them, without turning to either side. This mode of fitting up the stalls of stables may be found of much utility, in different situations and circumstances, in the management of both saddle, farm, and team-horses. At Holkham Mr

Coke has his mangers themselves, it is said by the writer of the corrected agricultural account of that district, plated with sheet-iron; and the front edges, which are rollers, covered with tin-plates. The bottoms of the stall divisions are made of slate. It has also been found that for stables, as well as all other offices, those locks which have copper wards are the best, as being much more durable than any other kinds.

Stable lofts for saddle as well as for farm, team, and carriage-horses, are also fitted up with different sorts of machinery and contrivances for preparing and reducing the different articles of food, which such horses are to have, into the most proper, and economical forms. These are, for the most part, straw or chaff-cutters, bean, barley, or malt-crackers, and oat-crushing and bruising machines. Such contrivances are often of very great utility and convenience, when properly managed, and put up in such stable buildings, or the rooms connected with them; and particularly where other more valuable uses are to be made of straw, pea and bean-haum, and other similar materials, than that of merely littering animals. They are likewise useful in saving much labor, by their being always ready and at hand.

A lofty stable is recommended by White (*Treatise on Veter. Med.* p. 1), fifteen or twenty but never less than twelve feet high, with an opening in the ceiling for ventilation. The floor he prefers is brick or limestone, inclining not more from the manger to the gutter than an inch in a yard. Some litter, he says, should always be allowed for a horse to stale upon, which should be swept away as often as is necessary. This, with a pail or two of water, thrown upon the floor, and swept off while the horse is at exercise, will keep the stable perfectly clean, and free from offensive smells. The depth of a stable should never be less than twenty feet, nor the height less than twelve. The width of a stall should not be less than six feet clear. But, when there is sufficient room, it is a much better plan to allow each horse a space of ten or twelve feet, where he may be loose and exercise himself a little. This will be an effectual means of avoiding swollen heels, and a great relief to horses that are worked hard. With respect to the rack and manger, White prefers the former on the ground rising three feet high, eighteen inches deep from front to back, and four feet long. The manger, eighteen inches deep, eighteen inches from front to back, and five feet in length. The rack he prefers being closed in front. 'Farm stables in Scotland,' says the editor of *The Farmer's Magazine*, 'are constructed in such a manner that all the horses stand in a line, with their heads towards the same side wall, instead of standing in two lines, fronting opposite walls, as formerly. Those lately erected are at least sixteen feet wide within walls, and sometimes eighteen, and the width of each stall upon the length of the stable is commonly five feet. To save a little room, stalls of nine feet are sometimes made to hold two horses, and, in that case, the manger and the width of the stall are divided into equal parts by what is called a half trevice, or a partition about half the depth of that which separates one

stall from another. By this contrivance, each horse indeed eats his food by himself; but the expense of single stalls is more than compensated by the greater ease, security, and comfort of the horses.

It may be of importance to observe here that stables should be better lighted than is commonly the case, as the blindness which is so frequently met with among horses has lately been attributed, and not without probability, to an excess of the stimulus of light on their coming out of dark or dusky stables. Another practical hint.

Farm-stables are mostly, during the summer months, much exposed to the open air, the doors, wickets, or windows of them being very seldom shut, except at night, and then but rarely; the consequence is, that flies, which are attracted by the horse-dung and other similar matters, have very free access; but as it may commonly be observed that in such exposed stables, too, the spider is very prevalent, as is seen by the number of cobwebs, it may, of course, be unwise and improper to disturb or destroy them, and the insect should probably be cherished in such stables, as it may save the horse from the irritation of a variety of troublesome enemies and disturbers. It has been observed by Mr. Vancouver, that, except in Ireland, where the method of treating farm-horses is extremely bad indeed, those in the county of Devon have perhaps as hard measure dealt out to them as is any where to be met with in the United Kingdom. From the injudicious manner in which they receive the corn, that is occasionally given them, it is supposed, in some measure, a questionable point, whether it affords them a benefit, or, by diverting their appetites from the hay, pea-haum, or other sorts of straw, absolutely produces an injury and disadvantage, in consequence of the avidity with which they swallow the corn in an unchewed state. In order to rectify and remedy such improper modes of management in the stable, and other treatment of farm and heavy team-horses, a better and more desirable example, it is thought, can nowhere be found than that which may be drawn from the management of farm and waggon-horses in Pennsylvania and Maryland. These horses, it is said, perform journeys of 200 and 300 miles over the stupendous mountains of that country, with prodigious loads of wheat and flour from the interior, and wet and dry goods from the sea-ports to the different points of embarkation, at Fort Pitt, Red-stone, Charlestown, Wheeling, and other places on the Ohio River. Notwithstanding which, these waggon-horses, through the whole extent of that country, are, it is asserted, seldom seen in a less high condition than the brewers' and other large cart-horses in the metropolis of this country. The manner in which these American horses are sustained and supported, so as to perform these labors, is, it is said, generally by feeding them, in the stables and on the roads, with hay and straw chopped in short pieces about half an inch in length, with which is mixed about half a peck of rye, oat, and Indian corn-meal, to about two and a half or three pecks of hay chopped in the same manner. A feeding-trough, sufficiently large for four or

five horses to eat out of at the same time, is attached to each waggon, it is said, while on the road. The chaff is put into this trough, and, after being well mixed with the given quantity of meal, is moistened, and again well stirred together, until every shred or part of the hay or chopped straw is found to be covered, or, as it were, frosted over by the meal. The avidity with which the horses eat their meat, or provender, when thus prepared, may, it is supposed, be readily conceived. Their feed or meal being finished, they either pursue their journey or lie down to rest: but in either case, it is observed, not without being well dressed, and perfectly freed and cleansed from the muddy and other effects of their last labor. It is the pride and pleasure, it is said, of the carters, as well as of the waggon masters in that country, to see their horses in a condition above rather than under the labor which they have to perform; and in 100 miles travelling, from Baltimore to Philadelphia, it is confidently asserted that as many prime waggon-horses, and in as high condition, may be seen, as is the case in any direction for the same distance from the chief city of this country.

What are called *horse-hammels*, or sheds, with distinct yards, have been used as stables with great success in Berwickshire. Each shed holds two horses, with a niche for harness; to each there is an open straw yard, of small size, with a water trough, and a gate large enough to admit a cart to take out the dung. Mr. Herriot, of Ladykirk, has long used these buildings, and has lost no horse by death for a number of years. His horses lie in these open hammels in winter; and it is remarked that in frosty weather, when snow is falling, and lying on the ground, the animals do not go under cover, but prefer to lie out, with their backs and sides covered with snow. It is known that, if a horse is kept out in winter, he will have no grease, nor swelled legs, and perhaps few other diseases. Every farmer who keeps a large stock of horses, occasionally loses one by inflammation, brought on by coughs and colds; but the horses of the farmer alluded to become aged, and he has not had occasion to purchase a young horse for several years.—(Husb. of Scot. i. 26.)

3. *Of buildings for live stock.*—The cattle-shed is used both for lodging milch cows, and feeding cattle for the butcher. The principal requisites are, that they can be readily and well aired, and that they are so constructed as to save labor in feeding and cleaning the cattle. There are three ways in which cattle are placed in them; first, in a row towards one of the walls; secondly, in two rows, either fronting each other, with a passage between, or with the heads to each wall; or thirdly, across the building in successive rows. It is common to have an opening in the walls, through which turnips are supplied; but the plan most approved, and now becoming general, is to fix the stakes to which the cattle are tied about two and a half or three feet from the wall, which allows the cattle-man, without going among them, to fill the troughs successively from his wheelbarrow or basket. It is also an improvement to keep the cattle separate, by par-

titions at least between every two. The width of such stalls should not be less than seven feet and a half.

Cattle hammels have also been adopted in Berwickshire. Two cattle are here usually kept together, and go loose, in which way they are thought by some to thrive better than when tied to a stake, and, at the same time, feed more at their ease than when a number are kept together. All that is necessary is, to run partition walls across the sheds and yards of the farmers; or, if these are allotted to rearing stock, one side of the square, separated by a cart-way from the straw-yards, may be appropriated to the hammels. In the usual management of a row of hammels, in Berwickshire, there is one hammel at one end used as a temporary repository for roots and straw for the cattle; then each hammel consists of the open yard, and the covered part; the entrance door, of which there is only one to each hammel, is in the wall of the yard, and on each side of it are two troughs for food, and a crib for hay, straw, cut clover, or other herbage in summer.

Calf-pens, or stages, are common additions to cow-houses. The floor should be made of laths or spars about two inches broad, laid at the distance of an inch from each other, upon joists, so as to make it about ten or twelve inches from the ground: and the place below should be often cleaned. This is the principal suggestion we have to offer: but a slight partition of about three feet high between the calves, and a rack for the hay, are also improvements.

The calf-pens of Gloucestershire, as described by Marshal, are of admirable construction. A pen which holds seven, or occasionally eight calves, is of the following description:—The house or roomstead, in which it is placed, measures twelve feet by eight: four feet of its width are occupied by the stage, and one foot by a trough placed on its front; leaving three feet as a gangway, into the middle of which the door opens. The floor of the stage is formed of laths, about two inches square, lying lengthways of the stage, and one inch asunder. The front fence is of staves, an inch and a half diameter, nine inches from middle to middle, and three feet high: entered at the bottom into the front bearer of the floor (from which cross-joists pass into the back wall), and steadied at the top by a rail; which, as well as the bottom piece, is entered at each end into the end wall. The holes in the upper rail are wide enough to permit the staves to be lifted up and taken out, to give admission to the calves; one of which is fastened to every second stave, by means of two rings of iron joined by a swivel; one ring playing upon the stave, the other receiving a broad leathern collar, buckled round the neck of the calf. The trough is for barley-meal, chalk, &c., and to rest the pails on. Two calves drink out of one pail, putting their heads through between the staves. The height of the floor of the stage from the floor of the room is about one foot. It is thought to be wrong to hang it higher, lest, by the wind drawing under it, the calves should be too cold in severe weather: this, however, might be easily prevented by litter, or long strawy dung thrust

beneath it. It is observable that these stages are fit only for calves which are fed with the pail, not for calves which suck the cow.

Hog-styes are generally constructed with shed-roofs, about six or seven feet wide, with height in proportion. They should be at no great distance from the house; while the less they are connected with the other buildings of the farm the better. Swine, it seems, though generally considered as filthy animals, delight in a clean and comfortable place to lie down in, and cleanliness has a better effect upon no animal, with respect to their thriving. In order to keep them dry, a sufficient slope must be given, not only to the inside places but to the outside areas; these should be a little elevated, having steps up from them of at least five or six inches. Hog-styes should likewise have divisions, to keep the different sorts of swine separate; nor should many ever be allowed to be together.

According to Marshal, every pig should have a rubbing-post. 'Having occasion,' says he, 'to shift two hogs out of a sty without one, into another with a post, accidentally put up to support the roof, he had a full opportunity of observing its use. The animals, when they went in, were dirty, with broken ragged coats, and with dull heavy countenances. In a few days they cleared away their coats, cleaned their skins, and became sleeky haired.' They enjoyed their post like a placeman. It was discernible in their looks, in their liveliness, and apparent contentment. It is not probable that any animal should thrive while afflicted with pain or uneasiness. Graziers suffer single trees to grow, or put up dead posts in the ground, for their cattle to rub themselves against; yet it is probable that a rubbing-post has never been placed intentionally in a sty; though, perhaps, for a two-fold reason, rubbing is most requisite to swine.

'In farm-yards,' says Mr. Loudon, 'the piggeries and poultry-houses generally occupy the south side of the area, in low buildings, which may be overlooked from the farmer's dwelling-house. They should open behind into the straw-yards or dung-heap, to allow the hogs and fowls to pick up the corn left on the straw, or what turnips, clover, or other matters are refused by the cattle. They should have openings outwards, that the pigs may be let out to range round the farmyard at convenient times; and that the poultry may have ingress and egress from that side as well as the other.'

Beaton (Com. to the Board of Ag. vol. 1.), is of opinion that *poultry* ought always to be confined, but not in a close, dark, diminutive hovel, as is often the case; they should have a spacious airy place, properly constructed for them. Some people are of opinion that each sort should be kept by itself. This, however, is not, he thinks, necessary; for all sorts may be kept promiscuously together, provided they have a place sufficiently large to accommodate them, and proper divisions and nests for each kind to retire to separately, which they will naturally do. Wakefield of Liverpool keeps a large stock of turkeys, geese, hens, and ducks, all in the same place; and, although young turkeys are in general considered so difficult to bring up, he rears

great numbers in this manner every season. For this purpose he has about three-quarters, or nearly a whole acre, enclosed with a fence only six or seven feet high, formed of slabs set on end, or any thinnings of fir or other trees split and put close together. They are fastened by a rail near the top and another near the bottom, and are pointed sharp, which he supposes prevents the poultry flying over, for they never attempt it, although so low. Within this fence are places done up slightly (but well secured from wet) for each sort of poultry; also a pond or stream of water running through it. These poultry are fed almost entirely with potatoes boiled in steam, and thrive astonishingly well. The quantity of dung that is made in this poultry place is also an object worth attention: and, when it is cleaned out, a thin paring of the surface is at the same time taken off, which makes a valuable compost, for the purpose of manure. But, for keeping poultry upon a small scale, it is only necessary to have a small shed or slight building, formed in some warm sheltered sunny situation: if near the kitchen or other place where a constant fire is kept so much the better, with proper divisions, boxes, baskets, or other contrivances for the different sorts of birds, and for their laying and incubation.

'The poultry-house should,' says Young, 'contain an apartment for the general stock to roost in, another for setting, a third for fattening, and a fourth for food. If the scale is large, there should be a fifth for plucking and keeping feathers. If a woman is kept purposely to attend them, she should have her cottage contiguous, that the smoke of her chimney may play into the roosting and setting rooms: poultry never thriving so well as in warmth and smoke; an observation as old as Columella, and strongly confirmed by the quantity bred in the smoky cabins of Ireland. For setting both turkeys and hens, nests should be made in lockers, that have lids with hinges, to confine them, if necessary, or two or three will, he says, in sitting, crowd into the same nest. All must have access to a gravelled yard, and to grass for range, and the building should be near the farm-yard, and have clear water near. Great attention should be paid to cleanliness and whitewashing, not for appearance, but to destroy vermin.' Loudon recommends for the interior a sloping stage of spars for the poultry to sit on; 'beneath this stage may be two ranges of boxes for nests; the roof should have a ceiling to keep the whole warm in winter, and the door should be nearly as high as the ceiling for ventilation, and should have a small opening with a shutter at bottom, which, where there is no danger from dogs or foxes, may be left open at all times to admit of the poultry going in and out. The spars on which the clawed birds are to roost should not be round and smooth, but roundish and roughish, like the branch of a tree. The floor must be dry, and kept clean for the web-footed kinds.'

4. *Of the barn.*—Barns should, if possible, be placed on a declivity; and, according to the recommendation of the *Annals of Agriculture*, vol. xvi., should be underpinned with brick or stone; the roof covered with reed or straw; and

Fig. 1.

DOUBLE BARN.

Fig. 2. OPEN BARN.

Fig. 3.

Fig. 4.

Fig. 5.

those of adjoining stables (if any), with slate. At each end of the barn, and over the back door, small doors, four feet square, should be fixed at the height of twelve feet from the ground; the two former for putting corn in at the ends, and the latter for filling the middle of the barn after the bays are full. All the bays should have a floor of clay or marle, and the threshing-floor be made with hard bricks, which will be sufficient for all sorts of grain except wheat and rye; and for threshing them it will be good economy to have planks of oak or red deal well fitted together and numbered, to be laid down occasionally and confined by a frame. A barn built on such a plan would hold a great deal of corn and be filled most conveniently; and, if the stacks were built at each end, they might be taken in without any carting. If more buildings are requisite, two may be added on the back side like the stables in front; otherwise if doors are made under the eaves on the back side, as directed at the ends, and stacks be placed opposite to them just far enough to avoid the eaves dropping, by placing a waggon between them and the barn by way of a stage, these stacks may be taken in without carting; which method spares a great waste of corn and much trouble. The spars of the roofs of the stables rest upon the upper eills of the sides of the barn, and the outside wall of the stables is eight feet high; the barn supplying the highest side and one end of each stable, and the stables in return are buttresses to the barn. An elevated barn floor is both more durable, and less subject to vermin; the grain is kept more dry and sweet than on a ground floor, and cannot slip through it without discovery. When built in this way, barns should have a southern aspect, the arches of the cattle-stalls facing that way. Mr. Marshal, in the *Rural Economy of Yorkshire*, speaks highly of the advantages of barns formed in this manner.

In respect to the size of barns, the same writer observes, that in Gloucestershire fifty-two by twenty feet in the clear, and from sixteen to twenty feet in height to the plate, is considered a good barn; these dimensions admitting of four bays of ten feet each, with a floor in the middle. The advantage of having buildings of this sort conveniently situated is extremely great, both in regard to the feeding of cattle, sheep, and hogs, and likewise in the economy of labor and fodder.

The invention of threshing machines has of late varied the construction of barns, as where they are made use of they should be contrived chiefly with a view to the working of them: the machines being built in the centre, with the grain stacks adjoining them, in such a manner as that they may be supplied without the assistance of carts or horses. The barns in these cases need not be so large, but they should have granaries provided in them, which may probably be most conveniently placed over the floors. In most old barns, threshing machines may be erected without much inconvenience; and notwithstanding the superiority of stacking grain in the open air has been fully shown, and of course the necessity of large barns in a great measure done away, many agriculturors are still attached to the method of housing corn in the straw.

The hay-barn is generally constructed of timber, and open on the south or east, or even on all sides. In Middlesex there are many hay-barns capable of holding from thirty to fifty, and some even 100, loads of hay. They are found to be extremely useful and convenient during a catching and unsettled hay-harvest.

In plate II. *RURAL ARCHITECTURE*, are, fig. 1. The ground plan and elevation of a common double barn: a wall is often run across the middle of these buildings; they are chiefly serviceable for the storage of grain in the straw, and are of all sizes. Fig. 2 is the ground plan and elevation of an open improved barn, the threshing floor of which is towards one end; and on each side of it below are divisions for different purposes: the corn being kept above in the straw. This is an economical and airy building. Figs. 3 and 4 are a front and end elevation of a barn adapted for a two-horse threshing-machine. This barn is fifty-five feet in length within the walls, and seventeen in width. The walls are ten feet high, which admits of a granary or room thirty feet long above the machine, shown by the dotted line in the elevation. The floor is not continued the whole length, in order that there may be more room left in the other end for unthreshed grain, which is introduced at the end. The machine within the barn is only ten feet by seven, including the distance from the wall. The horse beam is twenty-four feet in length, and gives motion by a laying shaft through the wall, to the machine within. There is no shed or cover over the horse-path. The expense of a machine on this plan will be from thirty to forty pounds.

In barns with threshing machines, the granary is almost always formed immediately above the floor on which the machine works; which admits raising the corn to it directly from the ground-floor, either by the threshing-mill itself, or a common windlass. When it is to be taken out, and carried to market, it may be lowered down upon carts with the utmost facility. See our article *GRANARY*.

5. *Of the straw-house, cart-sheds, root-house, &c.*—The straw-house, when distinct from the barn, should be placed at the end of the cattle-sheds, opposite to the root-house, and have a cart entrance, and an inner door communicating with the feeder's walk. Straw, however, is often stacked, in preference to placing it in a straw-house, especially where farming is on any considerable scale.

Cart-sheds or lodges, for the protection of carts or waggons, should be near the farm-yard. Carts, &c., under proper shelter when out of use, will last much longer than if left exposed in the yard to the weather; for, as they are thus sometimes wet, and sometimes dry, they soon rot. The dust and nastiness should also be constantly washed off before they are laid up in these places.

The root-house is intended for depositing or stowing away potatoes, turnips, cabbages, and other roots or tops for the winter feed of cattle. It should join the cattle-sheds, and communicate with them by an inner door that opens into the feeder's walk, and the entrance door ought to admit a loaded cart. These houses seem very

necessary wherever there is a number of cows or other cattle supported on roots or cabbages, as without them it would not only be inconvenient, but in many cases in severe weather impossible to provide for them the daily supply. Cabbages should not, however, be kept long indoors, as they are very liable to the putrid fermentation. The master should be careful that the yard-man constantly keeps such places perfectly clean and sweet, in order that the roots may contract no bad smell, as cattle are in many cases extremely nice in this respect.

The appendages to farm buildings are the dung-yards, pits, and reservoirs, the rick-yard, straw-yard, poultry-yard, drying-yard, garden, orchard, and cottage-yards. These vary so much, according to situation and other circumstances, that a description of them seems needless in this place.

Corn-stands have been of late considered requisite fixtures of a stack-yard; their basements are of timber, masonry, or iron, on which the stack is built, and their object is to keep the lower part dry, and exclude vermin. A usual mode of constructing them is to place a stout

frame of timber on upright stones, two feet high, and having projecting caps of flat stones. They are also constructed wholly of stone, of circular or polygonal walls. In both modes, pieces of timber are placed as a frame in the middle to support the grain upon, and generally a cone of spars in the centre, to form a funnel. Cast iron stands (plate II. fig. 5) for stacks, on pillars about three feet high, and weighing half a hundred weight each, have been introduced with success in some parts of the country. They are made both with and without hollow cones or triangles. A stack requires seven pillars, besides the framing, which may either be made of poles or young trees. In the wet climate of Clackmannanshire wheat has been stacked in five days, beans in eight, and barley and oats in ten days and sometimes earlier. No vermin can find their way into these stacks to consume the grain, and the straw is better preserved. The cone or triangle keeps up a circulation of air, and prevents heating, or other damage. (Gen. Rep. of Scotland, Vol. IV., Appendix p. 379). Hay-stands have been constructed in a similar manner.

RURAL ECONOMY

RURAL ECONOMY. Under this general head we have determined to include those practical parts of the science of agriculture which could not conveniently be embraced in the general article of that name. See AGRICULTURE.

In that article we have taken a general view of soils, and of the ordinary principles of ameliorating them by manuring, ploughing, rotation of crops, &c. In the present paper we propose to treat, 1. Of the arable system. 2. Of grazing. 3. Of the modern convertible system. 4. Of the cultivation of plants that are articles of commerce. 5. Of the management of live stock. 6. Of implements of husbandry. The dairy, and its general economy, have engaged our attention under the article DAIRY.

PART I.

OF THE ARABLE SYSTEM.

In laying out a farm on the arable system, it has been recommended that attention be paid to that course of crops, which the quality of the soil may point out; and that, upon all farms not below a medium size, there should be twice the number of enclosures that there are divisions or breaks in the course. Thus, if a six years' rotation be thought most profitable, there should be twelve enclosures, two of which are always under the same crop. One advantage in this arrangement is, that it tends greatly to equalize labor, and, with a little attention, may contribute much to equalise the produce. On large farms, where all the land under turnips and clover, for instance, is near the extremity of the grounds, or at a considerable distance from the buildings, supposed to be set down near the centre, it is clear that the labor of supplying the house and straw-yard stock with these crops, as well as the carriage of the manure to the field, is much greater than if

the fields were so arranged as that the half of each of these crops had been near the offices. But, by means of two fields for each crop in the rotation, it is quite easy to connect together one field near the houses with another at a distance; thus having a supply at hand for the home stock, while the distant crops may be consumed on the ground. The same equalisation of labor should be observed in the cultivation of the corn fields, and in harvesting the crops. By this kind of arrangement a field of inferior soil may be so connected with one that is naturally rich, that the former may be gradually brought up in produce towards the level of the latter, without any injury. For instance, a field under turnips may be so fertile that it would be destructive to the succeeding corn crop to consume the whole or the greater part on the ground; while another may be naturally so poor, or so deficient in tenacity, as to make it inexpedient to spare any part for consumption elsewhere. By connecting these two under the same crop,—by carrying from the one what turnips are wanted for the feeding-houses and straw-yards, and eating the whole crop of the other on the ground with sheep, the ensuing crop of corn will not be so luxuriant on the former as to be unproductive, while the latter will seldom fail to yield abundantly.

1. In *preparing land* for cropping, the first thing that occurs is to consider the obstructions to regular ploughing. The most formidable of these are stones lying above or below the surface. Stones above the surface may be avoided by the ploughman, though not without loss of ground; but stones below the surface are commonly not discovered till the plough is shattered to pieces, and perhaps a day's work lost. The clearing land of stones is therefore necessary to prevent mischief. And, to encourage the operation, it is

attended with much actual profit. In the first place, the stones are often useful for fences: when large they must be blown, and are commonly proper for building. And, as the blowing with gunpowder does not exceed a halfpenny for each inch that is bored, these stones come generally cheaper than to dig as many out of the quarry. 2dly, As the soil round a large stone is commonly the best in the field, it is purchased at a low rate by taking out the stone; for not only is the ground lost that is occupied by a large stone, but also a considerable space round it, to which the plough has not access without danger. A third advantage is that the plowing can be carried on with much expedition, when there is no apprehension of stones: in stony land, the plough must proceed so slow, as not to perform half of its work.

But to clear land of stones is an undertaking too expensive for a tenant who has not a long lease. As it is, however, so important both to him and to his landlord, it appears reasonable that the expense should be divided, where the lease does not exceed nineteen or twenty years. It falls naturally upon the landlord to be at the expense of blowing the stones, and upon the tenant to carry them off the field.

Another obstruction is wet ground. Water may improve gravelly or sandy soils; but it sours a clay soil, or renders it unfit for vegetation, and converts low ground into a morass. A great deal has been written upon different methods of draining land. See DRAINING. One way of draining without expense, when land is to be enclosed with hedge and ditch, is to direct the ditches so as to carry off the water. But this method is not always practicable. If the run of water be considerable, it will destroy the ditches, and lay open the fences, especially where the soil is loose or sandy. If ditches will not answer, hollow drains are sometimes made, and sometimes open drains, made so deep as to command the water. The former is filled up with loose stones, with brush-wood, or with any other porous matter that permits the water to pass. The latter is left open. To make the former effectual, the ground must have such a slope as to give the water a brisk course. To attempt to execute them in a level ground is an error; the passages are soon stopped up with sand and sediment, and the work is rendered useless. This inconvenience takes not place in open drains; but they are subject to other inconveniences. They are always filling up, and make a yearly reparation necessary; and they obstruct both ploughing and pasturing.

The following open drain is one of the best. It is made with the plough, cleaving the space intended for the drain over and over, till the furrow be made of a sufficient depth for carrying off the water. The slope on either side may, by repeated ploughings, be made so gentle as to give no obstruction either to the plough or to the harrow. There is no occasion for a spade, unless to smooth the sides, and to remove accidental obstructions in the bottom. This drain is executed at much less expense than either of the former; and it is perpetual, as it can never be obstructed. In level ground indeed grass may

grow at the bottom, but to clear off the grass once in four or five years will restore it to its original perfection. A hollow drain may be proper between the spring-head and the main drain, where the distance is not great; but in every other case the drain recommended is the best. Where a level field is infested with water from higher ground, the water ought to be intercepted by a ditch carried along the foot of the high ground, and terminating in some capital drain. The only way to clear a field of water that is hollow in the middle is to carry it off by some drain still lower.

A clay soil of any thickness is often pestered with rain, which settles on the surface. The only remedy is high narrow ridges, well rounded. And, to clear the furrows, the furrow of the foot-ridge ought to be considerably lower, to carry off the water cleverly. It cannot be made too low, as nothing hurts clay soil more than the stagnation of water on it. Some gravelly soils have a clay bottom; which is a substantial benefit to a field when in grass, as it remains moister. But, when in tillage, ridges are necessary to prevent rain from settling at the bottom; and this is the only case where a gravelly soil ought to be ridged. Clay soils that have little or no level have sometimes a gravelly bottom. For discharging the water, the best method is, at the end of every ridge to pierce down to the gravel, which will absorb the water. But if the furrow of the foot-ridge be low enough to receive all the water it will be more expeditious to make a few holes in that furrow. In some cases, a field may be drained, by filling up the hollows with earth from higher ground. But, as this method is expensive, it will only be taken where no other method answers. Where a field happens to be partly wet, partly dry, there ought to be a separation by a middle ridge, if it can be done conveniently; and the dry part may be ploughed while the other is drying.

Some of the low parts of Scotland are of a brick clay soil, extremely wet in winter. This in a good measure may be prevented by proper enclosing, as there is scarcely a field but can be drained into lower ground. But as this would lessen the quantity of rain in a dry climate, such as is all the east side of Britain, it may admit of some doubt whether the remedy would not be as bad as the disease.

To improve a moor, let it be opened in winter when it is wet; and when the plough cannot be employed at any other work. In spring, after frost is over, a slight harrowing will fill up the seams with mould, to keep out the air, and rot the sod. In that state let it lie the following summer and winter, which will rot the sod more than if laid open to the air by ploughing. Next April, let it be cross-ploughed, broken, and harrowed, till it be sufficiently pulverised. Let the manure laid upon it, whether lime or dung, be intimately mixed with the soil by repeated harrowings. This will make a fine bed for turnip seed if sown broad-cast. But, if drills be intended, the method must be followed that is directed afterward in treating of the culture of turnip. A successful turnip-crop, fed on the ground by sheep, is a fine preparation for laying

down a field with grass seeds. It is an improvement upon this method, to take two or three successive crops of turnip, which will require no dung for the second and following crops. This will thicken the soil, and enrich it greatly.

The best way of improving *swampy ground*, after draining, is paring and burning. But where the ground is dry, and the soil so thin as that the surface cannot be pared, the way of bringing it into tilth from the state of nature is to plough it with a feathered sock, laying the grassy surface under. After the new surface is mellowed with frost, fill up all the seams by harrowing cross the field, which by excluding the air will effectually rot the sod. In this state let it lie summer and winter. In the beginning of May after, a cross-ploughing will reduce all to small square pieces, which must be pulverised with the brake, and made ready for a May or June crop. If these square pieces be allowed to lie long in the sap without breaking, they will become tough and not be easily reduced.

On the subject of *paring and burning*, Mr. Loudon says, 'The season for this operation is April, May, and June: the particular period must, however, always depend much on the state of the weather and the nature of the crop. When the east winds prevail, in February and March, this sort of business may sometimes be carried on. But for accomplishing the work with the greatest despatch, and also with the least trouble and expense, a dry season is obviously the best. The prudent cultivator should not embark in the undertaking unless there be a reasonable probability of his accomplishing it while the weather keeps dry and favorable. The latter end of May or the beginning of June, when the hurry of the spring-seed time is over, in the more northern districts, when a number of hands can be most easily procured may, upon the whole, be considered as the best and most convenient season; as at this period the green vegetable products are in their most succulent state, and of course may probably afford more saline matter; but in the more southern counties either a much earlier season must be taken, or the interval between the hay season and the harvest time must be fixed upon, the latter of which is, on the principle just stated, evidently the best, where the extent of ground to be burnt is not too large. In other seasons it would frequently be impossible to procure a sufficient number of hands for performing the business. In bringing waste lands into cultivation, where an extensive tract of ground is to undergo this process, the autumn may, in many cases, afford a convenient opportunity for the operation. A good deal depends on the crops that are to be sown after paring and burning. When rape or turnips are to be cultivated, the end of May, or the beginning of June, will be the most proper time; but, if barley or oats are to be sown, the paring and burning must be completed as early in spring as the nature of the season will admit; and, when lands are pared and burned as a preparation for a crop of wheat, July, or even the beginning of August, may, in favorable seasons, answer; but it is better to have the ground ready sooner if possible. In respect to the depth to which lands of different

qualities may be pared with the most advantage, it is obvious that, as it can hardly be proper to pare light, thin-stapled soils, to the same depths as those of the more deep and heavy kinds, it should, in some degree, be regulated by their particular nature, and their differences in respect to heaviness. Boys, who is in the habit of breaking up thin chalky soils, and such as have been in tillage, in this way, observes that in Kent, where the method of paring most in use is with down-shares or breast ploughs, they take off turfs as thick as the nature of the soil will admit, from half an inch to two inches; the thicker the better, provided there be a sufficient portion of vegetable matter contained within them to make them burn well. The most usual depths of paring are from about one to three inches.

'In regard to burning, when the season is not very wet, the turfs will commonly be sufficiently dried in about a fortnight or three weeks, even without being turned; but in rainy weather they require a longer time, and must be turned more than once to prevent their striking out roots and shoots, which might hinder them from burning. As soon as the turfs have fully undergone the process of burning, and are reduced to the state of ashes and a powdery earthy matter, the whole should, as soon as possible, be spread out over the land in as regular and equal a manner as the nature of the work will admit of; for, without great attention in this respect, great inequality in the crops may take place; besides the soil will be made lighter in some places than in others, which may be disadvantageous in the same way. The spreading, where it can by any means be accomplished, should always be performed before any rain falls; as, where this point is not attended to, a great loss may be sustained by the saline matters being carried down in a state of solution, and their beneficial effects in a great measure lost before the crops are in a condition to receive them. In order to secure the full influence of the ashes, the land is frequently slightly ploughed over immediately after the ashes are spread out. And it is stated by Donaldson that those who are more than ordinarily attentive in this respect only rib or slob furrow the field, so that the ashes after burning may be covered up with the greater expedition and despatch. By this mode they cannot probably, however, be so equally mixed with the soil as by that of ploughing the whole field with a very slight furrow, so as just to cover them. The expense of the operation of paring and burning will vary according to the nature and situation of the land, the method in which it is performed, and the customs of the district in regard to the price of labor. On the thin sort of chalky soils it is stated by Boys that the expense for paring at a moderate thickness, where the land is not very flinty, is about equal to four or five ploughings.'

We add this writer's remarks on *the operation of drying and burning clay for manure*, as it is in several respects similar to that of paring and burning. 'The practice of burning clay,' he observes, 'has at various times been pursued with energy and success, and at other times has fallen

into neglect. The oldest book in which it is mentioned is probably *The Country Gentleman's Companion*, by Stephen Switzer, gardener, London, 1732. In that work it is stated that the earl of Halifax was the inventor of this useful improvement; and that it was much practised in Sussex. There are engravings of two kilns for burning clay, one adopted in England, and the other in Scotland; where it is said to have been ascertained that lands, reduced by tillage to poverty, would produce an excellent crop of turnips if the ground were ploughed two or three times, and clay ashes spread over it. In the same work there are several letters, written in the years 1730 and 1731, stating that the plan of burning clay had answered in several parts of England; and accounts were received from Scotland that, upon experiment, it had answered better than either lime or dung, but was found too expensive. The practice is described at length in *Ellis's Practical Farmer*, or *Hertfordshire Husbandman*, 1732. In 1786 James Arbuthnot, of Peterhead, tried several successful experiments with burning clay, and various others have since been made in different parts of the empire. In 1814 the practice was revived and written on by Craig, of Callay, near Dumfries, and soon after by general Beatson, near Tunbridge; by Curwen, Burrows, and several correspondents of agricultural journals. In Ireland, it would appear, the practice prevails in several places, and Craig says he adopted it from seeing its effects there. The result of the whole is, that the benefits of this mode of manuring have been greatly exaggerated; though they certainly appear to be considerable on clayey soils. Aiton (*Farmer's Magazine*, vol. xxii. p. 423) compares this rage for burning clay, which existed in 1815, to the florin mania of a few years prior date. In 1822 he found few of the advocates for these improvements disposed to say much on the subject, and saw very few clay kilns smoking. 'To give my ultimatum upon this subject,' he says, 'I regret that the discoverers of florin grass, and of the effects of burnt clay, have so far overrated their value. Both are useful and proper to be attended to;—the grass to be raised on patches of marshy ground, and used as green food to cattle in winter; and the burnt earth as a corrector of the mechanical arrangement of a stubborn clay soil; and I have no doubt but if they had been only recommended for those valuable purposes they would have been brought into more general use than they yet are or will be, till the prejudice against them, arising from the disappointment of expectations raised high by too flattering descriptions, are removed.' He thus describes the action of burnt clay:—'It must be obvious to every person that has paid attention to the subject, that when clay, or other earth, is burnt into ashes like brick-dust, it will not (unless acids be applied to it) return again to its former state of clay, but will remain in the granulated state of ashes or friable mould, to which it was reduced by the operation of burning. An admixture of this kind, with a strong adhesive clay, must evidently operate as a powerful manure by changing the mechanical arrangement of the latter and rendering it more

friable; giving greater facility to the protection of redundant moisture, and to the spreading of the roots of vegetables in quest of food. The application of as much water, sand, or any similar substance, would have exactly the same effect in opening, and keeping open, the pores of an adhesive clay soil, and converting it into the quality loam. Besides this, which would be a permanent improvement upon the staple or texture of every clay soil, burnt clay or torrefied earth may sometimes acquire, in this operation, a small quantity of soot or carbonic matter, that may, in favorable circumstances, operate for one season as a manure, or as a stimulus to a small extent to the growth of vegetables. This at least may be the case if the clay or earth burnt shall abound with vegetable matter, and if the burning is conducted in such a smothered way as to prevent the smoke or vegetable matter from escaping. But as it is the subsoil that is recommended, and seems to be generally used for burning, it is impossible any considerable quantity of vegetable matter can be found in it. The calcareous matter in the soil, it is said, will be calcined and formed into lime by the operation of burning. But I am disposed to consider this argument as far more plausible than solid. Calcareous matter is no doubt found, on chemical analysis, to a certain extent in some soils; perhaps some perceptible portion of it may be found in every soil. But it is seldom or never found in any soil to such an extent as to be of much use as a manure to other land. Even when the soil is impregnated with a large portion of calcareous matter, if it is not in the form of limestone, but minutely mixed with it, the burning cannot either increase or much alter the lime. If it is in the form of stones, however small, or in what is called limestone gravel, there is little chance of its being calcined in the operation of burning the clay; it would go through that ordeal unaltered. Any change, therefore, that can be made upon the small portion of calcareous matter in the soil, by burning in the manner directed, can scarcely have any perceptible effect when that matter is applied as manure to other soils. And though it is possible that some qualities in particular soils, unfavorable to vegetation, may be corrected by burning, and that in some other instances the fire may render the clay more nutritive to plants (though I have not been able to trace this, or even to conjecture how it can happen), yet I am much disposed to believe that its effect as a mechanical mixture in opening the pores of the soil is the chief improvement that can be derived from the application of burnt clay as a manure. If it has any other effect it must be from the soot or carbonic matter collected during the operation of burning; or perhaps it may acquire by the torrefaction somewhat of a stimulating quality, that may for a short time promote the growth of particular plants. But these qualities can only be to a small extent, and continue to act for a very limited period.'—*Far. Mag.* xxii. 422.

According to a writer in the *Farmer's Journal* the action of burnt clay is at least three-fold, and may be manifold. It opens the texture of stubborn clays, gives a drain to the water, spirals

cles to the air, and affords to the roots facility of penetrating. Clay ashes burned from turves, containing an admixture of vegetable matter, consist, in some small proportion, of vegetable alkali, or potassa, a salt which is known to be a good manure. It also, in most cases, happens, that a stiff cold clay is impregnated with pyrites, a compound of sulphuric acid and iron. Although the chemical attraction between these two bodies is so strong that it is one of the most difficult operations in the arts totally to free iron from sulphur, yet a very moderate heat sublimates a large portion of the sulphur. The iron is then left at liberty to re-absorb a portion of the redundant sulphuric acid, which too generally is found in these soils, and thereby sweetens the land; and it is probable that the bright red, or crimson calx of iron, which gives coloring to the ashes when over burnt, is beneficial to vegetation in the present case, inasmuch as it is, of itself, one of the happiest aids to fertility, as is exemplified in the red marl strata, and red sand strata throughout the kingdom. The evolution and recombination of different gases, no doubt, materially affect the question; but it is reserved for accurate chemical observers to give us an account of the processes which take place in this respect. Curwen notices that clay ashes do no benefit as a top dressing on grass, which is in part to be explained by reason that the ashes, when spread on the surface of the grass, cannot exert the mechanical action on the soil in the ways enumerated. Neither can the calx of iron come so immediately in contact with the particles of the soil, for the producing of any chemical effect, as it would do if the ashes were ploughed in. In short, like many other manures which are laid on the surface, unless it contains something soluble which may be washed into the ground by rains, it does very little good; and the feeble proportion of vegetable alkali is probably the only soluble matter the ashes contain. However sanguine may be the admirers of burnt clay, all experience confirms that the most beneficial clay-ashes are those which are burnt from the greatest proportion of rich old turf, ancient banks, roots of bushes, and other vegetable matters; and I conceive the value of mere powdered pottery (for such it is) may easily be overrated.—*Far. Journ.* 1819.

The common method of burning clay is thus described by Mr. Loudon. An oblong enclosure, of the dimensions of a small house (say fifteen feet by ten), is made of green turf sods, raised to the height of three and a half or four feet. In the inside of this enclosure, air-pipes are drawn diagonally, which communicate with holes left at each corner of the exterior wall. These pipes are formed of sods put on edge, and the space between these so wide only as another sod can easily cover. In each of the four spaces left between the air-pipes and the outer wall, a fire is kindled with wood and dry turf, and then the whole of the inside of the enclosure or kiln filled with dry turf, which is very soon on fire; and on the top of that, when well kindled, is thrown the clay, in small quantities at a time, and repeated as often as necessary, which must be regulated by the intensity of the burning. The

air-pipes are of use only at first, because, if the fire burns with tolerable keenness, the sods forming the pipes will soon be reduced to ashes. The pipe on the weather side of the kiln only is left open, the mouths of the other three being stopped up, and not opened, except the wind should veer about. As the inside of the enclosure, or kiln, begins to be filled up with clay, the outer wall must be raised in height, always taking care to have it at least fifteen inches higher than the top of the clay, for the purpose of keeping the wind from acting on the fire. When the fire burns through the outer wall, which it often does, and particularly when the top is overloaded with clay, the breach must be stopped up immediately, which can only be effectually done by building another sod wall from the foundation, opposite to it, and the sods that formed that part of the first wall are soon reduced to ashes. The wall can be raised as high as may be convenient to throw on the clay, and the kiln may be increased to any size, by forming a new wall when the previous one is burnt through. The principal art consists in having the outer wall made quite close and impervious to the external air, and taking care to have the top always lightly, but completely covered with clay; because, if the external air should come in contact with the fire, either on the top of the kiln, or by means of its bursting through the sides, the fire will be very soon extinguished. In short, the kiln requires to be attended to nearly as closely as charcoal pits. Clay is much easier burnt than either moss or loam;—it does not undergo any alteration in its shape, and on that account allows the fire and smoke to get up easily between the lumps; whereas moss and loam, by crumbling down, are very apt to smother the fire, unless carefully attended to. No rule can be laid down for regulating the size of the lumps of clay thrown on the kiln, as that must depend on the state of the fire; but I have found every lump completely burnt on opening the kiln; and some of them were thrown on larger than my head. Clay, no doubt, burns more readily if it be dug up and dried for a day or two before it be thrown on the kiln; but this operation is not necessary, as it will burn though thrown on quite wet. After a kiln is fairly set a going, no coal or wood, or any sort of combustible is necessary, the wet clay burning of itself, and it can only be extinguished by intention, or the carelessness of the operator,—the vicissitudes of the weather having hardly any effect on the fire, if properly attended to. It may, perhaps, be necessary to mention that, when the kiln is burning with great keenness, a stranger to the operation may be apt to think that the fire is extinguished. If, therefore, any person, either through impatience, or too great curiosity, should insist on looking into the interior of the kiln, he will certainly retard, and may possibly extinguish the fire; for, as before mentioned, the chief art consists in keeping out the external air from the fire. Where there is abundance of clay, and no great quantity of green turf, it would perhaps be best to burn the clay in draw-kilns the same as lime.

Colonel Dickson, at Hexham, and other gentlemen of Northumberland, instead of building a

kiln use gratings or arches of cast iron, to form a vault or funnel for the fuel, and over this funnel the clay is built. The grated arches are made about two feet and a half long, two feet diameter, and about fourteen inches high. One grating is to be filled with brushwood, stubble, or any other cheap fuel, and the clay, as it is dug, built upon it to a convenient height, leaving small vacancies, or boring holes, to allow the heat to penetrate to the middle and outer parts of the clay. When a sufficient quantity is built upon the first grating, another is added at either or both ends, filled with similar fuel, and the clay built upon them as before. This process is continued until ten, twelve, or a greater number of the gratings have been used, when one end is built up or covered with clay, and at the other, under the last grating, a fire is made of coals or faggot wood. The end at which the fire is made should face the wind if possible, and if the process has been properly conducted the clay will be effectually burnt. By commencing with a centre grating, in the form of a cross, the workman may build from four ends in the place of two; this contrivance will afford a facility in the work, and have a draft of wind at two entrances. The advantage of this mode of burning clay is the saving of cartage, as the clay may be always burned where it is dug.

Mr. Curwen has practised burning clay and surface soil by lime without fuel (*Farm. Mag.* vol. xvi. p. 11, 12), in the following manner:—Mounds of seven yards in length, three and a half in breadth, are kindled with seventy-two Winchester bushels of lime. First, a layer of dry sods or parings, on which a quantity of lime is spread, mixing sods with it; then a covering of eight inches of sods, on which the other half of the lime is spread, and covered a foot thick: the height of the mound being about a yard. In twenty-four hours it will take fire. The lime should be immediately from the kiln. It is better to suffer it to ignite itself, than to effect it by operation of water. When the fire is fairly kindled, fresh sods must be applied. Mr. Curwen recommends obtaining a sufficient body of ashes before any clay was put on the mounds. The fire naturally rises to the top. It takes less time, and does more work to draw down the ashes from the top, and not to suffer it to rise above six feet. The former practice of burning in kilns was more expensive; did much less work; and, in many instances, calcined the ashes, and rendered them of no value.

2. *Of ridges.*—The first thing is to consider what grounds ought to be formed into ridges, and what ought to be tilled with a flat surface. Dry soils, which suffer by want of moisture, ought to be tilled flat, to retain moisture. The method for such tilling is to go round from the circumference to the centre, or from the centre to the circumference. This method is advantageous in point of expedition, as the whole is finished without once turning the plough. At the same time, every inch of the soil is moved, instead of leaving either the crown or the furrow unmoved, as is commonly done in tilling ridges. Clay soil, which suffers by water standing on it, ought to

be laid as dry as possible by proper ridges. A loamy soil is the medium between these two. It ought to be tilled flat in a dry country, especially if it incline to the soil first mentioned. In a moist country, it ought to be formed into ridges, high or low according to the degree of moisture and tendency to clay.

In grounds that require ridging, an error prevails, that ridges cannot be raised too high. But high ridges labor under several disadvantages. The soil is heaped upon the crown, leaving the furrows bare; the crown is too dry, and the furrows too wet; the crop, which is always best on the crown, is more readily shaken with the wind, than where the whole crop is of an equal height; the half of the ridge is always covered from the sun, a disadvantage which is far from being slight in a cold climate. High ridges labor under another disadvantage; in ground that has no more level than barely sufficient to carry off water, they sink the furrows below the level of the ground; and consequently retain water at the end of every ridge. The furrows ought never to be sunk below the level of the ground. Water will more effectually be carried off by lessening the ridges both in height and breadth; a narrow ridge the crown of which is but eighteen inches higher than the furrow, has a greater slope than a very broad ridge where the difference is three or four feet.

In forming ridges, where the ground hangs considerably, they may be too steep as well as too horizontal; and, if to the ridges be given all the steepness of a field, a heavy shower may do irreparable mischief. To prevent this the ridges ought to be so directed cross the field as to have a gentle slope, for carrying off water slowly, and no more. In that respect, a hanging field has greatly the advantage of one that is nearly horizontal; because, in the latter, there is no opportunity of a choice in forming the ridges. A hill is of all ground the best adapted for directing the ridges properly. If the soil be gravelly, it may be ploughed round and round, beginning at the bottom and ascending gradually to the top in a spiral line. This method of ploughing a hill, requires no more force than ploughing on a level; and removes the great inconvenience of a gravelly hill, that rains go off too quickly; for the rain is retained in every furrow. If the soil be such as to require ridges, they may be directed to any slope that is proper.

To form a field into ridges, that has not been formerly cultivated, the rules mentioned are easily put in execution. After seeing the advantage of forming a field into ridges, people were naturally led into an error, that the higher the better. But the practice of making their ridges crooked certainly did not originate from design, but from the laziness of the driver suffering the cattle to turn, instead of making them finish the ridge without turning. There is more than one disadvantage in this slovenly practice. First, the water is kept in by the curve at the end of every ridge, and sours the ground. Secondly, as a plough has the least friction possible in a straight line, the friction must be increased in a curve, the back part of the mould-board pressing hard on the one hand, and the

coulter pressing hard on the other. Thirdly, the plough moving in a straight line has the greatest command in laying the earth over. But, where the straight line of the plough is applied to the curvature of a ridge to heighten it by gathering, the earth moved by the plough is continually falling back, in spite of the most skilful ploughman.

The inconveniences of ridges high and crooked are so many that one would be tempted to apply a remedy at any risk. And yet, if the soil be clay, it would not be advisable for a tenant to apply the remedy upon a lease shorter than two nineteen years. In a dry gravelly soil, the work is not difficult or hazardous. When the ridges are cleaved two or three years successively in the course of cropping, the operation ought to be concluded in one summer. The earth, by reiterated ploughings, should be accumulated upon the furrows, so as to raise them higher than the crowns; they cannot be raised too high, for the accumulated earth will subside by its own weight. Cross ploughing, once or twice, will reduce the ground to a flat surface, and give opportunity to form ridges at will. The same method brings down ridges in clay soil: only let the work be carried on with expedition; because a hearty shower, before the new ridges are formed, would soak the ground in water, and make the farmer suspend the work for the remainder of that year at least. In a strong clay, the ridges should not be altered, unless it can be done to perfection in one season. On this subject Dr. Anderson has said, 'The difficulty of performing this operation properly with the common implements of husbandry, and the obvious benefit that accrues to the farmer from having his fields level, has produced many new inventions of ploughs, harrows, drags, &c., calculated for speedily reducing the fields to that state; none of which have as yet been found fully to answer the purpose for which they were intended, as they all indiscriminately carry the earth that was on the high places into those that were lower; which, although it may, in some cases, render the surface of the ground tolerably smooth and level, is usually attended with inconveniences far greater, for a considerable length of time, than that which it was intended to remove. For experience sufficiently shows that even the best vegetable mould, if buried for any length of time so far beneath the surface as to be deprived of the benign influences of the atmosphere, becomes an inert lifeless mass, little fitted for nourishing vegetables; and constitutes a soil very improper for the purposes of the farmer. It therefore behoves him to preserve, on every part of his fields, an equal covering of that vegetable mould that has long been uppermost, and rendered fertile by the meliorating influence of the atmosphere. But if he suddenly levels his high ridges, by any of these mechanical contrivances, he buries all the good mould that was on the top of the ridges in the old furrows, by which he greatly impoverishes one part of his field, while he too much enriches another, and he has the mortification frequently to see the one half of his crop rotted by an over-luxuriance, while other parts of it are weak and sickly, or one part ripe and ready for reaping, while the other is not properly filled.

'On these accounts, if the farmer has not a long lease, it will be in general much his interest to leave the ridges as he found them, rather than to attempt to alter their direction; and, if he attends with due caution to moderate the height of these ridges, he may reap very good crops. But, where a man is secure of possessing his ground for any length of time, the advantages that he will reap from having level and well laid out fields are so considerable as to be worth purchasing, if it should even be at a considerable expense. But the loss that is sustained at the beginning by this mechanical mode of levelling ridges, if they are of considerable height, is so very great, that it is doubtful if any future advantages can fully compensate it. I would therefore advise that all this levelling apparatus should be laid aside, and the following more efficacious practice be substituted in its stead: a practice that I have long followed with success, and can safely recommend as the very best that has yet come to my knowledge.

'If the ridges have been raised to a very great height, as a preparation for the ensuing operations, they may be first cloven, or scalded out, as it is called, that is, ploughed so as to lay the earth on each ridge from the middle towards the furrows; but, if they are only of a moderate degree of height, this operation may be omitted. When you mean to proceed to level the ground, let a number of men be collected, with spades, more or fewer as the nature of the ground requires, and then set a plough to draw a furrow directly across the ridges of the whole field intended to be levelled. Divide this line into as many parts as you have laborers, allotting to each one ridge or two, more or less, according to their number, height, and other circumstances. Let each of the laborers, as soon as the plough has passed that part assigned him, begin to dig in the bottom of the furrow that the plough has just made, about the middle of the side of the old ridge, keeping his face towards the old furrow, working backwards till he comes to the height of the ridge, and then turn towards the other furrow, and repeat the same on the other side of the ridge, always throwing the earth that he digs up into the deep old furrow between the ridges that is directly before him; taking care not to dig deep where he first begins, but to go deeper and deeper as he advances to the height of the ridge, so as to leave the bottom of the trench he thus makes across the ridge entirely level, or as nearly so as possible. And when he has finished that part of the furrow allotted to him that the plough has made in going, let him then finish in the same manner his own portion of the furrow that the plough makes in returning. In this manner each man performs his own task through the whole field, gradually raising the old furrows as the old heights are depressed. And if an attentive overseer is at hand, to see that the whole is equally well done, and that each furrow is raised to a greater height than the middle of the old ridges, so as to allow for the subsiding of that loose earth, the operation will be entirely finished at once, and never again need to be repeated.

'In performing this operation, it will always be proper to make the ridges formed for the

purpose of levelling, which go across the old ridges, as broad as possible; because the deep trench that is thus made in each of the furrows is an impediment in the future operations, as well as the height that is accumulated in the middle of each of these ridges; so that the fewer there are of these the better. The farmer, therefore, will do well to advert to this, and begin by forming a ridge by always turning the plough to the right hand, till it becomes of such breadth as makes it very inconvenient to turn longer in that manner; and then, at the distance of twice the breadth of this new-formed ridge from the middle of it, mark off a furrow for the middle of another ridge, turning round it to the right hand, till it becomes of the same breadth, and then, turning to the left hand, plough out the interval that was left between the two new-formed ridges. By this mode of ploughing, each ridge may be made of forty, or fifty, or sixty yards in breadth, without any great inconvenience; for, although some time will be lost in turning at the ends of these broad ridges, yet, as this operation is only to be once performed in this manner, the advantage that is reaped by having few open furrows is more than sufficient to counterbalance it. To moderate the height that would be formed in the middle of each of these great ridges, it will be proper to mark out the ridges, and draw the furrow that is to be the middle of each some days before you collect your laborers to level the field, that you may, without any hurry or loss of labor, clear out a good trench through the middle of each of the old ridges; as the plough at this time, going and returning nearly in the same track, prevents the laborers from working properly without this precaution. If these rules are attended to, your field will be at once reduced to a proper level, and the rich earth that formed the surface of the old ridge be still kept upon the surface of your field; so that the only loss that the possessor of such ground can sustain by this operation is merely the expense of performing it.

Dr. Anderson afterwards makes a calculation of the different expenses of levelling by the plough and by the spade, in which he finds the latter by far the cheapest method. It should be a rule, according to him, to direct the ridges north and south if the ground will permit. In this direction, the east and west sides of the ridges, dividing the sun equally between them, will ripen at the same time. It is a great advantage to form ridges so narrow and so low as to admit the crowns and furrows to be changed alternately every crop. The soil nearest the surface is the best; and, by such ploughing, it is always kept near the surface, and never buried. In high ridges the soil is accumulated at the crown, and the furrows left bare. Such alteration of crown and furrow is easy, where the ridges are only seven or eight feet broad. This mode of ploughing answers perfectly well in sandy and gravelly soils, and even in loam; but it is not safe in clay soil. In that soil the ridges ought to be twelve feet wide, and twenty inches high; to be preserved always in the same form by casting, that is, by ploughing two ridges together, beginning at the furrow that separates

them, and ploughing round and round till the two ridges be finished. By this method, the separating furrow is raised a little higher than the furrows that bound the two ridges. But at the next ploughing that inequality is corrected, by beginning at the bounding furrows, and going round and round till the ploughing of the two ridges be completed at the separating furrow.

For cleaning the ground of weeds, a cleaning harrow is often used. It is drawn by a single horse, directed by reins, which the man at the opposite corner puts over his head, to have both hands free. In this corner is fixed a rope, with which the man from time to time raises the harrow from the ground, to let the weeds drop. For the sake of expedition, the weeds ought to be dropped in a straight line cross the field, whether the harrow be full or not; and seldom is a field so dirty but that the harrow may go thirty yards before the teeth are filled. The weeds will be thus laid in parallel rows, like those of hay raked together for drying. A harrow may be drawn swiftly along the rows, to shake out all the dust; and then the weeds may be carried clean off the field in carts. But, instead of burning them, they may be converted into useful manure, by laying them in a heap, with a mixture of hot dung to begin fermentation. At first view, this way of cleaning land will appear operose; but neither the labor nor expense is immoderate. At any rate, these ought not to be grudged; for, if a field be once thoroughly cleaned, the seasons must be very cross, or the farmer very indolent, to make it necessary to renew the operation in less than twenty years. In the worst seasons a few years' pasture is always under command; which effectually destroys triennial plants, such as whistles and couch-grass.

3. We may here offer a few remarks of a practical kind on soils:—i. *Clay* is in general the stiffest of all soils, and contains an unctuous quality. See *CLAY*. But, under the term clays, earths of different sorts and colors are included. One kind is so obstinate that scarcely any thing will subdue it; another is so hungry and poor that it absorbs whatever is applied, and turns it into its own quality. Some clays are fatter than others, and the fattest are the best; some are more soft and slippery. But all of them retain water poured on their surfaces, where it stagnates, and chills the plants, without sinking into the soil. The closeness of clay prevents the roots and fibres of plants from spreading in search of nourishment. The blue, the red, and the white clay, if strong, are unfavorable to vegetation. The stony and looser sort are less so; but none of them are worth any thing till their texture is so loosened by a mixture of other substances, and opened, as to admit the influence of the sun, the air, and frost. Among the manures recommended for clay, sand is of all others to be preferred: and sea-sand the best of all, as it most effectually breaks the cohesion. It is preferred, because it is not formed wholly of small stones; but contains a great deal of calcareous matter, such as, shells grated and broken to pieces by the tide; and also salts. The smaller the sand is the more easily it penetrates the clay; but it abides less time in it than the larger. The next best

sand is that washed down by rains on gravelly soils. Those which are dry and light are the worst. Small gritty gravel has also been recommended by the best writers on agriculture, for these soils; and in many instances they have answered the purpose. Shells, marle, ashes, and all animal and vegetable substances, are very good manures for clay; but they have been found most beneficial when sand is mixed with them. Lime has been often used, but eminent agriculturists have found no advantage from it singly, when applied to clays. The crops most suitable for such lands are, wheat, beans, cabbages, and rye-grass. Clover seldom succeeds, nor indeed any plants whose roots require depth, and a wide spread in the earth.

ii. *Chalk*.—Chalky soils are generally dry and warm, and, if there be a tolerable depth of mould, fruitful; producing great crops of barley, rye, peas, vetches, clover, trefoil, burnet, and particularly sainfoin. The latter plant flourishes in a chalky soil better than any other. But, if the surface of mould be very thin, this soil requires good manuring with clay, marl, loam, or dung. As these lands are dry, they may be sown earlier than others. When barley is three inches high, throw in 10 lbs. of clover, 15 lbs. of trefoil, and roll it well. The next summer mow the crop for hay; feed off the aftermath with sheep; and in winter give it a top-dressing of dung. This will produce a crop the second spring, which should be cut for hay. As soon as this crop is carried off plough up the land, and in the beginning of September sow three bushels of rye per acre, either to feed off with sheep in the spring or to stand for harvest. If you feed it off, sow winter vetches in August or September, and make them into hay the following summer. Then get the land into as fine tilth as possible, and sow it with sainfoin, which, with a little manure once in two or three years, will remain and produce good crops for twenty years together.

iii. *Light poor land* seldom produces good crops of any thing, till well manured. After it is well ploughed, sow three bushels of buck wheat per acre, in April or May. When in bloom, let the cattle in a few days eat off the best, and tread the other down; this done, plough in what remains immediately. This will soon ferment and rot; then lay it fine, and sow three bushels of rye per acre. If this can be got off early enough, sow turnips, if not, winter vetches to cut for hay. Then get it in good tilth and sow turnip-rooted cabbages, in rows three feet apart. This plant seldom fails, if it has sufficient room, and the intervals are well horse-hoed; and it is the best spring feed for sheep when turnips are over. The horse-hoeing will clean and prepare the land for sainfoin, for the sowing of which April is the best season. The usual way is to sow it broad-cast, four bushels to an acre; but experienced husbandmen prefer sowing it in drills two feet asunder; for then it may be horse-hoed, and half the seed will be sufficient. The horse-hoeing will also earth up the plants, and render them more luxuriant and lasting. If you sow it broad-cast, give it a top-dressing in December or January of rotten dung or ashes, or rather of both mixed up in compost. From

various trials, it is found that taking only one crop in a year, and feeding the after-growth, is better than to mow it twice. Cut it as soon as it is in full bloom, if the weather will permit. The hay will be the sweeter, and the strength of the plants less impaired, than if it stands till the seed is formed.

iv. *Light rich land*, being the most easy to cultivate to advantage, and capable of bearing most kinds of grain, pulse, and herbage, little need be said upon it. Such lands are the best adapted to the drill husbandry, especially where machines are used, which require shallow furrows to be made for the seed. This, if not prone to couch-grass, is the best of all soils for lucerne; which, if sown in two feet drills, and kept clean, will yield an astonishing quantity of the most excellent herbage. But lucerne will never be cultivated to advantage where couch-grass and weeds abound; nor in the broad-cast method, even where they do not; because horse-hoeing is essential to the vigorous growth of this plant.

v. *Coarse rough land*.—Plough deep in autumn; when it has lain two weeks, cross plough it, and let it lie rough through the winter. In March give it another good ploughing; drag, rake, and harrow it well to get out the rubbish, and sow four bushels of black oats per acre if the soil be wet, and white oats if dry. When about four inches high, roll them well after a shower; this will break the clods; and the fine mould, falling among the roots of the plants, will promote their growth greatly. Some sow clover and rye grass among the oats, but this is bad husbandry. If designed for clover, sow it singly, and let a coat of dung be laid on it in December. The snow and rain will then dilute its salts and oil, and carry them down among the roots of the plants. This is better than mixing the crops on such land; for the oats will exhaust the soil so much that the clover will be impoverished. The following summer you will have a good crop of clover, which cut once, and feed the after-growth. In the winter plough it in, and let it lie till February; then plough and harrow it well; and in March, if the soil be moist, plant beans in drills of three feet, to admit the horse-hoe freely. When you horse-hoe them a second time, sow a row of turnips in each interval, and they will succeed well. But, if the land be strong enough for sowing wheat as soon as the beans are off, the turnips may be omitted.

4. *Of ploughing*.—No operation of agriculture is of more importance than ploughing; and, as the Essex Report on Agriculture here observes, 'there is scarcely a circumstance in agriculture more surprising, after so general attention has been paid to it, than the extreme uncertainty in which the true structure of the plough yet remains. That variations for different soils and circumstances must and ought to occur is admitted; but one plough for one specific object might have been produced, its superiority to others ascertained, and the principles in its construction, on which such merit depended, fully developed, and laid down in accurate drawings; yet this has not been done: the only approximation to it is, it is contended,

in a paper by the late Mr. Arbutnot, which the writer published nearly forty years ago in his 'Eastern Tour.' Farming mechanics, it is supposed, look to the Board of Agriculture for supplying this great deficiency, which can be supplied only by a series of experiments, demanding a considerable expense, and more attention. But more of the construction of particular ploughs hereafter. We only need add here that *wheels* added to ploughs have, in the estimation of many good farmers, been only an apology for want of skill in the ploughman. Yet they often afford much assistance, by enabling him to execute the work with greater regularity in the depth, and more evenness in the surface. From the nature of the machinery with which they are loaded, however, they are evidently more expensive in their construction, more liable to be put out of order, and from the friction that is thus produced require more strength in the teams that are employed in drawing them. Besides, they have the disadvantage of being more apt to be put out of order in their course, by the occurrence of stones, clods, and other surface inequalities, than those of the common kind. A further inconvenience attending these ploughs is noticed by lord Somerville in the Communications to the Board of Agriculture, which is, that with wheel-ploughs workmen are apt to set the points of their shares too low, so as by their inclined direction to occasion a heavy pressure on the wheel, which must proceed horizontally. He conceives the effect of this struggle to be an increased weight of draught infinitely beyond what could be imagined, on which account he thinks that the wheel is to be considered as of no consequence in setting a plough for work; but that passing lightly over the surface it will be of material use in breaking old lays, or lands where flints, rocks, or the roots of trees are present, and in correcting the depression of the share from any sudden obstruction, as also in bringing it quickly into work again, when thrown out towards the surface. It is however believed on the whole, by the writer of the Middlesex Report, that in comparing two extensive districts, one of which is managed with wheel-ploughs, and the other with those of the swing kind, taking ever description of ploughmen that are met with in them, the wheel-ploughs will be found to have the advantage in point of neatness of work.

But the great weight of the carriage parts for the wheels, and the time and trouble which they require in adjusting and fixing them, are great objections to the use of this sort of plough in most cases, and particularly for the general purposes of husbandry. Therefore, in the forming of all sorts of ploughs, the less they are encumbered with machinery of the wheel or other kinds, the more useful they will probably be found.

Holding the plough in a proper position, and properly directing the horses or cattle which draw it, are only to be acquired by experience: it scarcely need be added, that the art of drawing a straight furrow with a plough in which the horses are yoked in pairs, consists in keeping each of the horses a small distance

apart, so as to see forward between them; and next to fix the eye on some object or objects over the land, and keep these objects and the coulter or muzzle of the plough in one line. By far the best practical directions for ploughing, as Mr. Loudon thinks, are thus given in the Supplement to the Encyclopædia Britannica, by Mr. Cleghorn.

Three different points require particular attention in ploughing: 1. The breadth of the slice to be cut; 2. its depth; and 3. the degree in which it is to be turned over;—which last circumstance depends both upon the construction of the plough, particularly the mould-board, and the care of the ploughman.

The breadth and depth of the furrow-slice are regulated by judiciously placing the draught on the nozzle or bridle of the plough; setting it so as to go more or less deep, and to take more or less land or breadth of slice, according as may be desired. In general, the plough is so regulated that, if left to itself, and merely kept from falling over, it would cut a little broader and a little deeper than is required. The coulter is also placed with some inclination towards the left or land side, and the point of the sock or share has a slight tendency downwards. The degree to which the furrow-slice turns over is in a great measure determined by the proportion between its breadth and depth, which for general purposes is usually as three is to two; or, when the furrow is nine inches broad, it ought to be six inches in depth. When the slice is cut in this proportion, it will be nearly half turned over, or recline at an angle of forty or forty-five degrees; and a field so ploughed will have its ridges longitudinally ribbed into angular drills or ridgelets. But if the slice is much broader, in proportion to its depth, it will be almost completely overturned, or left nearly flat with its original surface downwards; and each successive slice will be somewhat overlapped by that which was turned over before it. And, finally, when the depth materially exceeds the width, each furrow-slice will fall over on its side, leaving all the original surface bare, and only laid somewhat obliquely to the horizon.

Ploughing with the breadth and depth nearly in the proportion of three to two is best adapted for laying up stubble land after harvest, when it is to remain during winter exposed to the mellowing influence of frost, preparatory to fallow or turnips. The shallow furrow of considerable width, as five inches in depth by eight or nine wide, is understood to answer best for breaking up old leys; because it covers up the grass turf, and does not bury the manured soil. Ploughing with the depth of the furrow considerably exceeding the width is a most unprofitable and uselessly slow operation, which ought seldom or never to be adopted. The most generally useful breadth of a furrow-slice is from eight to ten inches, and the depth, which ought to be seldom less than four inches, cannot often exceed six or eight inches, except in soils uncommonly thick and fertile. When it is necessary to go deeper, as for carrots and some other deep-rooted plants, a trench ploughing may be given by means of a second plough following in the same furrow.

Shallow ploughing ought always to be adopted after turnips are eaten on the ground, that the manure may not be buried too deep; and also in covering lime,—especially if the ground has been pulverised by fallowing, because it naturally tends to sink in the soil. In ploughing down farm-yard dung, it is commonly necessary to go rather deep, that no part of the manure may be left exposed to the atmosphere. In the first ploughing, for fallows or green crops, it is advisable to work as deep as possible, and no great danger is to be apprehended, though a small portion of the subsoil be at that time brought to the surface. The furrow-slices are generally distributed into beds varying in breadth according to circumstances; these are called ridges or lands, and are divided from one another by gutters or open furrows. These last serve as guides to the hand and eye of the sower to the reapers, and also for the application of manures in a regular manner. In soils of a strong or retentive nature, or which have wet close subsoils, these furrows serve likewise as drains for carrying off the surface water, and being cleared out, after the land is sown and harrowed, have the name of water furrows.

Ridges are not only different in breadth, but are raised more or less in the middle, on different soils. On clayey retentive soils, the great point to be attended to is the discharge of superfluous water. But narrow ridges or stitches, of from three to five feet, are not approved of in some of the best cultivated counties. In these a breadth of fifteen or eighteen feet, the land raised by two gatherings of the plough, is most commonly adopted for such soils; such ridges being thought more convenient for manuring, sowing, harrowing, and reaping than narrower ones; and the water is drained off quite as effectually. Ridges on dry porous turnip soils may be formed much broader; and, were it not for their use in directing the laborers, may be, and sometimes are, dispensed with altogether. They are often thirty, or thirty-six feet broad, which in Scotland are called band-win ridges, because reaped by a band of shearers, commonly six, served by one binder. If it be wished to obliterate the intermediate furrows, this may be done by casting up a narrow ridglet or single bout-drill between the broad ridges, which is afterwards levelled by the harrows.

The mode of forming ridges straight and of uniform breadth is as follows:—Let us suppose a field perfectly level that is intended to be laid off into ridges of any determinate breadth. The best ploughman belonging to the farm conducts the operation, with the aid of three or more poles shod with iron, in the following manner:—The first thing is to mark off the head ridges, on which the horses turn in ploughing, which should in general be of an equal breadth from the bounding lines of the field, if these lines are not very crooked or irregular. The next operation, assuming one straight side of the field, or a line that has been made straight, as the proper direction of the ridges, is to measure off from it with one of the poles (all of them of a certain length, or expressing specific measures), half the intended breadth of the ridge, if it is to

be gathered, or one breadth and a half if to be ploughed flat; and there the ploughman sets up a pole as a direction for the plough to enter. On a line with this, and at some distance, he plants a second pole, and then in the same manner a third, fourth, &c., as the irregularity of the surface may render necessary, though three must always be employed, the last of them at the end of the intended ridge, and the whole in one straight line. He then enters the plough at the first pole, keeping the line of poles exactly between his horses, and ploughs down all the poles successively; halting his horses at each, and replacing it at so many feet distant as the ridges are to be broad; so that, when he reaches the end of the ridge, all his poles are again set up in a new line parallel to the first. He returns, however, along his former track, correcting any deviations, and throwing a shallow furrow on the side opposite to his former one. These furrows, when reversed, form the crown of the ridge, and direct the ploughmen who are to follow. The same operations are carried on until the whole field is marked out. This is called *feiring* in Scotland, and striking the furrows in England. It is surprising with what accuracy these lines are drawn by skilful ploughmen. Another method has been adopted for the same purpose, which promises to be useful with less experienced workmen. A stout lath or pole, exactly equal in length to the breadth of the intended ridge, is fixed to the plough at right angles to the line of the draught, one end of which is placed across the handles exactly opposite the coulter, while the other end projects towards the left hand of the ploughman, and is preserved in its place by a rope passing from it to the collar of the near-side horse. At the outer end of the lath a coulter or harrow tine is fixed perpendicularly, which makes a trace or mark on the ground, as the plough moves onwards, exactly parallel to the line of draught. By this device, when the plough is *feiring* the crown of one ridge, the marker traces the line on which the next ridge is to be *feired*.—*General Report of Scotland*, vol. i. p. 354.

The direction and length of ridges are points which must evidently be regulated by the nature of the surface, and the size of the field. Short angular ridges, called *butts*, which are often necessary in a field with irregular boundaries, are always attended with a considerable loss of time, and ought to be avoided as much as possible. In ploughing steep land it is thought advisable to give the ridges an inclination towards the right hand at the top, by which, in going up the acclivity, the furrow falls more readily from the plough, and with less fatigue to the horses. Another advantage of forming ridges in a slanting direction, on such lands, is that the soil is not so apt to be washed down from the higher ground, as if the ridges were laid at right angles. Wherever circumstances will permit, the best direction, however, is due north and south, by which the grain on both sides of the ridge enjoys nearly equal advantages from the influence of the sun.

‘Land thus formed into ridges,’ says Mr. Loudon, is afterwards cultivated without mark-

ing out the ridges anew, until the inter-furrows have been obliterated by a fallow or fallow crop. This is done by one or other of the following modes of ploughing. 1. If the soil be dry, and the land has been ploughed flat, the ridges are split out in such a way that the space which the crown of the old ridge occupied is now allotted to the open furrow between the new ones. This is technically called crown and furrow ploughing. 2. When the soil is naturally rather wet, or, if the ridges have been raised a little by former ploughings, the form of the old ridges, and the situation of the inter-furrows, are preserved by what is called casting, that is, the furrows of each ridge are all laid in one direction, while those of the next adjoining ridges are turned the contrary way; two ridges being always ploughed together. 3. It is commonly necessary to raise the ridges, on soils very tenacious of moisture, by what is called gathering, which is done by the plough going round the ridge, beginning at the crown, and raising all the furrow slices inwards. 4. This last operation, when it is wished to give the land a level surface, as in fallowing, is reversed by turning all the furrow-slices outwards; beginning at the inter-furrows, and leaving an open furrow on the crown of each ridge. In order to bring the land into as level a state as possible, the same mode of ploughing, or cleaning, as it is called, may be repeated as often as necessary. With respect to ploughing relatively to time, in the strongest lands, a pair of good horses ought to plough three-quarters of an acre in nine hours; but upon the same land, after the first ploughing, on friable soils, one acre or an acre and a quarter is a common day's work. Throughout the year, an acre a day may be considered as a full average on soils of a medium consistency. The whole series of furrows on an English statute acre, supposing each to be nine inches broad, would extend to 19,360 yards; and adding twelve yards to every 220, for the ground travelled over in turning, the whole work of one acre may be estimated as extending to 20,416 yards, or eleven miles and nearly five furlongs.

'In ploughing relatively to season, it is well known that clayey or tenacious soils should never be ploughed when wet; and that it is almost equally improper to allow them to become too dry, especially if a crop is to be sown without a second ploughing. The state in which such lands should be ploughed is that which is commonly indicated by the phrase, 'between the wet and the dry,'—while the ground is slightly moist, mellow, and the least cohesive. The season best for ploughing the first time, for fallow or green crops, is immediately after harvest, or after wheat sowing is finished; and, when this land has been gone over, the old tough swards, if there be any, are next turned up. The reasons for ploughing so early are sufficiently obvious; as the frosts of winter render the soil more friable for the spring operations, and assist in destroying the weed roots. In some places, however, the first ploughing for fallow is still delayed till after the spring seed-time.'

The cultivator, grubber, scuffer, scarifier, &c., are used to lessen the number of ploughings in

fallows or light free soils. Their operation differs from that of the plough in not reversing the surface, and therefore they can never, as some suppose, become a substitute for that implement. Still the grubber is recommended by good judges as a valuable implement. Lester of Northampton, who is said first to have invented an implement of this kind, declares himself confident that one man, a boy, and six horses, will move as much land in a day, and as effectually, as six ploughs: meaning land in a fallow state that has been previously ploughed. And this may allow us to introduce the important question

5. *Of Fallowing.*—'The vague ancient opinion of the use of nitre, and of nitrous salts in vegetation,' says Sir Humphrey Davy, 'seems to have been one of the principal speculative reasons for the defence of summer fallows. Nitrous salts are produced during the exposure of soils containing vegetable and animal remains, and in greatest abundance in hot weather; but it is probably by the combination of the azote from these remains with oxygen in the atmosphere that the acid is formed; and at the expense of an element which otherwise would have formed ammonia; the compounds of which are much more efficacious than the nitrous compounds in assisting vegetation. Mr. Loudon observes 'that this reason is, however, more speculative than experimental, and seems influenced by the opinion adopted by the author, that fallows are of little use in husbandry. One obvious advantage of aeration in summer, or a summer fallow,' he says, 'is, that the soil may thus be heated by the sun to a degree which it never could be, if partially covered with the foliage of even the widest drilled crops. For this purpose, if the soil is laid up in large lumps, it is evident it will receive more heat by exposing a greater surface to the atmosphere, and it will retain this heat longer than can be expected, from the circumstance of the lumps reflecting back the rays of heat radiated by each other.' A clayey soil in this way (*Farmer's Magazine*, 1815) may be heated to 120°, which may in some degree alter its absorbent powers as to water, and contribute materially to the destruction of vegetable fibre, insects, and their eggs. By the aeration of lands, in winter, minute mechanical division is obtained by the freezing of the water in the soil; for, as water in the solid state occupies more space than when fluid, the particles of earthy matters and of decomposing stones are thus rent asunder, and crumble down in a fine mould. Rough stony soils will thus receive an accession to their finer soil every winter.

'Agricultural experience,' adds our author, 'has fully proved that fallows are the only means by which stiff clays in moist climates can be effectually cleared of weeds. Supposing therefore that no other advantage whatever was obtained, that no nutritive matter was imbibed from the atmosphere, and the soil was neither chemically nor mechanically benefited by aeration, this benefit alone, the effectual eradication of weeds, is sufficient to justify the use of fallows on such soils. Many of the objections to fal-

lows have arisen in consequence of the parties not previously agreeing as to what a summer fallow is. In England generally, or at least formerly, a fallow was a portion of land left a year without culture or cropping: unless being once or twice ploughed can be denominated the former, and an abundant growth of coarse grasses and weeds can constitute the latter. The *jachères* of the French are the same thing. In Scotland and the best cultivated districts a summer fallow is a portion of land which is begun to be cultivated after the crop is removed in autumn, and is frequently, as need requires, ploughed, harrowed, and otherwise comminuted, and freed from stones, weeds, inequalities, &c., till the autumnal seed-time of the following year: it is thus for twelve months in a state of constant tillage and movement. The result is that the land is thoroughly freed from roots of weeds; from many seeds of weeds, which are thus made to germinate and are then destroyed; and from many eggs of insects which are thus hatched, but, being without plants to nourish them in their larva state, speedily die. The land is also thoroughly pulverised, and the top, bottom, and middle, mixed together; stones are picked out; inequalities unfavorable to surface drainage removed or lessened, and various other useful objects attained. Such a fallow can no more be compared with what usually passes under that name than the plough of Virgil with that of Small.

East Lothian stands, we believe, at the head of the Scottish counties for excellent farming: and here fallowing, introduced at the beginning of the last century, seems to be practised in its greatest perfection. The sixth earl of Haddington, we are told, was the first proprietor, and John Walker, of Beanston, near Dunbar, the first farmer upon this principle. He took the hint from some English travellers, while they spent a night at his house, and with whom he had conversation upon the subject, so much to his satisfaction that he made an experiment upon six acres the following summer, which he carried through in spite of the animadversions of his neighbours, who were divided in their opinions as to the sanity of his mind, or the stability of his circumstances. The result of the experiment gave them a better opinion of both, and the return was so abundant as to induce him to extend his next year's fallow break to twenty acres; soon after which the practice began to spread, and, so early as the year 1724, fallowing upon all the deep strong soils was common throughout the county, and has continued to be so ever since. The practice of the county is thus described in the General Report of Scotland, vol. i. p. 419.

'Invariably, after harvest, the land intended for being summer fallowed in the ensuing year gets an end-long ploughing, which ought to be as deep as the soil will admit, even though a little of the till or subsoil is brought up. This both tends to deepen the cultivated or manured soil, as the fresh accession of hitherto uncultivated earth becomes afterwards incorporated with the former manured soil, and greatly facilitates the separation of the roots of weeds during the

ensuing fallow process, by detaching them completely from any connexion with the fast subsoil. This autumnal ploughing, usually called the winter furrow, promotes the rotting of stubble and weeds; and, if not accomplished towards the end of harvest, must be given in the winter months, or as early in the spring as possible. In giving this first ploughing, the old ridges should be gathered up, if practicable, as in that state they are kept dry during the winter months; but it is not uncommon to split them out or divide them, especially if the land had been previously highly gathered, so that each original ridge of land is divided into two half ridges. Sometimes, when the land is easily laid dry, the furrows of the old ridges are made the crowns of the new ones, or the land is ploughed in the way technically called crown-and-fur. In other instances two ridges are ploughed together, by what is called casting, which has been already described. After the field is ploughed, all the inter-furrows, and those of the headlands, are carefully opened up by the plough, and are afterwards gone over effectually by a laborer with a spade, to remove all obstructions, and to open up the water furrows into the fence ditches, wherever that seems necessary, that all moisture may have a ready exit. In every place where water is expected to lodge, such as ditches or hollow places in the field, cross or oblique furrows are drawn by the plough, and their intersections carefully opened into each other by the spade. Wherever it appears necessary, cross cuts are also made through the head ridges into the ditches with a spade, and every possible attention is exerted, that no water may stagnate in any part of the field.

'As soon as the spring seed-time is over the fallow land is again ploughed end-long. If formerly split, it is now ridged up; if formerly laid up in gathered ridges, it is split or cloven down. It is then cross-ploughed; and, after lying till sufficiently dry to admit the harrows, it is harrowed and rolled repeatedly, and every particle of the vivacious roots of weeds brought up to view, carefully gathered by hand into heaps, and either burnt on the field or carted off to the compost midden. The fallow is then ridged up, which places it in a safe condition in the event of bad weather, and exposes a new surface to the harrows and roller; after which the weeds are again gathered by hand, but a previous harrowing is necessary. It is afterwards ploughed, harrowed, rolled, and gathered as often as may be necessary to reduce it into fine tilth, and completely to eradicate all root weeds. Between these successive operations, repeated crops of seedling weeds are brought into vegetation and destroyed. The larvæ likewise of various insects, together with an infinite variety of the seeds of weeds, are exposed to be devoured by birds, which are then the farmer's best friends, though often proscribed as his bitterest enemies. Some writers on husbandry have condemned the use of the harrow and roller in the fallow process, alleging that frequent ploughing is all that is necessary to destroy root-weeds, by the baking or drying of the clods in the sun and wind; but experience has ascertained that fre-

quently turning over the ground, though absolutely necessary while the fallow process is going on, can never eradicate couch-grass or other root-weeds. In all clay soils, the ground turns up in lumps or clods, which the severest drought will not penetrate so sufficiently as to kill the included roots. When the land is again ploughed, these lumps are simply turned over and no more, and the action of the plough serves in no degree to reduce them, or at least very imperceptibly. It may be added that these lumps likewise enclose innumerable seeds of weeds, which cannot vegetate unless brought under the influence of the sun and air near the surface. The diligent use, therefore, of the harrow and roller, followed by careful hand-picking, is indispensably necessary to the perfection of the fallow process.

‘When employed to reduce a strong obdurate soil, not more than two of the common sort of harrows should be yoked together, because they are apt to ride and tumble upon each other, and thus impede the work. It may also be remarked that on rough soils harrows ought to be driven as fast as the horses can walk; because their effect is in direct proportion to the degree of velocity with which they are driven: and the harrow-man’s attention should be constantly directed to prevent these implements from riding upon each other, and to keep them clear of every impediment, from stones, lumps of earth, clods, and grass roots. In ordinary cases, and in every case where harrowing is meant for covering the seed, and the common implement in use, three harrows are the best yoke, because they fill up the ground more effectually than when a smaller number is employed; some of the improved forms, calculated to cover the breadth of two or more of the old harrows by one frame, are only fit for flat ridges; or for working dry lands in which ridging is not requisite.

6. *Of the usual crops.*—The preceding part of this treatise is all preparatory to the capital object of a farm, that of raising plants for the nourishment of man and other animals. These (see AGRICULTURE, par. 84) are of two kinds; culmiferous and leguminous; differing widely from each other. Wheat, rye, barley, oats, rye-grass, are of the first kind; of the other kind are peas, beans, clover, cabbage, and many others. The propagation of plants is naturally divided into three subdivisions:—1st. Plants cultivated for fruit; 2d. Plants cultivated for roots; 3d. Plants cultivated for leaves.

SECT. I.—PLANTS CULTIVATED FOR FRUIT.

1. WHEAT takes the lead among plants cultivated for fruit. A sandy soil is thought too loose; the only chance for a crop is after red clover, say some writers, the roots of which bind the soil. Rye is a crop much fitter for sandy soil than wheat; and like wheat is generally sown after a summer-fallow. Sow wheat as soon as the ground is ready. When sown too early, however, it is too forward in spring, and apt to be hurt by frost; when sown a month too late, it has not time to root before frost comes on, and frost spews it out of the ground. The greater part of the wheat crop throughout Britain is probably sown upon fallowed land. ‘When

it succeeds turnips consumed on the ground, or clover cut for hay or soiling, it is commonly sown after one ploughing; but upon heavier soils, or after grass of two or more years, the land is ploughed twice or three times.’

Setting of wheat, or dibbling, is a method which is reckoned one of the greatest improvements in husbandry that was made during the last century. It seems to have been first suggested by planting grains in a garden from curiosity, by persons who had no opportunity of extending it to a lucrative purpose. Nor was it attempted on a larger scale, till a farmer near Norwich began it upon less than an acre of land. For two or three years only a few followed his example; and these were generally the butt of their neighbours. They had, however, considerably better corn and larger crops, which, together with the saving of seed, engaged more to follow them. Experiment established the practice, and was the means of introducing it generally among the intelligent farmers of a very large district.

The lands on which this method was found particularly prosperous were either after a clover stubble, or on which trefoil and grass-seed were sown the preceding year. These grounds, after the usual manuring, were once turned over by the plough in an extended flag or turf, at ten inches wide; along which a man, called a dibbler, with two setting-irons somewhat bigger than ram-rods, but considerably bigger at the lower end, and pointed at the extremity, walked backwards along the turf and made the holes about four inches asunder every way, and one deep. Into these holes the droppers (women, boys and girls) dropped two grains, which is quite sufficient. After this a gate, bushed with thorns, was drawn by one horse over the land, and closed the holes. By this mode, three pecks of grain are sufficient for an acre; and, being immediately buried, it is equally removed from vermin or the power of frost. The regularity of its rising gives the best opportunity of keeping it clear from weeds, by weeding or hand-hoeing. Sir Thomas Beevor of Hethel-Hall, in Norfolk, soon found the produce to be two bushels per acre more than from the wheat which is sown; and, having much less small corn intermixed with it, the sample was better, and always fetched a higher price. This method, too, saves to the farmer and to the public many pecks of seed-wheat.

In light lands a very dry time prevents dibbling, as the holes made with the instruments will be filled up again with the mould as fast as the instrument is withdrawn. So, again, in a very wet season, on strong and stiff clays, the seeds in the holes cannot be properly covered by the bushes drawn over them. But these extremes of dry and wet do not often happen, nor do they affect lands of a moderately consistent texture, or both light and heavy soils at the same time, so that the general practice is in fact never greatly impeded by them.

In the Philosophical Transactions for 1768 we meet with an extraordinary experiment for propagating wheat, of which the following is an abstract:—On the 2d of June, 1766, Mr. C. Miller (son of the celebrated gardener of this

name) sowed some grains of the common red wheat; and on the 8th of August, a single plant was taken up and separated into eighteen parts, and each part planted separately. These plants having pushed out several side-shoots, about the middle of September, some of them were taken up and divided, and the rest between that time and the middle of October. This second division produced sixty-seven plants. These plants remained through the winter, and another division of them, made between the middle of March and the 12th of April, produced 500 plants. They were then divided no further, but permitted to remain. The plants were in general stronger than any of the wheat in the fields. Some of them produced upwards of 100 ears from a single root. Many of the ears measured seven inches in length, and contained between sixty and seventy grains. The whole number of ears which, by the process abovementioned, were produced from one grain of wheat, was 21,109, which yielded three pecks and three quarters of clear corn, the weight of which was forty-seven pounds seven ounces; and, from a calculation made by counting the number of grains in an ounce, the whole number of grains was about 576,840. There was only one general division of the plants made in the spring. Had a second been made, Mr. Miller thinks, the number of plants would have amounted to 2000. The ground was a light blackish soil, upon a gravelly bottom; and consequently a bad soil for wheat. One half of the ground was well dunged, the other half had no manure. There was, however, no difference discoverable in the vigor or growth of the plants. It is evident that the expense and labor of setting in the above manner by the hand, will render it impracticable upon a large scale.

A correspondent of the Bath Society, therefore (Robert Bogle, esq.), to extend the practice, proposed the use of the harrow and roller until some better implements be invented. This method occurred to him from attending to the practice usual with farmers, of harrowing their fields after the grain is sprung up. Upon investigating the principles upon which these practices are founded, they said, 'that after very heavy rains, and then excessive dry weather, the surface of their lands was apt to be caked, the tender fibres of the young roots were thereby prevented from pushing, and of course the vegetation was greatly obstructed; in such instances they found very great benefit from harrowing and rolling.' This reasoning he owns to be well founded, but contends that the benefit arising from harrowing and rolling is not derived from pulverising entirely, but from subdividing and enabling the plants to tiller, as it is termed. 'The harrow,' he observes, 'certainly breaks the incrustation, and the roller crumbles the clods; but the harrow removes many of the plants from their original stations; and, if the corn has begun to tiller at the time it is used, the roots will be in many instances subdivided, and then the application of my system of divisibility comes into play. The roller then serves to plant the roots which have been torn up the harrow.' On this the society observe, that the teeth of a harrow are too large

to divide roots so small and tenacious as those of grain; and, whenever such roots stand in the line any tooth makes, they will, if small, be only turned on one side by the earth yielding to their lateral pressure, or, if large, the whole root will be drawn out of the ground. The principal uses, therefore, derived from harrowing and rolling these crops are, opening the soil between the plants, earthing them up, breaking the clods, and closing the earth about their roots. 'I have conversed,' says Mr. Bogle, 'much with many practical farmers, who all admit that my plan has the appearance not only of being practical, but advantageous. I have also seen in the ninth number of Mr. Young's *Annals of Agriculture* the account of an experiment which strongly corroborates my theory. It was made by the Rev. Mr. Pike of Edmonton. From this, and other experiments which have been made under my own eye, I foresee clearly that the system is practicable, and will certainly be productive of great benefit, should it become general. Besides the saving of nine-tenths of seed in the land sown broad-cast, other very important advantages will attend the setting out of wheat from a seed-bed, such as an early crop; the certainty of good crops; rendering a summer fallow unnecessary; saving dung; and having your wheat perfectly free from weeds without either hand or horse-hoeing: 500 plants in April produced almost a bushel of grain. My gardener says, he can set 1000 plants in a day, which is confirmed by the opinion of two other gardeners.'

Excellent wheat according to Brown (*Traacts on Rural Affairs*) may be grown on light soils, with the exception of soft sands. Such soils, however, are not constitutionally disposed to the growth of that grain; nor will they, under any management, bear such a frequent repetition of it as those already mentioned. Summer fallow on them may safely be dispensed with; because a crop of turnips, which admits every branch of the cleaning process to be more perfectly executed than even a naked or bare fallow does, may be profitably substituted. Wheat here comes in with propriety after turnips, though, in general cases, it must be sown in the spring months, unless the turnips are stored; in which case it may be sown in November; or it may be sown after clover, for the fourth crop after the rotation; or in the sixth year, as a way-going crop, after drilled peas and beans, if the rotation is extended to that length. But, take it any way, it is scarcely possible to raise wheat so extensively upon light soils, even where they are of the richest quality, as is practicable upon clays; nor will a crop of equal bulk upon the one return so much produce in grain as may be got from the other. To enlarge upon this point would only serve to prove what few husbandmen will dispute, though, it may be added, that, on thin sands, wheat ought not to be ventured, unless they are either completely clayed or marled, as it is only with the help of these auxiliaries that such a soil can gain stamina capable of producing wheat with any degree of success.

On soils really calculated for wheat, though

in different degrees, summer fallow is the first and leading step to gain a good crop or crops of that grain. The first furrow should be given before winter, or as early as other operations upon the farm will admit; and every attention should be used to go as deep as possible; for it rarely happens that any of the succeeding furrows exceed the first one in that respect. The number of after-ploughings must be regulated by the condition of the ground and the state of the weather; but, in general, it may be observed that ploughing in length and across, alternately, is the way by which the ground will be most completely cut, and the intention of fallowing accomplished. It has been argued that harrowing clay soils, when summer fallowed, is prejudicial to the wheat crop; but, without discussing this point (such a discussion being unnecessary), it may merely be stated that in a dry season it is almost impracticable to reduce real clays, or to work them too small; and that even in a wet one, supposing they are made surface-smooth, they will, when ploughed up again, consolidate into clods or big lumps after forty-eight hours' drought, and become nearly as obdurate as ever. It is only on thin soils, which have a mixture of peat earth, and are incumbent on a bottom impervious to water, that damage is at any time sustained by over harrowing. Such are generally of a weak texture, and may be broken down with facility by the roller and harrow. If caught by much rain, before the pores are in some measure closed, the moisture is greedily absorbed; and, being prevented from going downwards by the hardness of the subsoil, the whole surface becomes a kind of mortar or paste, unless previously well ridged up; which, to a certain extent, prevents the consequences from being dangerous. These evils, however, must be submitted to by the possessors of such soils, if they want to have them sufficiently fallowed and prepared in a proper manner; for, without reducing them, couch-grass, and especially moss, with which they are commonly stored, cannot be eradicated. If they are reduced in the early part of the season, the danger is small; but to break them down in the latter part ought always to be avoided, unless called for by imperious necessity. When wheat is sown after beans it rarely happens, in this northern climate, that more than one ploughing can be successfully bestowed. Before this is given it is advantageous to cross-harrow the land, which levels the drills, and permits the ploughing process to be executed with precision. Almost in every case the ridges should be gathered up, so that the furrows may be well cleared out, and the plants preserved from injury during the inclement winter season. Clover land should be neatly ploughed, and well laid over, so that the roots of the grasses may be buried and destroyed; for it frequently happens that crops of wheat, after clover and rye-grass, are greatly injured by inattention to the ploughing process. In short, sowing wheat after clover may be considered as the most hazardous way in which that grain can be cultivated.

The manures best calculated for wheat, are now generally allowed to be animal matters and lime.

It is certain according to Sir H. Davy, Chaptal, &c., that wheat will not thrive on any soil that does not contain lime. Professor Thaer says it absorbs more nourishment from the soil than any of the corn tribe; and he calculates (hypothetically, as he allows) that for every 100 parts of nutriment in a soil sown with this grain, forty will be carried off by the crop. (Principes Raisonnées, tom. iv. art. Froment). At the same time too much manure on land in good tilth is very apt to cause the crop to lodge; and hence some people think it improper to dung rich clays or loams when fallowed, and choose rather to reserve that restorative till the succeeding season, when they are prepared for a crop of drilled beans. Delaying the manuring process for a year is attended with many advantages; because good land, fully wrought, contains such a principle of action within itself, as often causes the first wheat crop to be lodged before it is filled; under which circumstance, the produce is diminished both in quantity and quality. This delay in manuring is, however, attended with disadvantages; because, when dung is kept back till the end of autumn or beginning of winter, to be laid on the stubbles, the weather is often so wet that it cannot be carted on without subjecting the land to injury from poaching, whilst the labor in laying it on is also increased. On thin clays, or even upon soils of the other description not in high condition, there can be no doubt but that the end of summer, and upon summer fallow, is the most proper time for manuring them, though it will be found that an improvident expenditure of dung, on such occasions, ought always to be steadily avoided. Where manure is abundant, wheat alternating with a green crop, or indeed any corn crop and a green crop may be grown alternately for any length of time. (Farm. Mag. vol. xiii. p. 298).

Wheat is sown as far north as Petersburg and in Sweden, and will endure a great deal of cold during winter, if sown in a dry or well drained soil. Moderately moist weather before the flowering season, and after the grain is set or formed, is favorable; but continued heavy rains after the flowering season produces the smut. The dry frosty winds of February and March, and even April in some districts, are more injurious to the wheats of Britain than any other weather. Hoar frosts, when the plant is in the ear, produce blights; and mildews often result from or follow sultry winds and fogs. Cold, in the blossoming and ripening season in July, even unaccompanied by wind or rain, produces an inferior grain, greatly deficient in gluten; and heat the contrary. The most valuable wheat of Europe, according to Sir H. Davy, is that of Sicily; which he found to contain much more gluten than any other.

The season of sowing wheat on clays, according to the able writer in the Ency. Brit. Supplement, is generally the latter end of autumn; but on early turning soils it is sown after clover or turnips, at almost every period from the beginning of September till the middle of March; but the far greater part is sown in September and October. For summer wheat, in the southern

districts, May is sufficiently early, but in the north the last fortnight of April is thought a more eligible seed-time. In the cultivation of spring-sown winter wheat, it is of importance to use the produce of spring-sown grain as seed, as the crop of such grain ripens about a fortnight earlier than when the produce of the same wheat winter-sown is employed as spring seed. According to Brown, this process is indispensably necessary on every soil; otherwise smut, to a greater or less extent, will, in nine cases out of ten, assuredly follow. Though almost all practical farmers are agreed as to the necessity of pickling, yet they are not so unanimous as to the *modus operandi* of the process, and the article which is best calculated to answer the intended purpose. Stale urine may be considered as a safe and sure pickle; and, where it can be obtained in a sufficient quantity, is commonly resorted to. The mode of using it does not, however, seem to be agreed upon; one party contends that the grain ought to be steeped in the urine, another considers it as sufficient to sprinkle the urine upon it. Some, again, are advocates for a pickle made of salt and water, sufficiently strong to buoy up an egg, in which the grain is to be thoroughly steeped. But whatever difference of opinion there may be as to the kind of pickle that ought to be used, and the mode of using it, all admit the utility of mixing the wetted seed with hot lime, fresh slaked; and this, in one point of view, is absolutely necessary, so that the seed may be equally distributed. It may be remarked that experience justifies the utility of all these modes, provided they are attentively carried into execution. There is some danger from the first; for, if the seed steeped in urine is not immediately sown, it will infallibly lose its vegetative power. The second, viz. sprinkling the urine on the seed, seems to be the safest, if performed by an attentive hand; whilst the last may do equally well, if such a quantity of salt be incorporated with the water as to render it of sufficient strength. It may also be remarked that this last mode is oftener accompanied with smut, owing no doubt to a deficiency of strength in the pickle; whereas a single head with smut is rarely discovered when urine has been used. A mode of preparing wheat for sowing, recently adopted in the south of Scotland, is thus described:—"Take four vessels, two of them smaller than the other two, the former with wire bottoms, and of a size to contain about a bushel of wheat, the latter large enough to hold the smaller within them. Fill one of the large tubs with water, and, putting the wheat in the small one, immerse it in the water and stir and skim off the grains that float above, and renew the water as often as is necessary, till it comes off almost quite clean. Then raise the small vessel in which the wheat is contained, and repeat the process with it in the other large tub, which is to be filled with stale urine; and in the mean time wash more wheat in the water tub. When abundance of water is at hand, this operation is by no means tedious; and the wheat is much more effectually cleansed from all impurities, and freed more completely from weak and unhealthy grains and

seeds of weeds, than can be done by the winnowing machine. When thoroughly washed and skimmed, let it drain a little; then empty it on a clear floor or in the cart that is to take it to the field, and sift quick-lime upon it, turning it over and mixing it with a shovel, till it be sufficiently dry for sowing." (Supplement, Ency. Brit. art. Agriculture).

The modes of sowing wheat are either broadcast, drilling, ribbing, or dibbling. The first mode is the most general, and the seed is for the most part covered by harrowing; but no more harrowing, Brown observes, should be given to fields that have been fallowed, than what is necessary to cover the seed, and level the surface. Ground which is to lie in a broken down state through the winter suffers severely when an excessive harrowing is given. It is a general practice in most of the southern counties, and even on opposite soils, when wheat is sown broadcast, to plough it in with a shallow furrow. This is done even after beans and on clover leys.

Drilling is also practised, and is becoming more general on lands infested with annual weeds. A machine which sows at three different intervals, according to the judgment of the farmer, of twelve, ten and a half, or nine inches, is much approved of in the northern districts. It deposits six, seven, or eight rows at once, according as it is adjusted to one or other of these intervals, and the work is done with ease and accuracy when the ridges are previously laid out of such a breadth, twelve and a half feet, as to be sown by one bout: the machine going along one side of such a ridge, and returning on the other, and its direction being guided by one of its wheels, which thus always runs in the open furrow between the ridges. If the ten and a half inch interval be adopted, and it is the most common one in that country, the machine sows seven rows at once, or fourteen rows on a ridge of twelve feet and a half. But the space between the rows varies in some parts still more than this machine admits of; it ought not, however, to be so narrow as to prevent hand hoeing, even after the crop has made considerable progress in growth; and it cannot advantageously be so wide as to admit the use of any effective horse-hoe.

Ribbing is a mode of sowing in some places, by which a drill machine is dispensed with. The seed is scattered with the hand in the usual broadcast manner, but, as it necessarily falls for the most part in the furrows between the ribs, the crop rises in straight parallel rows, as if it had been sown by a drill machine: after sowing the ribs are levelled by harrowing across. This plan has nearly all the advantages of drilling in so far as regards exposure to the rays of the sun, and the circulation of air among the plants; but, as some plants must always rise between the rows, it is not quite so proper when horse-hoeing is required.

Of dibbling Mr. Loudon says, notwithstanding the advantages of saving seed, as well as some others which are generally reckoned undeniable, it is asserted by some very judicious farmers that dibbling of wheat on the whole is not really a profitable practice. It is parti-

cularly said to be productive of weeds undoubtedly very thick: which indeed may probably be the case, as the weeds are thus allowed a greater space to vegetate in. Marshal is of opinion that the dibbling of wheat appears to be peculiarly adapted to deep rich soils, on which three or four pecks dibbled early may spread sufficiently for a full crop; whereas light, weak, shallow soils, which have lain two or three years, and have become grassy, require an additional quantity of seed, and consequently an addition of labor, otherwise the plants are not able to reach each other, and the grasses of course find their way up between them, by which means the crop is injured and the soil rendered foul. If a single grain of good size and sound could be dropt in each hole, and no more, there might be an advantage in dibbling where it could be accomplished at a moderate rate; but where two or three grains are put in each hole, and often six or eight, the source of profit is diminished or destroyed by twofold means; first, by using too much seed; and, secondly, because three or four grains springing out of one hole will not make such a strong plant or stool as one sound grain. The only way in which we can conceive dibbling likely to answer is by the use of a machine such as that invented by Plunkett, but which never came into use. To attempt dibbling either wheat or beans by hand, on a large scale, we consider as quite unsuitable for the present improved state of agriculture.

When wheat is sown broad-cast, the subsequent culture is confined to harrowing, rolling, and hand-hoeing: and, as grass seeds are frequently sown in spring on winter-sown wheat, the harrows and roller are employed to loosen the soil, and cover the seeds, operations to a certain extent found beneficial to the wheat crop itself, and sometimes performed when grass seeds are not to be sown. One or two courses of harrowing penetrate the crust which is formed on tenacious soils, and operate like hand-hoeing in raising a fresh mould to the stems of the young plants. Rolling in spring ought never to be omitted on dry porous soils.

When drilling, ribbing, or dibbling has been adopted, the intervals are hoed or stirred either by hand hoes, common or pronged, by horse hoes, or drill harrows. In general the drill used at sowing will be the best to use for hoeing or stirring. Or, if a single drill should have been used, the expanding horse hoe, or Blakie's invented horse-hoe, may be successfully adopted. The operation of hoeing or stirring should generally be performed in March. Weeding the rows should not be delayed later than the end of May.

Where wheats rise uneven, or too thin in some places and too thick in others, the practice of transplanting has been practised in Essex and Norfolk, at the end of March. Blanks are sometimes filled up by sowing summer wheat, dibbling beans, &c., but these are obviously bad modes; a better is either to stir the soil well, and encourage the tillering of the plants, or to stir the soil and then transplant.

Substances both solid and fluid have been made use of for top dressing wheat where the and or growth is poor; the first consist chiefly

of birds' dung brought into a powdery state, bone-dust, soot, peat-ashes, and saline matters; the latter are principally the drainings of dung-hills, &c. The former should be thinly and evenly sown over the crop, as early in the spring as horses can be admitted on the land; and a roller may then be passed over the crop. Where the latter substances are made use of, care should always be taken that the plants be not injured by having too large a quantity applied. The season for performing this business is the beginning of February. When wheat appears too forward, it is sometimes eat down in April, with sheep or even with horses, but this requires great judgment.

The best farmers agree that wheat ought to be cut before it become dead ripe. In ascertaining the proper state, Brown observes, it is necessary to discriminate betwixt the ripeness of the straw, and the ripeness of the grain; for in some seasons the straw dries upwards; under which circumstance, a field to the eye may appear to be completely fit for the sickle, when in reality the grain is imperfectly consolidated; and perhaps not much removed from a milky state. Though it is obvious that, under such circumstances, no further benefit can be conveyed from the root, and that nourishment is withheld the moment that the roots die; yet it does not follow that grain so circumstanced should be immediately cut; because, after that operation is performed, it is in a great measure necessarily deprived of every benefit from the sun and air, both of which have greater influence in bringing it to maturity, so long as it remains on foot, than when cut down, whether laid on the ground, or bound up in sheaves. The state of the weather at the time also deserves notice; for, in moist or even variable weather, every kind of grain, when cut prematurely, is more exposed to damage than when completely ripened. All these things will be studied by the skilful husbandman, who will also take into consideration the dangers which may follow, were he to permit his wheat crop to remain uncut till completely ripened. The danger from wind will not be lost sight of, especially if the season of the equinox approaches; even the quantity dropped in the field, and in the stack-yard, when wheat is over ripe, is an object of consideration. The mode of reaping is almost universally by the sickle. In a few days of good weather the crop is ready for the barn or stack-yard, where it is built either in oblong or circular stacks, sometimes on frames supported with pillars to prevent the access of vermin, and to secure the bottom from dampness; as soon afterwards as possible the stacks should be neatly thatched. When the harvest weather is so wet as to render it difficult to prevent the stacks from heating, it has been the practice to make funnels through them, a large central one, and small lateral ones to communicate. Corn keeps better in a well-built stack than in any barn.

Wheat is now the cleanest threshed grain; because the length of the straw allows it to be properly beaten out before it passes the machine, which sometimes is not the case with short oats and barley. If horses are used as the impelling

power, thin feeding is necessary, otherwise the animals may be injured; but where wind or water is employed, the business of threshing is executed speedily, completely, and economically.—*Brown*. In performing the operation one man feeds the grain in the straw into the machine, and is assisted by two half-grown lads, or young women, one of whom pitches or carries the sheaves from the boy close to the threshing stage, while the other opens the bands of every sheaf, and lays the sheaves successively on a small table close by the feeder, who spreads them evenly on the feeding stage, that they may be drawn in successively by the fluted rollers, to undergo the operation of threshing. In the opposite end of the barn or straw-house, into which the rakes or shakers deliver the clean threshed straw, one man forks up the straw from the floor to the straw-mow, and two lads or young women build it, and tread it down. In a threshing machine, worked by water or wind, this is the whole expense of hand-labor in the threshing part of the operation, and, as a powerful machine can easily thresh from 200 to 300 bushels of grain in a working day of nine hours, the expense is exceedingly small indeed. Assuming 250 bushels as an average of the work of these people for one day, and their wages to be nine shillings, the expense does not amount to one halfpenny for each bushel of grain. Even reducing the quantity of grain threshed to 150 bushels, the easy work of a good machine of inferior size and power, the expense does not exceed three farthings the bushel. But the whole of this must not be charged against the threshing only, the grain being half dressed at the same time, by passing through one winnowing-machine, which is always attached to a complete threshing-mill; and where a second can be conveniently connected with it, as is commonly the case if the mill be of considerable power, the corn comes down nearly ready for market. So that the threshing, dressing, and building of the straw, with the use of a powerful water-mill, will scarcely cost more than dressing alone when the flail is employed; after every reasonable allowance for the interest of money, and the tear and wear of the machine. When grain is threshed with a machine worked by horses, the expenses are considerably enhanced. One capable of effecting the larger quantity of work, already calculated on, will require eight good horses, and a man to drive them, who may perhaps require the aid of a boy. The value of the work of eight horses for a day cannot be less than forty shillings, and the wages of the driver may be called two shillings and sixpence. Hence the total expense of threshing 250 bushels will amount to £2 2s. 6d.: or about two-pence per bushel, when the wages of the attendants are added; still leaving a considerable difference in favor of threshing by the machine, in preference to the flail. Were it even ascertained that the expense of threshing by horses and by the flail is nearly the same, horse-mills are to be recommended on other accounts; such as better threshing, expedition, little risk of pilfering, &c.

Professor Thaer says, that in general wheat gives double the weight of straw than it does of grain; on elevated ground something less; and

on low grounds something more. An acre, therefore, which produces four quarters of wheat, weighing sixty-one pounds per bushel, ought to produce about 177½ cwt. of straw; two loads, or twenty-two hundred weight and a half, however, is only reckoned a tolerable crop in this country. The yield of grain in some seasons has been under twenty; while in others it is upwards of thirty bushels the acre, the soil and culture being in every respect the same. The average produce of Britain has been estimated at three, three and a half, and four quarters; and one of the largest crops ever heard of at ten quarters, and the least at one quarter and a half. The proportion which the corn bears to the straw, in Middlesex, is eleven bushels and a half to a load of thirty-six truss of thirty-six pounds each, or eleven hundred weight and a half.

2. RYE is a bread corn of Germany and Russia. In Britain it is now very little grown: being no longer a bread corn, and therefore of less value to the farmer than barley, oats, or pease. The varieties are not above two, winter and spring rye; but there is so little difference between them that spring rye sown along with winter rye can hardly be distinguished from it.

Rye, as we have said, will grow in dry sandy soils; on the whole it may be considered as preferring sands to clays. The preparation of the soil should be similar to that for wheat. According to professor Thaer, rye abstracts thirty parts in 100 of the nutriment contained on the soil in which it is grown. The after culture, harvesting, and threshing, are also the same as on wheat.

3. OATS.—As winter ploughing enters into the culture of oats, we must remind the reader of the effect of frost upon tilled land. Providence has neglected no region intended for the habitation of men. If in warm climates the soil be meliorated by the sun, it is no less meliorated by frost in cold climates. Frost acts upon water, by expanding it into a larger space; but has no effect upon dry earth, or sand. Upon wet earth, however, it acts most vigorously; and expands the moisture; which, requiring more space, puts every particle of earth out of its place, and separates them from each other. In that view, frost may be considered as a plough superior to any that can be made by the hand of man: its action reaches the minutest particles; and, by dividing and separating them, it renders the soil loose and friable. This operation is most remarkable in tilled land, which gives free access to frost.

The common method is to sow oats on new-ploughed land in March, as soon as the ground is tolerably dry. If it continues wet all March, it is too late to venture them after. It is much better to summer-fallow, and to sow wheat in the autumn. But the preferable method, especially in clay soil, is to turn over the field after harvest, and to lay it open to the influences of frost and air, which lessen the tenacity of clay, and reduce it to a free mould. The surface soil by this means is finely mellowed for reception of the seed; and it would be a pity to bury it by a second ploughing before sowing. In general, the bulk of clay-soils are rich; and skilful ploughing, without dung, will probably give

a better crop than unskilful ploughing with dung.

We must add a word respecting clays which are artificial, whether left by the sea, or swept down from higher grounds by rain. The method commonly used of dressing, which has been called carse-clay for oats, is, not to stir it till the ground be dry in spring, which seldom happens before the 1st of March, and the seed is sown as soon after as the ground is sufficiently dry for its reception. Frost has a stronger effect on such clays than on natural clay. And, if the field be laid open before winter, it is rendered so loose by frost as to be soon drenched in water. The particles at the same time are so small as that the first drought in spring makes the surface cake or crust. The difficulty of reducing this crust into mould for covering the oat-seed, has led farmers to delay ploughing till March. But we are taught by experience that this soil, ploughed before winter, is sooner dry than when the ploughing is delayed till spring; and, as early sowing is a great advantage, the objection of the superficial crusting is easily removed by the first harrow above described, which will produce abundance of mould for covering the seed. The ploughing before winter not only procures early sowing, but has another advantage; the surface soil that had been mellowed during winter by the sun, frost, and wind, is kept above.

The dressing a loamy soil for oats differs little from dressing a clay soil, except that, being less hurt by rain, it requires not high ridges, and therefore ought to be ploughed crown and furrow alternately. Where there are both clay and loam in a farm, it is obvious from what is said above, that the ploughing of the clay after harvest ought first to be despatched. If both cannot be overtaken that season, the loam may be delayed till the spring with less hurt.—Next of a gravelly soil; which is the reverse of clay, as it never suffers but from want of moisture. Such a soil ought to have no ridges; but be ploughed circularly from the centre to the circumference, or from the circumference to the centre. It ought to be tilled after harvest: and the first dry weather in spring ought to be laid hold of to sow, harrow, and roll; which will preserve it in sap.

The culture of oats is simple. That grain is probably a native of Britain: it grows on the worst soil with very little preparation. Before turnips were introduced, it was always the first crop upon land broken up from the state of nature. Upon such land, it may be a good method to build upon the crown of every ridge, in the form of a wall, all the surface earth, one sod above another, as in a fold for sheep. After standing in this form all summer and winter, let the walls be thrown down, and the ground prepared for oats. This will secure one or two good crops; after which the land may be dunged for a crop of barley and grass seeds. This method may answer in a farm where manure is scarce.

In England oats are generally cut down with the scythe, and carried loose to the barn or stack; but in the northern districts, and where threshing machines are used, they are tied into sheaves if mown, but, for the most part, reaped with the

sickle, in order in both cases to facilitate the process of threshing. They are ready for the scythe or sickle when the grain becomes hard, and the straw yellowish. Like wheat they should generally be cut before they are dead ripe, to prevent the shedding of the grain, and to increase the value of the straw as fodder. They rarely get much damage when under the harvest process, except from high winds, or from shedding, when opened out after being thoroughly wetted. The early varieties are much more liable to these losses than the late ones; because the grain parts more easily from the straw, an evil to which the best of grain is at all times subject. Early oats, however, may be cut a little quick, which, to a certain extent, lessens the danger to which they are exposed from high winds; and, if the sheaves be made small, the danger from shedding after rains is considerably lessened, because they are thus sooner ready for the stack. Under every management, however, a greater quantity of early oats will be lost during the harvest process than of the late ones, because the latter adhere firmly to the straw, and consequently do not drop so easily as the former.—Brown.

In Sweden, in most seasons, the oat crop is dried on frames or poles, and in Russia, not only oats, but barley and rye are kiln-dried in the straw. The produce of oats is generally considered greater and of better quality in the northern than in the southern counties; and the reasons are obviously that, in the former, more attention is paid to their culture, and the climate is more favorable for the maturation of the grain. Ten quarters an acre is reckoned a good crop in the north, but the produce is often twelve and thirteen quarters, and the straw from two to three and a half loads per acre. In meal the produce is eight lbs. for fourteen lbs. of corn. Sir H. Davy found 100 parts of oats afforded fifty-nine parts of starch, six of gluten, and two of saccharine.

4. BARLEY is a culmiferous plant that requires a mellow soil. In England it ranks next in value as a crop to wheat. Extraordinary care is requisite where it is to be sown in clay. The land ought to be stirred immediately after the crop is removed, which lays it open to be mellowed with the frost and air. In that view the sort of ploughing has been introduced termed ribbing, by which the greatest quantity of surface possible is exposed to the air. The obvious objection to this method is, that half of the ridge is left unmoved: and, to obviate it, the following method is offered, which moves the whole soil, and at the same time exposes the same quantity of surface to the frost and air. As soon as the former crop is off the field, let the ridges be gathered with as deep a furrow as the soil will admit, beginning at the crown and ending at the furrows. This ploughing loosens the whole soil, giving free access to the air and frost. Soon after, begin a second ploughing: let the field be divided by parallel lines cross the ridges, with intervals of thirty feet or so. Plough once round an interval, beginning at the edges, and turning the earth toward the middle of the interval; which covers a foot or so of the ground

formerly ploughed. Within that foot plough another round similar to the former; and after that other rounds, till the whole interval be finished, ending at the middle. Instead of beginning at the edges, and ploughing toward the middle, begin at the middle and plough toward the edges. Plough the other intervals in the same manner. As the furrows of the ridges will thus be pretty much filled up, let them be cleared and water-furrowed without delay. By this method, the field will be left ridged up for winter. In this form the field is kept perfectly dry; for, beside the capital furrows that separate the ridges, every ridge has a number of cross furrows that carry the rain instantly to the capital furrows. In hanging grounds retentive of moisture, the parallel lines ought not to be perpendicular to the furrows of the ridges, but to be directed a little downward, to carry rain water the more hastily to these furrows. If the ground be clean, it may lie in that state winter and spring, till the time of seed-furrowing. If weeds rise, they must be destroyed by ploughing, or braking, or both; for there cannot be worse husbandry than to put seed into dirty ground.

This method resembles common ribbing in appearance, but is very different in reality. As the common ribbing is not preceded by a gathering furrow, the half of the field is left untilled, compact as when the former crop was removed, impervious in a great measure to air or frost. The common ribbing at the same time lodges the rain-water on every ridge, preventing it from descending to the furrows, which is hurtful in all soils, and destructive in a clay soil. The stitching here described, or ribbing, prevents these noxious effects. By the two ploughings the whole soil is opened, admitting freely air and frost; and the multitude of furrows lays the surface perfectly dry. When it is proper to sow the seed, all is laid flat with the brake, and the seed-furrow which succeeds is so shallow as to bury little or none of the surface earth: whereas the stirring for barley, being done with the deepest furrow, buries all the surface-soil that was mellowed by the frost and air. This method is also less expensive; for after common ribbing, which keeps in the rain water, the ground is commonly so soured as to make the stirring a laborious work.

Barley is less valuable when it does not ripen equally. That which comes up speedily in a dusky soil, gains a great advantage over seed-weeds. Therefore, first take out about one-third of the contents of the sacks of seed barley, to allow for the swelling of the grain. Lay the sacks with the grain to steep in clean water; let it lie covered with it for at least twenty-four hours. When the ground is dry, and no likelihood of rain for ten days, it is better to lie thirty-six hours. Sow the grain wet from steeping, without any powdered quicklime, which would suck up part of its useful moisture. The seed will scatter well, but the sower must put in one-quarter, or one-third more seed in bulk than usual of dry grain, as the grain is swelled in that proportion: harrow it in as quickly as possible after it is sown: and give it the benefit of a fresh furrow. It will rise in a fortnight at farthest.

The following experiment by a correspondent of the Bath Society is considered as interesting:—The last spring, 1783, being remarkably dry, I soaked my seed barley in the black water taken from a reservoir which constantly receives the draining of my dung heap and stables. As the light corn floated on the top, I skimmed it off, and let the rest stand twenty-four hours. On taking it from the water, I mixed the seed grain with a sufficient quantity of sifted wood ashes, to make it spread regularly, and sowed three fields with it. I began sowing the 16th and finished the 23rd of April. The produce was sixty bushels per acre, of good clean barley, without any small or green corn, or weeds at harvest. No person in this county had better grain, I sowed also several other fields with the same seed dry, and without any preparation; but the crop, like those of my neighbours, was very poor; not more than twenty bushels per acre, and much mixed with green corn and weeds. I also sowed some of the seed dry one ridge in each of my former fields, but the produce was very poor in comparison of the other parts of the field.

Where the land is in good order, and free of weeds, April is the month for sowing barley. Every day is proper. The dressing loamy soil and light soil for barley, is the same with that described; only that to plough dry is not so essential as in dressing clay soil. Loam or sand may be stirred a little moist: better, however, delay a week or two, than to stir a loam when moist. Clay must never be ploughed moist, even though the season should escape altogether. But this will seldom be necessary; for not in one year of twenty will it happen, but that clay is dry enough for ploughing some time in May. Frost may correct clay ploughed wet after harvest; but, ploughed wet in the spring, it unites into a hard mass, not to be dissolved but by very hard labor.

On the cultivation of this grain we have the following observations by a Norfolk farmer: 'The best soil is that which is dry and healthy, rather light than stiff, but yet of sufficient strength to retain moisture. On this kind of land the grain is always the best bodied and colored, and has the thinnest rind. These qualities recommend it most to the maltster. If the land is poor, it should be dry and warm; and when so it will often bear better grain than richer land in a cold and wet situation. In the choice of seed, the best is of a pale lively color and brightish cast, without any deep redness or black tinge at the tail. If the rind be a little shrivelled, it is the better; for that slight shriveling proves it to have a thin skin, and to have sweated in the mow. The necessity of a change of seed by not sowing two years together what grew on the same soil, is not in any part of husbandry more evident than in the culture of this grain, which, if not frequently changed, will grow coarser every year. Liming has been found prejudicial. Sprinkling a little soot with the water in which it is steeped has been of great service, as it secures the seed from insects. In a very dry seed time, barley that has been wetted for malting, and begins to sprout, will come up sooner, and produce a good crop. On lands

tolerably manured,' adds this writer, 'I sowed clover with my barley, which I reaped at harvest; and fed the clover all the following winter, and from spring to July, when I fallowed it till the following spring, and then sowed it with barley and clover as before. Repeating this method every year, I had very large crops; but would not recommend this practice on poor light land. We sow on our lightest lands in April, on our moist lands in May; finding that those lands which are the most subject to weeds produce the best crops when sown late. The common method is to sow the barley seed broad-cast at two sowings, the first harrowed in once, the second twice; the usual allowance from three to four bushels per acre. But if farmers could be prevailed on to alter this practice, they would soon find their account in it. Were only half the quantity sown equally, the produce would be greater, and the corn less liable to lodge; for, when corn stands very close, the stalks are drawn up weak, and on that account are less capable of resisting the force of winds, or supporting themselves in heavy rains. From our great success in setting and drilling wheat, some of our farmers tried these methods with barley; but did not find it answer their expectations, except on very rich land. I have myself had eighty stalks on one root of barley, which all produced good and long ears, and the grain was better than any other; but the method is too expensive for general practice. In poor land, sow thin, or your crop will be worth little. Farmers who do not reason on the matter will be of a different opinion; but the fact is indisputable.'

When the barley is sowed, and harrowed in, he advises that the land be rolled after the first shower of rain to break the clods. This will close the earth about the roots, which will be a great advantage to it in dry weather. When the barley has been up three or four weeks, roll it again with a heavy roller, which will prevent the sun and air from penetrating the ground to the injury of the roots. This rolling, before its branches out, will also cause it to tiller into a greater number of stalks; so that if the plants be thin, the ground will be thereby filled, and the stalks strengthened. If the blade grows too rank, as it sometimes will in a warm wet spring, mowing is a much better method than feeding it down with sheep; because the scythe takes off only the rank tops, but the sheep, being fond of the sweet end of the stalk next the root, will often bite so close as to injure its future growth.

The preparation of the soil for barley is often by a turnip fallow; sometimes it is taken after pease and beans, but rarely by good farmers, either after wheat or oats. When sown after turnips, it is taken with one furrow, which is given as fast as the turnips are consumed, the ground thus receiving much benefit from spring frosts. But often two or more furrows are necessary for the fields last consumed; because, when a spring drought sets in, the surface, from being poached by the removal or consumption of the crop, gets so hardened as to render a greater quantity of ploughing, harrowing, and rolling necessary, than would otherwise be called for. When sown after beans and pease, one

winter and one spring ploughing are usually bestowed; but, when after wheat or oats, three ploughings are necessary, so that the ground may be put in proper condition. These operations are very ticklish in a wet and backward season, and rarely in that case is the grower paid for the expense of his labor. Where land is in such a situation as to require three ploughings before it can be seeded with barley, it is better to summer fallow it at once, than to run the risks which seldom fail to accompany a quantity of spring labor. If the weather be dry, moisture is lost during the different processes, and an imperfect germination necessarily follows: if it be wet, the benefit of ploughing is lost, and all the evils of a wet seed-time are sustained by the future crop. Browne.—After turnips, eaten on the ground by sheep, the land, being consolidated by their treading, sometimes receives two ploughings; but, if only one, it should be well harrowed and rolled; and it is often finished by harrowing after the roller, especially if grass-seeds be sown, which are covered by this last harrowing. Barley is sometimes sown on the first ploughing, and covered by a second shallow ploughing. As it is found of great importance, with a view to speedy and equal vegetation, that the ground should be fresh and moist, barley is generally sown upon what is termed hot-fur, that is, as soon as possible after it is turned up by the plough. Manure can seldom be applied with advantage. The climate most favorable to barley is a warm and dry one. There are instances of a crop being sown and ripened without having enjoyed a single shower of rain: but gentle showers from the time it is sown till it begins to shoot into the ear are favorable; while heavy rains at any period, and especially immediately after sowing, are highly injurious.

No grain requires such careful *harvesting*. It should be cut at a time when the grain is soft, and the straw retains a great proportion of its natural juices. It is generally cut down in England with the cradle scythe, and either tied up or carted home loose after lying in the swarth some days to dry. It is not apt to shed; but in wet weather it will be apt to spout or grow musty; and therefore every fair day after rain it should be shook up and turned; but be careful never to house it till thoroughly dry, lest it mow-burn, which will make it malt worse than if it had spired in the field. Lisle says, that poor thin barley should be cut a little sooner than if the same plants were strong and vigorous; as the straw, when the plants are full ripe, in such cases will not stand against the scythe. In this situation, barley in particular should lie in swarth till it is thoroughly dry. Some of his barley, which lay out in swarth five or six days in very fine weather, though both blighted and edge-grown, grew plump, and acquired very nearly as good a color as the best. He reckons short scythes the best for mowing lodged or crumpled corn, because they miss the fewest plants; and observes that a bow upon the scythe, which carries away the swarth before it, is preferable to a cradle, the fingers of which would be pulled to pieces by the entangled corn, in drawing back the scythe. In Scotland and Ireland it is generally reaped with the sickle. Make an

opening in the stack from top to bottom, by placing a large bundle of straw in the centre of the stack, when it commences, and in proportion as it rises, the straw is drawn upwards, leaving a hollow behind; which, if one or two openings are left in the side of the stack near the bottom, insures a complete circulation of air. Threshing machines for barley are furnished with what is called a hummeling machine, and, where this is wanting, it is customary to put the grain, accompanied with a portion of threshed straw, a second time through the machine. Where barley has been mown, the whole of the straw requires to be twice threshed, independently of the necessity of getting rid of the ears. The produce of barley, taking the average of England and the south of Scotland, Donaldson considers, might be rated at thirty-two bushels; but when Wales and the north of Scotland are included, where, owing to the imperfect modes of culture still practised, the crops are very indifferent, the general average will not probably exceed twenty-eight bushels the acre. Middleton states it as varying in England from fifteen to seventy-five bushels per acre. The average produce of the county of Middlesex is about four quarters of corn and two loads of straw per acre.

5. **BUCK WHEAT** delights in a mellow sandy soil; but succeeds well in any dry loose healthy land, and moderately so in a free loamy stone brash. A stiff clay is its aversion, and it is entirely labor lost to sow it in wet poachy ground. The proper season for sowing is from the last week of May or the beginning of June. It has been sown, however, so early as the beginning of April, and so late as the 22nd of July, by way of experiment; but the latter was rather too great an extreme, and the former was in danger from frost. In an experiment, upon a small piece of ground, the grain of two different crops was brought to maturity in summer 1787. After spring feedings, a crop of turnip-rooted cabbage, or vetches, there will be sufficient time to sow the land with buck-wheat. In hot dry summers, a crop of vetches might even be mown for hay early enough to introduce a crop of this grain after it. It will grow on the poorest soil, and produce a crop in the course of three or four months. It was cultivated so early as Gerard's time, 1597, to be ploughed in as manure; but at present, from its inferior value as a grain, and its yielding very little haulm for fodder or manure, it is seldom grown but by gentlemen in plantations, to encourage game. Arthur Young recommends farmers in general to try this crop. It has numerous excellencies, he says, perhaps as many to good farmers as any other grain or pulse in use. It is of an enriching nature, having the quality of preparing for wheat, or any other crop. One bushel sows an acre of land well, which is but a fourth of the expense of seed-barley. It should not be sown till the end of May. This is important; for it gives time in the spring to kill all the seed-weeds in the ground, and brings no disagreeable necessity from bad weather in March or April, to sow barley, &c., so late as to hazard the crop. It is as valuable as barley, and is the best of all crops for sowing grass seeds with, giving them the

same shelter as barley or oats without robbing.

Buck-wheat is mown and harvested in the manner of barley. After it is mown, it must lie several days, till the stalks be withered, before it be housed. It is in no danger of the seeds falling, nor does it suffer much by wet. From its great succulency it is liable to heat, on which account it is better to put it in small stacks of five or six loads each, than in either a large one or a barn. The produce may be stated upon the average at between three and four quarters per acre; it would be considerably more did all the grains ripen together, but that never appears to be the case. Its use in this country is almost entirely for feeding poultry, pigeons, and swine. It may also be given to horses, which are said to thrive well on it; but the author of the *New Farmer's Calendar*, says, he thinks he has seen it produce a stupefying effect. We should add that it has been used in the distillery in England, and is a good deal used in that way, and as horse corn on the continent. Young says, a bushel goes farther than two bushels of oats, and, mixed with at least four times as much bran, will be full feed for any horse a week. Four bushels of the meal, put up at four hundred weight will fatten a hog of sixteen or twenty stone in three weeks, giving him afterwards three bushels of Indian corn or hog-pease, broken in a mill, with plenty of water. Eight bushels of buck-wheat meal will go as far as twelve bushels of barley meal. The meal is made into thin cakes called crumpits in Italy, and even in some parts of England; and it is supposed to be nutritious, and not apt to turn acid upon the stomach.

6. **BEANS.**—The most proper soil for beans is a deep and moist clay. There has been introduced into Scotland a method of sowing beans with a drill-plough, and horse-hoeing the intervals; which, beside affording a good crop, is a dressing to the ground. In the common way, as this grain is early sown, the ground intended for it should be ploughed before winter, to give access to the frost and air—beneficial in all soils, and necessary in a clay soil. Take the first opportunity after January, when the ground is dry, to loosen the soil with the harrow, till a mould be brought upon it. Then sow the seed and cover it equally. Beans ought to be laid deep in the ground, not less than six inches. In clay soil, the common harrows are altogether insufficient. The soil which has rested long after ploughing is rendered compact and solid; the common harrows skim the surface: the seed is not covered; and the first hearty shower of rain lays it above ground. If the ground ploughed before winter happen, by a superfluity of moisture, to cake, the first harrow going along the ridges, and crossing them, will loosen the surface, and give access to the air for drying. As soon as the ground is dry, sow without delay. If rain happen in the interim, wait till a dry day or two come. Carse clay, ploughed before winter, seldom fails to cake. Upon that account, a second ploughing is necessary before sowing; which ought to be performed with an ebb furrow, to keep the frost mould as near the surface as possible. To cover the seed with the plough is expressed by the phrase to sow unde

furrow. The clods raised in this ploughing are a sort of shelter to the young plants in the chilly spring months. The above method will answer for loam. As for a sandy or gravelly soil, it is altogether improper for beans.

Though we cannot approve the horse-hoeing of beans, with the intervals that are commonly allotted for turnip, yet we would strongly recommend the drilling them at the distance of ten or twelve inches, and keeping the intervals clean of weeds. This may be done by hand-hoeing, at the same time laying fresh soil to the roots of the plants. But as this is expensive, and hands are not always to be got, a narrow plough, drawn by a single horse, might be used, with a mould-board on each side to scatter the earth upon the roots of the plants. This is a cheap and expeditious method; it keeps the ground clean, and nourishes the plants with fresh soil. As beans delight in a moist soil, and have no end of growing in a moist season, they cover the ground totally when sown broad-cast, keep in the dew, and exclude the sun and air: the plants grow to a great height, but carry little seed, and that little not well ripened. Hence the advantage of drilling; which gives free access to the sun and air, dries the ground, and affords plenty of ripe seed.

Brown, a very superior bean grower, gives the following directions:—The furrow ought to be given early in winter, and as deep as possible, that the earth may be sufficiently loosened, and room afforded for the roots of the plant to search for the requisite nourishment. The first furrow is usually given across the field, which is the best method when only one spring furrow is intended; but, as it is now ascertained that two spring furrows are highly advantageous, perhaps the one in winter ought to be given in length, which lays the ground in a better situation for resisting the rains, and renders it sooner dry in spring, than can be the case when ploughed across. On the supposition that three furrows are to be given, one in winter, and two in spring, the following is the most eligible preparation. The land being ploughed in length, as early in winter as is practicable, and the cross gutter and headland furrows sufficiently digged out, take the second furrow across the first as soon as the ground is dry enough in spring to undergo the operation; water-furrow it immediately, and dig again the cross gutter and headland furrows, otherwise the benefit of the second furrow may be lost. This being done, leave the field for some days, till it is sufficiently dry, when a cast of the harrow becomes necessary, so that the surface may be levelled. Then enter with the ploughs, and form the drills. Manure is frequently applied, especially if the bean crop succeed wheat.—*Treatise on Rural Affairs.* According to Brown, the best way is to apply the dung on the stubble before the winter furrow is given, which greatly facilitates the after process. Used in this way, a fore stock must be in hand; but, where the farmer is not so well provided, spring dunging becomes necessary, though evidently of less advantage. At that season it may either be put into the drills before the seed is sown, or spread upon the surface and ploughed down, according to the

nature of the drilling process which is meant to be adopted. Land dunged to beans, if duly hoed, is always in high order for carrying a crop of wheat in succession. Perhaps better wheat, both in respect of quantity and quality, may be cultivated in this way, than in any other mode of sowing.

In one mode of drilling beans, the lands or ridges are divided by the plough into ridgelets, or one bout stitches, at intervals of about twenty-seven inches. If dung is to be applied, the seed ought to be first deposited, as it is found inconvenient to run the drill machine afterwards. The dung may then be drawn out from the carts in small heaps, one row of heaps serving for three or five ridgelets; and it is evenly spread, and equally divided among them, in a way that will be more minutely described when treating of the culture of turnips. The ridgelets are next split out or reversed, either by means of the common plough, or one with two mould-boards, which covers both the seed and the manure in the most perfect manner. When beans are sown by the other method, in the bottom of a common furrow, the dung must be previously spread over the surface of the winter or spring ploughing. Three ploughs then start in succession, one immediately behind another, and a drill harrow either follows the third plough or is attached to it, by which the beans are sown in every third furrow, or at from twenty-four to twenty-seven inches asunder, according to the breadth of the furrow-slice. Another approved way, when dung is applied at seed time, is to spread the dung and to plough it down with a strong furrow; after this shallow furrows are drawn, into which the seed is deposited by the drill-machine. Whichever of these modes of sowing is followed, the whole field must be carefully laid dry by means of channels formed by the plough, and when necessary by the shovel; for neither then nor at any former period should water be allowed to stagnate on the land. The dibbling of beans is considered by Arthur Young as an excellent plan.

7. PEASE are of two kinds, the white and the gray: the cultivation of the latter only belongs to this place. There are two principal species of the gray kind, distinguished by their time of ripening. One ripens soon, and for that reason is termed hot seed; the other, which is slower in ripening, is termed cold seed.

Pease, a leguminous crop, is proper to intervene between two culmiferous crops; less for the profit of a pease crop, than for meliorating the ground. Pease, however, in a dry season, will produce six or seven bolls each acre; but in an ordinary season they seldom reach above two or two and a half. Hence, in a moist climate, which all the west of Britain is, red clover seems a more beneficial crop than pease; as it makes as good winter food as pease, and can be cut green thrice during summer.

A field intended for cold seed ought to be ploughed in October or November; and in February, as soon as the ground is dry, the seed ought to be sown on the winter furrow. A field intended for hot seed ought to be ploughed in March or April, immediately before sowing. But,

if infested with weeds, it ought to be also ploughed in October and November.

Pease laid a foot below the surface will vegetate; but the most approved depth is six inches in light soil, and four inches in clay soil; for which reason they ought to be sown under furrow when the ploughing is delayed till spring. Of all grains, beans excepted, they are the least in danger of being buried. Pease differ from beans in loving a dry soil and a dry season. Horse-hoeing has little effect when the plants are new sprung; and, when they are advanced, their length prevents it. Fast growing at the same time is the cause of their carrying so little seed: the seed is buried among the leaves; and the sun cannot penetrate to make it grow and ripen. The only practicable remedy to obtain grain is thin sowing; but thick sowing produces more straw, and mellows the ground more. Half a boll for an English acre may be reckoned thin sowing; three firlots, thick sowing.

Notwithstanding what is said above, Mr. Hunter of Berwickshire, some years ago, began to sow all his pease in drills; and never failed to have great crops of pease, as well as of straw. He sowed double rows at a foot interval, and two feet and a half between the double rows, which admit horse-hoeing. By that method he had also good crops of beans on light land.

Pease and beans mixed are often sown together, in order to catch different seasons. In a moist season, the beans make a good crop; in a dry season, the pease.

The growth of plants is commonly checked by drought in the month of July, but promoted by rain in August. In July grass is parched; in August it recovers verdure. Where pease are so far advanced in the dry season that the seeds begin to form, their growth is indeed checked, but the seed continues to fill. If only in the blossom at that season, their growth is checked a little; but they become vigorous again in August, and continue growing without filling till stopped by frost. Hence it is that cold seed, which is early sown, has the best chance to produce corn; hot seed, which is late sown, has the best chance to produce straw.

The following method is practised in Norfolk, for sowing pease upon a dry light soil, immediately opened from pasture. The ground is pared with a plough extremely thin, and every sod is laid exactly on its back. In every sod a double row of holes is made. A pea dropt in every hole lodges in the flayed ground immediately below the sod, thrusts its roots horizontally, and has sufficient moisture. The most common mode of sowing pease is broad-cast; but the advantages of the row culture in the case of a crop early committed to the soil must be obvious. The best farmers, therefore, sow pease in drills either after the plough, the seed being deposited commonly in every second or third furrow, or if the land is in a pulverised state by drawing drills with a machine or by ribbing. In Norfolk and Suffolk pease are generally dibbled on the back of the furrow, sometimes one and sometimes two rows on each; but dibbling in no manner ap-

pears to us so well suited for a farmer's purpose as the drill. In Kent, where immense quantities of pease are grown both for gathering green and for selling ripe to the seedsmen, they are generally sown in rows from eighteen inches to three feet asunder, according to the kind, and well cultivated between.

The after culture is that of hoeing, either by hand or horse. Where the former method prevails, it is the general custom to have recourse to two hoeings; the first when the plants are about two or three inches in height, and again just before the period in which they come into blossom. In this way the vigorous vegetation of the young crop is secured, and a fresh supply of nourishment afforded for the setting of the pods and the filling of the pease. At the last of these operations the rows should be laid down, and the earth well placed up to them, the weeds being previously extirpated by hand labor. It has been stated that in some parts of Kent, where this sort of crop is much grown, it is the practice, when the distance of the rows is sufficiently great, to prevent the vegetation of weeds, and forward the growth of pea crops, by occasionally horse-hoeing, and the use of the brake-harrow, the mould being laid up to the roots of the plants at the last operation by fixing a piece of wood to the harrow. This should, however, only be laid up on one side, the pease being placed up to that which is most exposed to the sun. When pea crops become ripe they wither and turn brown in the haulm or straw, and the pods open. In this state they should be cut as soon as possible, in order that there may be the least loss sustained by their shedding. In early crops the haulm is hooked up into loose open heaps, which, as soon as they are perfectly dry, are removed from the ground and put into stacks for the purpose of being converted to the food of animals, on which they are said to thrive nearly as well as on hay. When intended for horses, the best method would seem to be that of having them cut into chaff and mixed with their other food.

Young says that forward white pease will be fit to cut early in July; if the crop is very great they must be hooked; but if small, or only middling, mowing will be sufficient. The stalks and leaves of pease being very succulent, they should be taken good care of in wet weather: the tufts, called wads or heaps, should be turned, or they will receive damage. White pease should always be perfectly dry before they are housed, or they will sell but indifferently, as the brightness and plumpness of the grain are considered at market more than with hog-pease. The straw also, if well harvested, is very good fodder for all sorts of cattle and for sheep; but if it receives much wet, or if the heaps are not turned, it can be used only to litter the farmyard with. It is the practice in some districts to remove the haulm as soon as it has been cut up by hooks constructed with sharp edges for the purpose, to every fifth ridge, or even into an adjoining grass field, in order that it may be the better cured for use as cattle food, and at the same time allow of the land being immediately prepared for the

succeeding crop. When wet weather happens, whilst the pease lie in wads, it occasions a considerable loss, many of them being shed in the field, and of those that remain a great part will be so considerably injured as to render the sample of little value. This inability in pease to resist a wet harvest, together with the great uncertainty throughout their growth, and the frequent inadequate return in proportion to the length of haulm, has discouraged many farmers from sowing so large a portion of this pulse as of other grain; though on light lands, which are in tolerable heart, the profit, in a good year, is far from inconsiderable.

The threshing of pease requires little labor. Where the haulm is wished to be preserved entire it is best done by hand; as the threshing machine is apt to reduce it to chaff. But where the fodder of pease is to be given immediately to horses on the spot, the breaking it is no disadvantage. The produce in ripened seeds is supposed by some to be from three and a half to four quarters the acre; others, as Donaldson, imagine the average of any two crops together not more than about twelve bushels; and that on the whole, if the value of the produce be merely attended to, it may be considered as a less profitable crop than most others. But, as a means of ameliorating and improving the soil at the same time, it is esteemed of great value. As to the produce in green pease, in the husk, the average of the early crops in Middlesex is supposed to be from about twenty-five to thirty sacks the acre, which, selling at from 8s. to 18s. the sack, afford about £18 the acre. The author of the Synopsis of Husbandry, however, states the produce about Dartford, at about forty sacks the acre, though, he says, fifty have sometimes been gathered from that space of land. The produce of pease in straw is very uncertain. In flour it is as three to two of the bulk in grain, and husked and split for soups as four to two. 1000 parts of pea flour afforded Sir H. Davy 574 parts of nutritive or soluble matter, viz. 501 of mucilage or vegetable animal matter, twenty-two of sugar, thirty-five of gluten, and sixteen of insoluble extract.

SECT. II.—OF PLANTS CULTIVATED FOR ROOTS.

Turnips delight in a gravelly soil, and can be raised to great perfection, and without the least hazard of miscarrying. At the same time there is no soil but will bear turnips, when well prepared. No agriculturist ever deserved better of a country than he who first cultivated turnips in the field. No plant is better fitted for the climate of Britain, no plant prospers better in the coldest part of it, and no plant contributes more to fertility. In a word, there has not for two centuries been introduced a more valuable improvement.

Of all roots, turnips require the finest mould; and, to that end, of all harrows frost is the best. To give access to frost, the land ought to be prepared by ribbing after harvest, as above directed in preparing land for barley. If the field be not subject to annuals, it may lie in that state till the end of May; otherwise the weeds must

be destroyed by a breaking about the middle of April, and again in May, if weeds arise. The first week of June plough the field with a shallow furrow. Lime it if requisite, and harrow the lime into the soil. Draw single furrows, with intervals of three feet, and lay dung in the furrows. Cover the dung sufficiently, by going round it with the plough, and forming the three feet spaces into ridges. The dung comes thus to lie below the crown of every ridge.

The season of sowing must be regulated by the time intended for feeding. When intended for feeding in November, December, January, and February, the seed ought to be sown from the 1st to the 20th of June. Where the feeding is intended to be carried on to March, April, and May, the seed must not be sown till the end of July. Turnips sown earlier than above directed flower that very summer, and run fast to seed; which renders them unfit for food. If sown much later, there is no food but from the leaves. Though by a drill plough the seed may be sown of any thickness, the safest way is to sow thick. Thin sowing is liable to many accidents, which are far from being counterbalanced by the expense that is saved in thinning. Thick sowing can bear the ravages of the black fly, and leave a sufficient crop behind. It is a protection against drought, gives the plants a rapid progress, and establishes them in the ground before it is necessary to thin them.

The sowing turnips broad-cast is universal in England, and common, though a barbarous practice, in Scotland. The eminent advantages of turnips is, that, besides a profitable crop, they make a most complete fallow; and the latter cannot be obtained but by horse-hoeing. Upon that account, the sowing turnips in rows at three feet distance is recommended. Wider rows answer no profitable end; straiter rows afford not room for a horse to walk in. When the turnips are about four inches high, annual weeds will appear. Go round every interval with the slightest furrow possible, two inches from each row, moving the earth from the rows towards the middle of the interval. A thin plate of iron must be fixed on the left side of the plough, to prevent the earth from falling back and burying the turnips. Let women weed the rows with their fingers; which is better and cheaper than with the hand hoe, which is also apt to disturb the roots of the turnips that are to stand, and to leave them open to drought by removing the earth from them. The standing turnips are to be twelve inches from each other: a greater distance makes them swell too much; less affords them not sufficient room. A woman soon comes to be expert in weeding. The following hint may be necessary to a learner. To secure the turnip that is to stand, let her cover it with the left hand, and with the right pull up the turnip on both sides. After thus freeing the standing turnip, she may safely use both hands. Let the field remain in this state till the appearance of new annuals make a second ploughing necessary; which must be in the same furrow with the former, but deeper. As in this ploughing the iron plate is removed, part of the loose earth

will fall back on the roots of the plants: the rest will fill the middle of the interval, and bury every weed. When weeds begin again to appear, then is the time for a third ploughing in an opposite direction, which lays the earth to the roots of the plants. This ploughing may be about the middle of August; after which weeds rise very faintly. If they do rise, another ploughing will clear the ground of them. Weeds that at this time rise in the row, may be cleared with a hand-hoe, which can do little mischief among plants twelve inches from each other. But it may be done cheaper with the hand. And after the leaves of turnips in a row meet together, the hand is the only instrument that can be applied for weeding.

In swampy ground, the surface of which is best reduced by paring and burning, the seed may be sown in rows with intervals of a foot. To save time, a drill plough may be used that sows three or four rows at once. Hand-hoeing is proper for such ground; because the soil under the burnt stratum is commonly full of roots, which digest and rot better under ground than when brought to the surface by the plough. While these are digesting, the ashes will secure a good crop. In cultivating turnips, care should be taken to procure good, bright, nimble, and well dried seed, and of the best kinds. The Norfolk farmers generally raise the oval white, the large green topped, and the red or purple topped kinds, which from long experience they have found most profitable. The roots of the green topped will grow to a large size, and continue good much longer than others. The red or purple topped will also grow large, and continue good till February; but the roots become hard and stringy sooner than the former. The green topped, growing more above ground, is in more danger of injury from severe frosts than the red or purple, which are more than half covered by the soil; but it is the softest and sweetest, when grown large, of any kind. They are brought to table a foot in diameter, as good as garden turnips.

Turnips delight in a light soil, of sand and loam mixed. When the soil is rich and heavy, although the crop may be as weighty, they will be rank, and run to flower earlier in spring. Turnip seed will not do well without frequent changing. The Norfolk seed is sent to most parts of the kingdom, and even to Ireland, but after two years it degenerates; so that those who wish to have turnips in perfection should procure it fresh every year from Norwich, to prevent being imposed upon by seed of that name inferior in quality.

When the plants have got five leaves, they should be hoed, and set out at least six inches apart. A month afterward, or earlier if it be a wet season, a second hoeing should take place, and the plants be left at least fourteen inches from each other, especially if intended for feeding cattle; for, where the plants are left thicker, they will be proportionably smaller, unless the land is very rich indeed. Some of the best Norfolk farmers sow turnips in drills three feet asunder, and at a second hoeing leave them a foot apart. By these means the trouble and ex-

pense of hoeing is much lessened, and the crop of equal weight as when sown in the common method. The intervals may easily be cleared of weeds by the horse-hoe. Great quantities of turnips are raised in Norfolk every year for feeding black cattle, which turn to great advantage. An acre of land contains 4840 square yards, or 43,560 square feet. If then every square foot contains one turnip, and they weigh only two pounds each, here will be a mass of excellent food of forty-six tons per acre, worth from four to five guineas and sometimes more.

Extraordinary crops of barley frequently succeed turnips, especially when fed off the land. In feeding them off, the cattle should not be suffered to run over too much of the ground at once; for in that case they will tread down and spoil twice as many as they eat. In Norfolk they are confined by hurdles to as much as is sufficient for them for one day. By this mode the crop is eaten clean, the soil is equally trodden, which if light is of much service, and equally manured by the cattle. A notion prevails, in many places, that mutton fattened with turnips is thereby rendered rank and ill tasted; but this is a vulgar error. The best mutton in Norfolk is all fed with turnips. Rank pastures, and marshy lands produce rank mutton. If the land be wet and spongy, the best method is to draw and carry off your turnips to some dry pasture; for the treading of the cattle will not only injure the crop, but render the land so stiff that you must be at an additional expense in ploughing. To preserve turnips for late spring seed, the best method, and which has been tried with success by some of the best English farmers, is to stalk them up in dry straw; a load of which is sufficient to preserve forty tons of turnips. The method is easy, and is as follows:—After drawing your turnips in February, cut off the tops and tap roots (which may be given to sheep), and let them lie a few days in the field. Then, on a layer of straw next the ground, place a layer of turnips two feet thick; then another layer of straw, and so on alternately, till you have brought the heap to a point. Care must be taken to turn up the edges of the layers of straw, to prevent the turnips from rolling out; cover the top well with long straw, and it will serve as a thatch for the whole. In this method, as the straw imbibes the moisture exhaled from the roots, all vegetation will be prevented, and the turnips will be nearly as good in May as when first drawn from the field. If straw be scarce, old haulm or stubble will answer the same purpose. But, to save this trouble and expense, farmers in all counties would find it their interest to adopt the method used by the Norfolk farmers, which is, to continue sowing turnips to the end of August; by which means their late crops remain good in the field till the end of April, and often till the middle of May. The advantages of having turnips good till the spring seed is ready, are so obvious and great, that many of the most intelligent farmers are now come into it, and find their account in so doing.

2. POTATOES.—The choice of soil is not of greater importance for any other plant than for potatoes. This plant in clay soil, or in rank

black loam lying low without ventilation, never makes palatable food. In a gravelly or sandy soil, exposed to the sun and free air, it thrives to perfection, and has a good relish. But a rank black loam, though improper to raise potatoes for the table, produces them in great plenty; and the product is a palatable food for horned cattle, hogs, and poultry. The spade is a proper instrument for raising a small quantity, or for preparing corners or other places inaccessible to the plough; but, for raising potatoes in quantities, the plough is the only instrument.

As two great advantages of a drilled crop are, to destroy weeds, and to have a fallow at the same time with the crop, no judicious farmer will think of raising potatoes in any other way. In September or October, as soon as that year's crop is removed, let the field have a rousing furrow, a cross brakeing next, and then be cleared of weeds by the cleaning harrow.—Form it into three feet ridges, in that state to lie till April, which is the proper time for planting potatoes. Cross brake it, to raise the furrows a little. Then lay well digested horse dung along the furrows, upon which lay the roots eight inches distant. Cover up these with the plough, going once round every row. This makes a warm bed for the potatoes; hot dung below and a loose covering above, that admits every ray of the sun. As soon as the plants appear above ground, go round every row a second time with the plough, which will lay upon the plants an additional inch or two of mould, and at the same time bury all the annuals; and this will complete the ploughing of the ridges. When the potatoes are six inches high, the plough, with the deepest furrow, must go twice along the middle of each interval in opposite directions, laying earth first to one row, and next to the other. And to perform this work, a plough with a double mould board will be more expeditious; but, as the earth cannot be laid close to the roots by the plough, the spade must succeed, with which four inches of the plants must be covered, leaving little more but all the tops above ground; and this operation will bury all the weeds that have sprung since the former ploughing. What weeds arise after, must be pulled up by the hand. A hoe is never to be used here.

In the Bath Society Papers, we have the following practical observations on the culture and use of potatoes, given as the result of various experiments made for five years successively.

When the potatoe crop has been the only object in view, the following method is the most eligible:—The land being well pulverised by two or three good harrowings and ploughings, is then manured with fifteen or twenty cart loads of dung per acre, before it receives its last earth. Then it is thrown on to what the Suffolk farmers call the trench balk, which is narrow and deep ridge work, about fifteen inches from the centre of one ridge to the centre of the other. Women and children drop the sets in the bottom of every furrow fifteen inches apart; men follow and cover them with large hoes, a foot in width, pulling the mould down so as to bury the sets five inches deep; they must receive two or three hand hoeings, and be kept free from weeds; al-

ways observing to draw the earth as much as possible to the stems of the young plants. The first or second week in April is the most advantageous time for planting.

In the end of September or beginning of October, when the haulm becomes withered, they should be ploughed up with a strong double breasted plough. The workman must be cautioned to set his plough very deep, that he may strike below all the potatoes, to avoid damaging the crop. The women who pick them up, if not carefully attended to, will leave many in the ground, which will prove detrimental to any succeeding crop. To avoid which, let the land be harrowed, and turn in the swine to glean the few that may be left. By this method, the sets will be fifteen square inches from each other; it will take eighteen bushels to plant an acre; and the produce, if on a good mixed loamy soil, will amount to 300 bushels. If the potatoes are planted as a preparation for wheat, it is preferable to have the rows two feet two inches from each other, hand-hoeing only the space from plant to plant in each row; then turning a small furrow from the inside of each row by a common light plough, and afterwards with a double breasted plough with one horse, split the ridge formed by the first ploughing thoroughly to clean the intervals. This work should not be done too deep the first time, to avoid burying the tender plants; but the last earth should be ploughed as deep as possible; and the closer the mould is thrown to the stems of the plants the better. Thus fifteen bushels will plant an acre, and the produce will be about 300 bushels; and the land, by the summer ploughings, will be prepared to receive seed wheat immediately, and almost ensure a plentiful crop. The potatoe sets should be cut a week before planting, with one or two eyes to each, and the pieces not very small; two bushels of fresh slaked lime should be sown over the surface of the land as soon as planted, which will effectually prevent the attacks of the grub.

A premium having been offered by the above Society for the cultivation of potatoes by farmers, &c., whose rent does not exceed £40 per annum, the following methods were communicated, by which those who have only a small spot of ground may obtain a plentiful crop.

The earth should be dug twelve inches deep, if the soil will allow of it: after this, a hole should be opened about six inches deep, horse dung, or long litter should be put therein about three inches thick; this hole should not be more than twelve inches in diameter; upon this dung or litter, a potatoe should be planted whole, upon which a little more dung should be shook, and then earth put thereon. In like manner the whole plot of ground must be planted, taking care that each potatoe be at least sixteen inches apart; and, when the young shoots make their appearance, they should have fresh mould drawn round them with a hoe; and if the tender shoots are covered, it will prevent the frost from injuring them; they should again be earthed when the shoots make a second appearance, but not be covered, as the season will then be less severe. A plentiful supply of mould should be given

them, and the person who performs this business should never tread upon the plant, or the hillock that is raised round it; as, the lighter the earth is, the more room the potatoe will have to expand. From a single root thus planted, very nearly forty pounds of large potatoes were obtained, and from almost every other root upon the same plot, from fifteen to twenty pounds; and, unless the soil be stony or gravelly, ten pound, or half a peck of potatoes may almost always be obtained from each root, by pursuing the above method. But cuttings or small sets will not do for this purpose.

The second method will suit those who have not time to dig their ground. Where weeds much abound, and have not been cleared in the winter, a trench may be opened in a straight line the whole length of the ground, and about six inches deep; in this trench the potatoes should be planted about ten inches apart; cuttings or small potatoes will do for this method. When they are laid in the trench, the weeds that are on the surface may be pared off on each side about ten inches from it, and be turned upon the plants; another trench should then be dug, and the mould that comes out of it turned on the weeds. Each trench should be regularly dug, that all the potatoes may be ten or twelve inches from each other. This method will raise more potatoes than can be produced by digging the ground twice, and dibbling in the plants; as the weeds lighten the soil, and give the roots room to expand. They should be twice hoed, and earthed up in rows. If cut potatoes are to be planted, every cutting should have two eyes, for, though fewer sets will be obtained, there will be a greater certainty of a crop, as one eye often fails. Where a crop of potatoes fails in part, remedies may still be made by laying a little dung upon the knots of the straw or haulm of those potatoes that do appear, and covering them with mould; each knot or joint thus ordered, will, if the weather prove wet afterwards, produce more potatoes than the original roots. From the smallest potatoes planted whole, from four to six pound a root were obtained, and some of the single potatoes weighed nearly two pound. These were dug in, in trenches where the ground was covered with weeds, and the soil was a stiff loamy clay.

A good crop may be obtained by laying potatoes upon turf at about twelve or fourteen inches apart, and upon beds of about six feet wide; on each side of which a trench should be opened about three feet wide, and the turf that comes thence should be laid with the grassy side downwards upon the potatoes; a spot of mould should next be taken from the trenches, and be spread over the turf; and in like manner the whole plot of ground that is to be planted must be treated. When the young shoots appear, another spot of mould from the trenches should be strewed over the beds, to cover the shoots; this will prevent the frost from injuring them, encourage them to expand, and totally destroy the young weeds. When the potatoes are taken up in the autumn, turn the earth again into the trenches, so as to make the surface level.

For field planting, a good method is to dung

the land, which should be once ploughed previous thereto; and, when ploughed a second time, the potatoe plants should be dropped before the plough in every third furrow, about eight or ten inches apart. Plants that are cut with two eyes are best for this purpose. The reason for planting them at so great a distance as every third furrow, is, that when the shoots appear, a horse hoe may go upon the two vacant furrows to keep them clean; and, after they are thus hoed, they should be moulded up in ridges; and, if this crop be taken up about October or November, the land will be in excellent condition to receive a crop of wheat. Lands that are full of twitch or couch grass, may be made clean by this method, as the horse-hoeing is as good as a summer fallow; and if, when the potatoes are taken up, women and children were to pick out such filth, no traces of it would remain; and by burning it a quantity of manure would be procured. After ploughing, none should ever dabble in potatoes, for treading the ground.

Vacant places in hedge rows might be grubbed and planted with potatoes, and a good crop might be expected, as the leaves of trees, thorns, &c., are a good manure, and will surprisingly encourage their growth, and gratify the wishes of the planter; who, by cultivating such places, will then make the most of his ground, and it will be in fine order to receive a crop of corn the following year.

The best method of taking up potatoes is to plough once round every row at the distance of four inches, removing the earth from the plants, and gathering up with the hand all the potatoes that appear. This distance is proper to prevent cutting the roots. When the ground is thus cleared by the plough, raise the potatoes with a fork having three broad toes. The potatoes must then be gathered with the hand.

It is of importance to have potatoes all the year round. For a long time they were in Scotland confined to the kitchen garden; and, after they were planted in the field, it was not supposed at first that they could be used after December. Of late they have been kept good till April. But it is easy to preserve them till the next crop: when taken out of the ground, lay in a corner of a barn a quantity that may serve till the spring covered with dry straw pressed down: bury the remainder in a hole dug in dry ground, mixed with the husks of dried oats, sand, or the dry leaves of trees, over which build a stack of hay or corn. When the pit is opened for taking out the potatoes, the eyes of what have tendency to push must be cut out; and this cargo will serve till the end of June. To be certain of making the old crop meet the new, the setting of a small quantity may be delayed till June, to be taken up at the ordinary time before frost. This cargo, having not arrived to full growth, will not be so ready to push as what are set in April. If the old crop be exhausted before the new crop is ready, the interval may be supplied by the potatoes of the new crop that lie next the surface, to be picked up with the hand; which, far from hurting the crop, will rather improve it.

Einhoff found mealy potatoes to contain twenty-four per cent. of their weight of nutritive mat-

er, and rye seventy parts. Consequently sixty-four and a half measures of potatoes afford the same nourishment as twenty-four measures of rye. 1000 parts of potatoe yielded to Sir H. Davy from 200 to 360 parts of nutritive matter, of which from 155 to 200 were mucilage or starch, fifteen to twenty sugar, and thirty to forty gluten. Now, supposing an acre of potatoes to weigh nine tons, and one of wheat one ton, which is about the usual proportion, then as 1000 parts of wheat afford 950 nutritive parts, and 1000 of potatoe say 230, the quantity of nutritive matter afforded by an acre of wheat and potatoes will be nearly as nine to four; so that an acre of potatoes will supply more than double the quantity of human food afforded by an acre of wheat. The potatoe is perhaps the only root grown in Britain which may be eaten every day in the year without satiating the palate, and the same thing can only be said of the West Indian yam, and bread fruit. They are, therefore, the only substitute that can be used for bread with any degree of success, and indeed they often enter largely into the composition of the best loaf bread without at all injuring either its nutritive qualities or flavor. In the answer by Dr. Tissot to M. Linquet, the former objects to the constant use of potatoes as food, not because they are pernicious to the body, but because they hurt the faculties of the mind. He owns that those who eat maize, potatoes, or even millet may grow tall and acquire a large size; but doubts if any such ever produced a literary work of merit. Potatoe meal may be preserved for years closely packed in barrels, or unground in the form of slices; these slices having been previously cooked or dried by steam, as originally suggested by Forsyth of Edinburgh. Some German philosophers have also proposed to freeze the potatoe, by which the feculous matter is separated from the starch, and the latter, being then dried and compressed, may be preserved for any length of time, or exported with ease to any distance. (*Annalen des Ackerbaues*, vol. iii. s. 389).

Potatoes as food for live stock are often joined with hay, straw, chaff, and other similar matters, and have been found useful in many cases, especially in the later winter months, for horses, cows, &c. With these substances, as well as in combination with other materials, as bean or barley-meal and pollard, they are also used in the fattening of neat cattle, sheep, and hogs. Potatoes are much more nutritive when boiled; they were formerly cooked in this way, but are now very generally steamed, especially in the north. The practice has been carried to the greatest extent by Curwen in feeding horses. He gives to each horse, daily, one and a half stone of potatoes mixed with a tenth of cut straw: 120 stones of potatoes require two and a quarter bushels of coals to steam them. An acre of potatoes, he considers, goes as far in this way as four of hay. Von Thaer found them, when given to live-stock, produce more manure than any other food: 100 lbs. of potatoes producing sixty-six pounds of manure of the very best description. The baking of potatoes in an oven has also been tried with success (*Comm. Board of Agriculture*, vol. iv.); but the process seems too

expensive. They are also given raw to stock of every description, to horses and hogs washed, but not washed to cows or oxen. Washing was formerly a disagreeable and tedious business, but is now rendered an easy matter, whether on a large or small scale, by the use of the washing machine.

3. CARROTS and PARSNIPS.—Of all roots a carrot requires the deepest soil. It ought at least to be a foot deep, all equally good from top to bottom. If such a soil be not in the farm, it may be made artificially by trench ploughing, which brings to the surface what never had any communication with the sun or air. When this new soil is sufficiently improved by a crop or two with dung, it is fit for bearing carrots. Beware of dunging the year when the carrots are sown; for with fresh dung they seldom escape rotten scabs. The only soils proper for carrots are loam and sand. The ground must be prepared by the deepest furrow that can be taken, the sooner after harvest the better; immediately upon the back of which, a ribbing ought to succeed, as directed for barley. At the end of March, or beginning of April, which is the time of sowing the seed, the ground must be smoothed with a rake. Sow the seed in drills, with intervals of a foot for hand-hoeing, where the crop is an acre or two: but if the quantity of ground be greater, the intervals ought to be three feet for horse-hoeing. In flat ground without ridges, it is proper to make parallel furrows with the plough, ten feet asunder to carry off redundant moisture. The farmer will often find carrots a very advantageous crop; instances are given of their excellence as food for horses, cattle, and hogs.

The culture of PARSNIPS is much the same with that of carrots.

SECT. III.—PLANTS CULTIVATED FOR LEAVES, OR FOR LEAVES AND ROOTS.

The plants proper for the field of these kinds are cabbage red and white, colewort plain and curled, turnip-rooted cabbage, and the root of scarcity.

1. CABBAGE is an interesting article in husbandry. It is easily raised, is subject to few diseases, resists frost more than turnips, is palatable to cattle, and sooner fills them than turnips, carrots, or potatoes. The season for setting cabbage depends on the use it is intended for. If intended for feeding in November, December, and January, plants procured from seed sown the end of July the preceding year must be set in March or April. If intended for feeding in March, April, and May, the plants must be set the first week of the preceding July, from seed sown in the end of February or beginning of March the same year. The late setting of the plants retards their growth; by which means they have a vigorous growth the following spring. And this crop makes an important link in the chain that connects winter and summer green food. Where cabbage for spring food is neglected, a few acres of rye sown at Michaelmas will supply the want. After the rye is consumed there is time sufficient to prepare the ground for turnips.

Where cabbage plants are to be set in March, the field must be made up after harvest in ridges

three feet wide. In that form let it lie all winter to be inellowed with air and frost. In March take the first opportunity, between wet and dry, to lay dung in the furrows. Cover the dung with a plough, which will convert the furrow into a crown, and the crown into a furrow. Set the plants upon the dung, three feet from each other. Plant them so as to make a straight line cross the ridges, and along the furrows, to which a gardener's line stretched perpendicularly cross the furrows will be requisite. This will set each plant at the distance precisely of three feet from the plants that surround it. The purpose of this is to give opportunity for ploughing, not only along the ridges, but across them. This mode saves hand-hoeing, is a more complete dressing to the soil, and lays earth neatly round every plant. If the soil be deep and composed of good earth, a trench ploughing after the preceding crop will be proper; in which case the time for dividing the field into three feet ridges ought immediately to precede the dunging for the plants. If weeds rise so close to the plants as not to be reached by the plough, destroy them with a hand-hoe. Unless the soil be much infested with annual weeds, twice ploughing after the plants are set will be a sufficient dressing. The first removes the earth from the plants; the next, at the distance of a month or so, lays it back.

Where the plants are to be set in July, the field must be ribbed as directed for barley. It ought to have a slight ploughing in June before the planting, to loosen the soil, but not so as to bury the surface earth; after which the three feet ridges must be formed, and the other particulars carried on as directed above with respect to plants set in March.

2. As to the *turnip-rooted cabbages*, in the Bath Society Papers we have the following account of Sir Thomas Beevor's method of cultivating them, which he found to be cheaper and better than any other:—In the first or second week in June I sow the same quantity of seed, hoe the plants at the same size, leave them at the same distance from each other, and treat them in all respects like the common turnip. In this method I have always obtained a plentiful crop of them; to ascertain the value of which I need only inform you that, on the 23d of April last, having then two acres left of my crop, sound, and in good perfection, I divided them by fold hurdles into three parts of nearly equal dimensions. Into the first part I put twenty-four small bullocks of about thirty stone weight each (fourteen pounds to the stone), and thirty middle-sized fat widders, which, at the end of the first week, after they had eaten down the greater part of the leaves, and some part of the roots, I shifted into the second division, and then put seventy lean sheep into what was left of the first; these fed off the remainder of the turnips left by the fat stock; and so they were shifted through the three divisions, the lean stock following the fat as they wanted food, until the whole was consumed. The twenty-four bullocks and the thirty fat widders continued in the turnips until the 21st of May, and the seventy lean sheep until the 29th, which is one day over four weeks: so that the

two acres kept me twenty-four small bullocks and 110 sheep four weeks, not reckoning the overplus day of keeping the lean sheep; the value, at the rate of keeping at that season, cannot be estimated in any common year at less than 4*d.* a week for each sheep, and 1*s.* 6*d.* per week for each bullock, which would amount together to the sum of £14 10*s.* 8*d.* for the two acres.

'You will observe that, in the valuation of the crop above mentioned, I have claimed no allowance for the great benefit the farmer receives by being enabled to suffer his grass to get into a forward growth, nor for the superior quality of these turnips in fattening his stock; both which circumstances must stamp a new and a great additional value upon them. But, as their continuance on the land may seem to be injurious to the succeeding crop, to supply that loss I have always sown buck-wheat on the first earth upon the land from which the turnips were thus fed off; allowing one bushel of seed per acre, for which I commonly receive from five to six quarters per acre in return. Thus you see that, in providing a most incomparable vegetable food for cattle, in that season of the year in which the farmer is generally most distressed, and his cattle almost starved, a considerable profit may likewise be obtained, much beyond what is usually derived from his former practice, by the great produce and price of a crop raised at so easy an expense as that of the buck-wheat, which with us sells commonly at the same price as barley, oftentimes more, but very rarely for less. The land on which I have usually sown turnip-rooted cabbages is a dry mixed soil, worth 15*s.* per acre.'

To the preceding account the Society have subjoined the following note:—'Whether we regard the importance of the subject, or the clear and practical information which the foregoing letter conveys, it may be considered as truly interesting as any we have ever been favored with: and therefore it is recommended in the strongest manner to farmers in general, that they adopt a mode of practice so decisively ascertained to be in a high degree judicious and profitable.'

To raise the turnip-rooted cabbage for transplanting, the best method yet discovered is to breast-plough and burn as much old pasture as may be judged necessary for the seed-bed: two perches well stocked with plants will be sufficient to plant an acre. The land should be dug as shallow as possible, turning the ashes in; and the seed should be sown the beginning of April. The land to be cultivated and dunged as the common turnip. About midsummer will be a proper time for planting, which is best done as follows:—The land to be thrown into one-bout ridges, upon the tops of which the plants are to be set, about eighteen inches from each other. As soon as the weeds rise give a hand-hoeing, afterwards run the ploughs in the intervals, and fetch a furrow from each ridge, which, after lying two or three weeks, is again thrown back to the ridges; if the weeds rise again give them another hand-hoeing. If the young plants in the seed-bed be attacked by the fly, sow wood-ashes over them when the dew is on which will prevent their ravages.

3. *The racine de disette*, or Root of SCARCITY, beta cicla (see BETA), delights in a rich loamy land well dunged. It is directed to be sown in rows, or broad-cast, and as soon as the plants are of the size of a goose-quill, to be transplanted in rows of eighteen inches distance, and eighteen inches apart, one plant from the other: care must be taken in the sowing to sow very thin, and to cover the seed, which lies in the ground about a month, an inch only. In transplanting the root is not to be shortened, but the leaves cut at the top; the plant is then to be planted with a setting stick, so that the upper part of the root shall appear about half an inch out of the ground; this last precaution is necessary to be attended to. These plants will strike root in twenty-four hours, and a man will plant with ease 1800 or 2000 a day. In the seed-bed the plants, like all others, must be kept clear of weeds: when planted out, after once hoeing, they will suffocate every kind of weed near them.

The best time to sow the seed is from the beginning of March to the middle of April: but some continue sowing every month until the beginning of July, to have a succession of plants. Both leaves and roots have been extolled as excellent both for man and beast. This plant is said not to be liable, like the turnip, to be destroyed by insects; for no insect touches it, nor is it affected by excessive drought, or the changes of seasons. Horned cattle, horses, pigs, and poultry, are exceedingly fond of it when cut small. The leaves may be gathered every twelve or fifteen days; they are from thirty to forty inches long, by twenty-two to twenty-five inches broad. This plant is excellent for milch cows, when given to them in proper proportions, as it adds much to the quality as well as quantity of their milk; but care must be taken to proportion the leaves with other green food, otherwise it would abate the milk, and fatten them too much, they being of so exceedingly fattening a quality.

4. OF TARES.—The common tare is distinguished into the winter and spring tare, probably the same original plant; but a material difference has been superinduced by cultivation. (*Annals of Agriculture*, vol. ii). The winter tare escapes injury from frosts, which destroy the spring variety: the difference in the seeds is, however, so inconsiderable, as to be scarcely distinguished; but 'the winter-tare vegetates with a seed leaf of a fresh green color, whereas the spring tare comes up with a grassy spear of a brown dusky hue.'—*Dickson's Practical Agriculture*.

The winter variety is sown in September and October, and the first sowing in spring ought to be early. If they are to be cut green for soiling throughout the summer and autumn, which is the most advantageous method of consuming them, successive sowings should follow till the end of May. The quantity of seed to an acre is from two bushels and a half to three bushels and a half, according to the time of sowing, and as they are to be consumed green or left to stand for a crop.

Tares are in some places eaten on the ground, particularly by sheep: and, as the winter sown variety comes early, the value of this food is then

very considerable. The waste, however, in this way, even though the sheep be confined in hurdles, is great: and still greater when consumed by horses or cattle. But if the plants be cut green, and given to stock either on the field or in the fold-yards, there is perhaps no green crop of greater value.

A little rye sown with winter tares, and a few oats with the spring sort, serve to support their weak stems, and add to the bulk of the crop. There is little difference in the culture of tares and peas; they are often sown broad-cast, but sometimes in rows, with intervals to admit of hand-hoeing. The land ought to be rolled as a preparation; and they should always be cut with the scythe, rather than a sickle. When thus cut with the scythe, even an early spring sown crop sometimes yields a weighty after crop. In those districts where winter sown tares are found to succeed, the ground may be cleared in time for being sown with turnips, or dressed like a fallow for wheat.

5. OF RAPE-SEED.—Rape is cultivated to a large extent in Great Britain, not only for the sake of the oil, but also for feeding sheep. The late Mr. Culley of Northumberland gives the following account of its culture, founded on his own practice:—

'Rape may be sown from the 24th of May to the 8th of June: but comes to the greatest growth if sown in May. If sown earlier it is apt to run to seed. From two to three pounds of seed is required per acre, sown by a common turnip-seed drill. But, as rape-seed is so much larger than turnip-seed, the drill should be wider. When hoed the rape should be set out at the same distance as turnip plants. The drills should be from twenty-six to twenty-eight or thirty inches, according to the quantity of dung given. As many ploughings, harrowings, and rollings, &c., should be given, as may be necessary to make that kind of poor soil as fine as possible, and cleared of twigs, &c.: the produce will be from twenty-five to even fifty tons per acre, or upwards. But it is not so much the value of the green crop (though the better the green crop, the better will the wheat be) as the great certainty of a valuable crop of wheat, that merits attention. The sheep are put on from the beginning to the middle of August; they must have the rape consumed by the middle, or at latest by the end of September, so that the wheat may be got sown, on such poor damp soils, before the autumnal rains take place. The number of sheep must depend on the goodness or badness of the crop. But as many sheep must be employed as to eat the rape by the middle of September, or end of that month at the latest, for the reasons formerly given. The Burwell red wheat (so called from a village in Cambridgeshire) is always preferred. Poor clays will not allow deep ploughing, consequently that operation must be governed by the depth of the soil. The land must be made as clean as any naked fallow. There is scarcely an instance known of a crop of wheat sown after rape, and eat off with sheep, being mildestew, and the grain is generally well perfected. Mr. Culley has known a crop of wheat after rape, upon a poor moorish

'thin clay soil, worth much more than the fee-simple of the land that produced it. He has frequently known land, both after rape and after naked fallow, in the same field; and invariably the rape-wheat was better in every respect than that after naked fallow.'—*Husbandry of Scotland*, vol. ii. appendix, p. 45.

OF THE CULTURE OF GRASSES.

The end of August or the beginning of September is the best season for sowing grass-seeds, as there is time for the roots of the young plants to fix themselves before the sharp frosts set in. Moist weather is best for sowing; the earth being then warm, the seeds vegetate immediately; but if this season proves unfavorable, they will do very well in the middle of March.

Never sow on foul land; plough it well, and clear it from the roots of couch-grass, rest-harrow, fern, broom, and all other noxious weeds. If these are suffered to remain they will soon destroy the young grass. Rake these up in heaps, burn them on the land, and spread the ashes as a manure. Repeat the ploughings and harrowings in dry weather. If the soil be clayey and wet make some drains to carry off the water. Before sowing lay the land as level as possible. If the grass seeds are clean, three bushels will be sufficient per acre. When sown, harrow it in gently, and roll it in with a wooden roller. When it comes up, fill up all the bare spots with fresh seed, which, if rolled to fix it, will soon come up and overtake the rest. In Norfolk they sow clover with their grasses, particularly with rye-grass; but this should not be done except when the land is designed for grass only three or four years, because neither of these kinds will last long in the lands. Where you intend it for a continuance it is better to mix only small white Dutch clover, or marl grass with other grass seed, and not above eight pounds to an acre. These are abiding plants, spread close on the surface, and make the sweetest feeding for cattle. In spring root up thistles, hemlock, or any large weeds that appear. The doing this while the ground is soft enough to permit drawing by the roots, and before they seed, will save a vast deal of trouble afterwards.

A common method of laying down fields to grass is extremely injudicious. Some sow barley with the grasses, which they suppose to be useful in shading them, without considering how much the corn draws away the nourishment. Others take their seeds from a foul hay-rick; by which means, besides filling the land with rubbish and weeds, what they intend for dry soils may have come from moist, where it grew naturally, and vice versa. The consequence is that the ground, instead of being covered with a good thick sward, is filled with plants unnatural to it. The kinds of grass most eligible for pasture lands are, the annual meadow, creeping, and fine bent, the fox-tail, and crested dog's tail, the poas, the fescues, the vernal, oat-grass, and the rye-grass. We do not, however, approve of sowing all these kinds together; for besides their ripening at different times, by which we can never cut them all in perfection and full vigor, no cattle are fond of all alike. Horses will scarcely eat hay which oxen

and cows will thrive upon; sheep are particularly fond of some kinds, and refuse others. The dandel-grass, if not cut before several of the other kinds are ripe, becomes so hard and wiry in the stalks, that few cattle eat it. Such as wish for a particular account of the above-mentioned grasses, will be amply gratified in consulting Mr. Stillingfleet on this subject, who has treated it with great judgment and accuracy. The substance of his observations is given in our article GRASS.

The grasses commonly sown for pasture, for hay, or to be cut green for cattle, are red clover, white clover, yellow clover, rye-grass, narrow-leaved plantain called ribwort, sainfoin and lucerne. Red clover is of all the most proper to be cut green for summer food. It is a biennial plant when suffered to perfect its seed; but, when cut green, it will last three years, and in a dry soil longer. At the same time the safest course is to let it stand but a single year; if the second year's crop happen to be scanty, it proves, like a bad crop of pease, a great encourager of weeds by the shelter it affords them. Here, as in all other crops, the goodness of seed is of importance. Choose plump seed of a purple color, because it takes on that color when ripe. It is red when hurt in the drying, and of a faint color when unripe.

Red clover is luxuriant upon a rich soil, whether clay, loam, or gravel: it will grow even upon a moor, when properly cultivated. A wet soil is its only bane. To have red clover in perfection, weeds must be extirpated, and stones taken off. The mould ought to be made as fine as a harrowing can make it; and the surface smoothed with a light roller. This gives an opportunity for distributing the seed evenly; which must be covered by a small harrow with teeth not larger than that of a garden rake. In harrowing, the man should walk behind with a rope in his hand fixed to the back part of the harrow, ready to disentangle it from stones, clods, turnip or cabbage roots, which would trail the seed, and displace it.

No precise depth is necessary for the seed of red clover. It will grow vigorously from two inches deep, and it will grow when barely covered. Half an inch may be reckoned the most advantageous position in a clay soil, a whole inch in what is light or loose. It is a vulgar error that small seed ought to be sparingly covered. Misled by it, farmers cover their clover seed with a bushy branch of thorn, which not only covers it unequally, but leaves part on the surface to wither in the air. The proper season for sowing red clover is from the middle of April to the middle of May. It will spring from the first of March to the end of August; but such liberty ought not to be taken.

There cannot be a greater blunder in husbandry than to be sparing of seed. Some writers talk of sowing an acre with four pounds. That quantity of seed, say they, will fill an acre with plants as thick as they ought to stand. This rule may be admitted as to grain, but will not answer with respect to grass. Grass seed cannot be sown too thick: the plants shelter one another; they retain all the dew; and they must push for-

ward, having no room laterally. Observe the place where a sack of pease, or of other grain, has been set down for sowing : the seed dropped there accidentally grows more quickly than in the rest of the field sown thin out of hand. A young plant of clover, or of sainfoin, according to Tull, may be raised to a great size where it has room; but the field will not produce half the quantity. When red clover is sown for cutting green, there ought not to be less than twenty-four pounds to an acre. A field of clover is seldom too thick; the smaller the stem, the more acceptable it is to cattle. It is often too thin; and when so the stem tends to wood.

Red clover is commonly sown with grain; and the most proper grain is flax. The soil must be highly cultivated for flax as well as for red clover. The proper season for sowing is the same for both; the leaves of flax, being very small, admit of free circulation of air; and flax being an early crop is removed so early as to give the clover time for growing. In a rich soil it has grown so fast as to afford a good cutting that very year. Next to flax, barley is the best companion to clover. The soil must be loose and free for barley; as well as for clover: the season for sowing is the same; and the clover is well established in the ground before it is overtopped by the barley. At the same time, barley commonly is sooner cut than either oats or wheat. When clover is sown in spring upon wheat, the soil, which has lain five or six months without being stirred, is an improper bed for it; and the wheat, being in the vigor of growth, overtops it from the beginning. It cannot be sown along with oats, because of the hazard of frost; and when sown as usual among the oats three inches high, it is overtopped, and never enjoys free air till the oats be cut. Where oats are sown upon the winter furrow, the soil is rendered as hard as when under wheat. Red clover is sometimes sown by itself without other grain: but this method, besides losing a crop, is not salutary; because clover in its infant state requires shelter.

As to the quantity of grain proper to be sown with clover, in a rich soil well pulverised, a peck of barley on an English acre is all that ought to be ventured; but there is not so much soil in Scotland so rich. Two Linlithgow firlots make the proper quantity for an acre that produces six bolls of barley; half a firlot for what produces nine bolls. To some, so small a quantity may appear ridiculous. But a rich soil in good order, will, from a single seed of barley, produce twenty or thirty vigorous stems.

The culture of white clover, yellow clover, ribwort, and rye-grass, is the same in general with that of red clover. Yellow clover, ribwort, and rye-grass, are all early plants, blooming in the end of April or beginning of May. The two latter are evergreens, and therefore excellent for winter pasture. Rye-grass is less hurt by frost than any of the clovers, and will thrive in a moister soil: nor is it much affected by drought. In a rich soil it grows four feet high. These grasses are generally sown with red clover for producing a plentiful crop. The proportion of seed is arbitrary; and there is little danger of too much. When rye-grass is sown for procuring seed, five

firlots wheat measure may be sown on an acre; and, for procuring seed of rib-wort, forty pounds may be sown. The roots of rye-grass spread horizontally: they bind the soil by their number; and, though small, are yet so vigorous as to thrive in hard soil. Red clover has a large tap-root, which cannot penetrate any soil but what is open and free; and the largeness of the root makes the soil still more open and free. Rye-grass, once a great favorite, appears to be discarded in most parts of Britain. The common practice has been to sow it with red clover, and to cut them promiscuously in the beginning of June for green food, and a little later for hay. This indeed is the proper season for cutting red clover, because it then begins to flower; but, as the seed of the rye-grass is then approaching to maturity, its growth is stopped for that year, as much as of oats or barley cut after the seed is ripe. Oats or barley cut green before the seed forms, will afford two other cuttings; which is the case of rye-grass, of yellow clover, and of ribwort. By such management, all the profit will be drawn that these plants can afford.

When red clover is intended for seed, the ground ought to be cleared of weeds, as the seed cannot otherwise be preserved pure: what seeds escape the plough ought to be taken out by the hand. In England, when a crop of seed is intended, the clover is always first cut for hay. This practice will not answer in Scotland, as the seed would often be too late for ripening. It would do better to eat the clover by sheep till the middle of May, which would allow the seed to ripen. The seed is ripe when, upon rubbing it between the hands, it parts readily from the husk. Then apply the scythe, spread the crop thin, and turn it carefully. When perfectly dry, take the first hot day for threshing it on boards covered with a coarse sheet. Another way, less subject to risk, is to stack the dry hay, and to thresh it in the end of April. After the first threshing, expose the husks to the sun; and thresh them till no seed remain. Nothing is more efficacious than a hot day to make the husk part with its seed; in which view it may be exposed to the sun by parcels, in an hour or two before the flail is applied.

White clover, intended for seed, is managed in the same manner. No plant ought to be mixed with rye-grass that is intended for seed. In Scotland much rye-grass seed is hurt by transgressing that rule. The seed is ripe when it parts easily with the husk. The yellowness or the stem is another indication of its ripeness; in which particular it resembles oats, barley, and other culmiferous plants. The best manner to manage a crop of rye-grass, for seed, is to bind it loosely in small sheaves, widening them at the bottom to make them stand erect; as is done with oats in moist weather. In that state they may stand till sufficiently dry for threshing. They thus dry more quickly, and are less hurt by rain, than by close binding and putting the sheaves in shocks like corn. The worst way of all is to spread the rye-grass on the moist ground; for it makes the seed malten. The sheaves, when sufficiently dry, are carried in close carts to where they are to be threshed on a board, as mentioned above for

clover. Put the straw in a rick when 100 stone or so are threshed. Carry the threshing board to the place where another rick is intended; and so on till the whole seed is threshed, and the straw ricked. There is necessity for close carts to save the seed which is apt to drop out in a hot day; and a hot day ought always to be chosen for threshing. Carry the seed in sacks to the granary or barn, to be separated from the husks by a fanner. Spread the seed thin upon a timber floor, and turn it once or twice a-day till perfectly dry. If suffered to take a heat, it is useless for seed.

The writers on agriculture reckon sainfoin preferable to clover in many respects. they say that it produces a larger crop; that it does not hurt cattle when eaten green; that it makes better hay; that it continues four times longer in the ground; and that it will grow on land that will bear no other crop. Sainfoin has a very long tap-root, which is able to pierce very hard earth. The roots grow very large; and the larger they are, they penetrate to the greater depth; and hence this grass, when it thrives well, receives a great part of its nourishment from below the staple of the soil: of course, a deep dry soil is best for sainfoin. When plants draw their nourishment from that part of the soil that is near the surface, it is not of much consequence whether their number be great or small. But the case is very different when the plants receive their food, not only near, but also deep below the surface. Besides, plants that shoot their roots deep are often supplied with moisture, when those near the surface are parched with drought.

To render the plants of sainfoin vigorous, they must be sown thin. The best method of doing this is by a drill; because, when sown in this manner, not only the weeds, but also the super-numerary plants, can easily be removed. It is several years before sainfoin comes to its full strength; and the number of plants sufficient to stock a field, while in this imperfect state, will make but a poor crop for the first year or two. It is therefore necessary that it be sown in such a manner as to make it easy to take up plants in such numbers, and in such order, as always to leave in the field the proper number in their proper places. This can only be done with propriety by sowing the plants in rows by a drill. Supposing a field to be drilled in rows at ten inches distance, the partitions may be hand-hoed, and the rows dressed in such a manner as to leave a proper number of plants. In this situation the field may remain two years; then one-fourth of the rows may be taken out in pairs, in such a manner as to make the beds of fifty inches, with six rows in each, and intervals of thirty inches, which may be ploughed. Next year another fourth of the rows may be taken out in the same manner, so as to leave double rows, with partitions of ten inches, and intervals of thirty; all of which may be hoed at once or alternately, as may be most convenient.

The great quantity of this grass which the writers on this subject assure us may be raised upon an acre, and the excellency and great value of the hay made of it, should induce farmers to make a complete trial of it. The plants taken up from a field of sainfoin may be set in another

field; and if the transplanting of the grass succeeds as well as the transplanting of lucerne has done with Mr. Lumin de Chateauvieux, the trouble and expense will be sufficiently recompensed by the largeness of the crops. In transplanting, it is necessary to cut off great part of the long tap-root: this will prevent it from striking very deep into the soil, and make it push out large roots in a sloping direction from the cut end of the tap-root. Sainfoin managed in this manner will thrive even on shallow land that has a wet bottom, provided it be not overstocked with plants. Whoever inclines to try the culture of this grass in Scotland, should take great pains in preparing the land, and making it as free from weeds as possible. In England, as the roots strike deep in that chalky soil, this plant is not liable to be so much injured by drought as other grasses are, whose fibres lie horizontally, and lie near the surface. The quantity of hay produced is greater and better in quality than any other. But there is one advantage attending this grass, which renders it superior to any other; viz, that it affords excellent feeding for milch cows. The prodigious increase of milk which it makes is astonishing, being nearly double that produced by any other green food. The milk is also better, and yields more cream than any other; and the butter procured from it is much better colored and flavored.

The following remarks by an English farmer are made from much experience and observation. Sainfoin is much cultivated in those parts where the soil is of a chalky kind. It will always succeed well where the roots run deep; the worst soil of all for it is where there is a bed of cold wet clay, which the tender fibres cannot penetrate. It will make a greater increase of produce, by at least thirty times, than common grass or turf on poor land. Where it meets with chalk or stone, it will extend its roots through the cracks and chinks to a very great depth, in search of nourishment. The dryness is of more consequence than the richness of land for sainfoin; although land that is both dry and rich will always produce the largest crops. It is very commonly sown broad-cast; but it answers best in drills, especially if the land be made fine by repeated ploughing, rolling, and harrowing. Much depends on the depth which this seed is sown. If it be buried more than an inch deep, it will seldom grow; and, if left uncovered, it will push out its roots above ground, and these will be killed by the air. March and the beginning of April are the best seasons for sowing it, as the severity of winter and the drought of summer are equally unfavorable to the young plants. A bushel of seed sown broad-cast, or half that quantity in drills, if good, is sufficient for an acre. The drill should be thirty inches apart, to admit of horse-hoeing between them. Much depends on the goodness of the seed, which may however, be best judged of by the following marks:—

The husk being of a bright color, the kernel plump, of a gray or bluish color without, and, if cut across, greenish and fresh within; if it be thin and furrowed, and of a yellowish cast, it will seldom grow. When the plants stand single, and have room to spread, they produce the

greatest quantity of herbage, and the seed ripens best. But farmers in general plant them so close that they choke and impoverish each other, and often die in a few years. Single plants run deepest and draw most nourishment; they are also easiest kept free from weeds. A single plant will often produce half a pound of hay, when dry. On rich land this plant will yield two good crops in a year, with a moderate share of culture. A good crop must not be expected the first year; but, if the plants stand not too thick, they will increase in size the second year prodigiously. No cattle should be turned on the field the first winter after the corn is off with which it was sown, as their feet would injure the young plants. Sheep should not come on the following summer, because they would bite off the crown of the plants, and prevent their shooting again. A small quantity of soapers' ashes as a top-dressing will be of great service, if laid on the first winter.

If the sainfoin be cut just before it comes into bloom, it is admirable food for horned cattle; and, if cut thus early, it will yield a second crop the same season. But, if it proves a wet season, it is better to let it stand till its bloom be perfected; for great care must be taken, in making it into hay, that the flowers do not drop off, as cows are very fond of them; and it requires more time than other hay in drying. Sainfoin is so excellent a fodder for horses, that they require no oats while they eat it, although they be worked hard all the time. Sheep will also be fattened with it faster than with any other food. If the whole season for cutting proves very rainy, it is better to let the crop stand for seed, as that will amply repay the loss of the hay; because it will not only fetch a good price, but a peck of it will go as far as a peck and a half of oats for horses. The best time of cutting the seeded sainfoin is when the greatest part of this seed is well filled, the first blowing ripe, and the last blowing beginning to open. For want of this care some people have lost most of their seed by letting it stand too ripe. Seeded sainfoin should always be cut in a morning or evening, when the dews render the stalks tender. If cut when the sun shines hot, much of the seed will fall out and be lost.

An acre of very ordinary land, when improved by this grass, will maintain four cows very well from the 1st of April to the end of November; and afford, besides, a sufficient store of hay to make the greater part of their food the four months following. If the soil be tolerably good, a field of sainfoin will last from fifteen to twenty years in prime; but, at the end of seven or eight years, it will be necessary to lay on a moderate coat of well rotted dung; or, if the soil be very light and sandy, of marle. The future crops, and the duration of the plants in health and vigor, will thus be greatly increased and prolonged. Hence it will appear that, for poor land, there is nothing equal to this grass in point of advantage to the farmer. Clover will last only two years in perfection; and often, if the soil be cold and moist, nearly half the plants will rot, and bald patches be found in every part of the field the second year. Besides, from our frequent rains

during September, many crops left for feeding are lost. But from the quantity and excellent quality of sainfoin, and its ripening earlier, and continuing in vigor so much longer, much risk and expense is avoided, and a large annual profit accrues to the farmer.

The writers on agriculture, ancient as well as modern, bestow the highest encomiums upon lucerne as affording excellent hay, and producing very large crops. Lucerne remains at least ten or twelve years in the ground, and produces about eight tons of hay upon the Scots acre. There is but little of it cultivated in Scotland. However, it has been tried in several parts of that country; and it is found that, when the seed is good, it comes up very well, and stands the winter frost. But the chief thing which prevents this grass from being more used in Scotland is the difficulty of keeping the soil open and free from weeds. In a few years the surface becomes so hard, and the turf so strong, that it destroys the lucerne before the plants have arrived at their greatest perfection; so that lucerne can scarcely be cultivated with success there, unless some method be fallen upon of destroying the natural grass, and preventing the surface from becoming hard and impenetrable. This cannot be done effectually by any other means than horse-hoeing. This method was first proposed by Tull, and afterwards practised successfully by M. de Chateauvieux. That gentleman tried the sowing of lucerne both in rows upon the beds where it was intended to stand, and likewise the sowing it in a nursery, and afterwards transplanting it into the beds prepared for it. He prefers transplanting; because part of the tap-root is thus cut off, and the plant shoots out a number of lateral branches from the cut part of the root, which makes it spread its roots nearer the surface, and consequently renders it more easily cultivated; besides, this circumstance adapts it to a shallow soil, in which, if left in its natural state, it would not grow. This transplanting is attended with many advantages. The land may be prepared in summer for receiving the plants from the nursery in autumn; by which means the field must be in a much better situation than if the seed had been sown upon it in the spring. By transplanting, the rows can be made more regular, and the intended distances more exactly observed; and consequently the hoeing can be performed more perfectly, and with less expense. M. Chateauvieux likewise tried the lucerne in single beds three feet wide, with single rows; in beds three feet nine inches wide, with double rows; and in beds four feet three inches wide, with triple rows. The plants in the single rows were six inches asunder, and those in the double and triple rows were about eight or nine inches. In a course of three years he found that a single row produced more than a triple row of the same length. The plants of lucerne, when cultivated by transplantation, should be at least six inches asunder, to allow them room for extending their crowns.

He further observes that the beds or ridges ought to be raised in the middle; that a small trench, two or three inches deep, should be drawn in the middle; and that the plants ought to be set in this trench, covered with earth up to the

neck. He says that if the lucerne be sown in spring, and in a warm soil, it will be ready for transplanting in September; that, if the weather be too hot and dry, the transplanting should be delayed till October; and that, if the weather be unfavorable during both these months, this operation must be delayed till spring. He further directs that the plants should be carefully taken out of the nursery, so as not to damage the roots; that the roots be left only about six or seven inches long; that the green crops be cut off within about two inches of the crown; that they be put into water as soon as taken up, and remain till they are planted; and that they should be planted with a planting-stick, in the same manner as cabbages. He does not give particular directions as to the times of horse-hoeing; but only says, in general, that the intervals should be stirred once in the month during the whole time that the lucerne is in a growing state. He likewise observes that great care ought to be taken not to suffer any weeds to grow among the plants, at least for the first two or three years; and, for this purpose, that the rows, as well as the edges of the intervals where the plough cannot go, should be weeded by the hand.

Burnet is peculiarly adapted to poor land, it proves an excellent winter pasture when hardly any thing else vegetates. It makes good butter; it never swells cattle; it is fine pasture for sheep; and will flourish well on poor, light, sandy, or stony soils, or even on dry chalk hills. The cultivation of it is neither hazardous nor expensive. If the land is prepared as is generally done for turnips, there is no danger of its failing. After the first year, it will be attended with very little expense, as the flat circular spread of its leaves will keep down, or prevent the growth of weeds. On the failure of turnips, either from the fly or black worm, some of our farmers have sown the land with burnet, and in March following had a fine pasture for their sheep and lambs. It will perfect its seed twice in a summer; and this seed is said to be as good as oats for horses; but it is too valuable to be applied to that use. It is sometimes sown late in the spring, with oats and barley, and succeeds very well; but it is best to sow it singly in the beginning of July, when there is a prospect of rain, on a small piece of land, and in October following transplant it in rows two feet apart, and about a foot distant in rows. This is a proper distance, and gives opportunity for hoeing the intervals in the succeeding spring and summer. After it is eaten down by cattle, it should be harrowed clean. Some horses will not eat it freely at first, but in two or three days they are generally very fond of it. It affords rich pleasant milk, and in great plenty. The severest frost never injures it, and the oftener it is fed upon, the thicker are its leaves, which spring constantly from its root.

PART II.

OF THE GRAZING SYSTEM.

Grazing, in a large sense, will comprehend the entire management of grass lands. These are obviously divided into *meadows*, or such perennial grass lands as are usually kept for a hay crop, and permanent *pastures*. The importance of

some system for their proper management being adopted will appear from the consideration that by far the greater part of the land of Great Britain is included in one or other of these descriptions. See MEADOW.

Of the culture of meadows.—The most luxuriant and valuable meadows are found in the bottom of valleys, and connected with one or more rivers of the neighbourhood: often indeed the entire growing soil has been washed down from adjoining highlands. This, of all other land, observe the Agricultural Reports of Staffordshire, is 'the most productive of grass and hay, yielding sustenance for cattle through the summer and the winter, and producing an everlasting source of manure for the improvement of the adjoining lands. In all cases of extensive enclosures, the improvement of the vale land, or that formed by nature for meadow and pasture, should be first attended to. In this view, the low lands in all situations come under the head of natural meadows. But river or *low* meadows, from their long retention of moisture, and the great depth of vegetable matter which they contain, are certainly liable to throw up coarse herbage; in many cases therefore more careful drainage, as well as other management, is necessary to bring them into proper condition for the growth of good herbage than is requisite in the hay grounds in more elevated places. The most proper season for surface-draining grass lands is autumn, when they are comparatively firm and dry; in the early spring months such lands are too full of moisture. The grips, or small open drains, should be cut obliquely in the most suitable directions for conveying off the superficial stagnant water. 'It is a practice, in some cases, to suffer the sods or grippings that are taken out of the trenches to remain on their sides; but it is much better, and a less slovenly mode, to have them conveyed from the land and laid up in heaps, in order to their being acted upon by the winter frosts and other causes, so as to be brought into a state proper for being formed into composts with well rotted farm-yard dung. Much of this sort of draining may be performed at a small expense, and the beneficial effects be very considerable, especially where the lands are very much loaded with moisture, in the quantity of produce.' Besides, such meadow lands 'demand much more attention in their management in other respects, as those of their being fed by cattle, and the performing of the different operations that are proper for rendering them productive of good herbage. In these cases stock should be turned upon the lands, and manures be applied with much care, and only when the land is in such a state of dryness as not to be injured by the poaching or breaking of the sward. The higher sorts of grass lands, in most instances, admit of considerably more latitude in performing these different operations, as they are capable of admitting the stock, as well as the dung-cart, more early in the spring months, and of suffering them to remain or be applied at later periods in the autumn without inconvenience. The advantage of this attention is rendered sufficiently plain by the effects which the contrary practice produces in such meadow and other hay lands as are in a state of commonage, where the stock

is admitted at all seasons, and under all circumstances.'

'In a piece of clayey meadow land,' mentioned in the Agricultural Report of Middlesex, 'which was exposed to the treading of cattle during the wet season of winter, with a view of fully ascertaining the effects of the practice of suffering cattle to remain too long upon grass hay lands, it was found that after three years, notwithstanding every possible care and attention in rolling, manuring, and sowing grass seeds, was employed, it was not restored to its former state of sward.' And it is said that, on the deep tough yellow clayey grass lands in this district, 'it is well known that wherever a bullock makes a hole with his foot, it holds water, and totally destroys every vestige of herbage; which is not quite replaced till several years after the hole is grown up.' Bog-meadows are drained and managed in a similar manner with other low meadows.

The upland meadows of Middlesex yield also some fine hay crops; being so well situated for receiving the manure of the metropolis. Here moss, mole-hills, and ant-hills, are the great enemies of the farmer: and the destruction of the latter is often a process of no small difficulty. It is said that where grass lands are sufficiently rolled with a heavy roller, once or oftener every year, no ant-hills will ever be formed greater than the roller can compress, and consequently no injury will be sustained. In this, as in most other cases of disease, observes Mr. Loudon, proper regimen is the best cure. 'In domestic economy, various directions are given for destroying bugs, lice, and other vermin; but who ever had any to destroy, who attended properly to cleanliness?'

With regard to the application of manure, we are told in the Middlesex Report, that almost all the grass lands in the county are preserved for hay, that the manure is invariably laid on in October, while the land is sufficiently dry to bear the driving of loaded carts without injury, and when the heat of the day is so moderated as not to exhale the volatile parts of the dung. Other agriculturists prefer applying it immediately after hay-time, or from about the middle of July to the end of August, said to be the 'good old time' (*Commun. to Board of Agriculture*, vol. iv. p. 138); others again from the beginning of February to the beginning of April (*Dickson's Practical Agriculture*, vol. ii. p. 915).

'The dairy farmers in North Wiltshire,' observes Mr. Davies, and in particular the graziers, are much more attentive to the quality than the quantity of their hay. They make a point of haining up their meadows as early as possible in autumn, and of course are able to mow early in the summer. It is not uncommon to see grass mown, not only before it is in blossom, but even before it is all in ear; and to this it is owing that it is more common to fat cattle with hay alone, in North Wilts, than perhaps in any country in the kingdom. And by this the dairy-men are able to keep up the milk of those cows that calve early, and from which calves are fatted, which otherwise shrink before the springing of the grass and never recover. And the advantage they get by early after-grass, and by the duration

of that after-grass to a late period in autumn, fully compensates for the loss of quantity in their hay crop.'

Dr. Anderson says it is in general understood that, if hay can be made so as to retain some tinge of its green color, it is better than if it were bleached white or rotted; but precautions are seldom thought necessary to be adopted for guarding against the effects of scorching sunshine, which, by too quickly exhaling its natural juices, renders it sticky, brittle, and unpalatable to a certain degree; and, what is of still more importance, the effects of rain, or even dew if abundant, if they are suffered to fall upon the grass after it is cut, and before it be made into hay, are seldom adverted to; so that if dry weather comes soon to exhale that wet, while the grass lies spread out upon the ground, the farmer feels little anxiety about the consequences; though it is a certain fact that no hay which has been in the least wetted during the process of hay-making can ever be made to have that sweet palatable taste it would have had without it. Nor has our author ever seen that beasts, when allowed to choose between hay so made and that which has been guarded from moisture, ever hesitated to make choice of the last, or committed a mistake, even where he himself could not distinguish a perceptible difference. But to obtain hay in all cases of the very best quality the circumstances will admit of, the following process, he says, may be safely conjoined with the practice of cutting and feeding beasts with grass in the house as above recommended. Where the produce of grass land is to be cut, as above described, and used green, it will be proper in general to reserve a part of it for hay. In this case the cutting for grass and for hay should be carried on together, but with the following variations, depending on the uses it is to be applied to. That part of the grass which is intended to be used green, as it will suffer no damage by being cut when wet, must continue to be cut regularly each day as it is wanted, without regard to the weather; whereas that part of it which is intended for hay ought on no account to be cut while wet; and, therefore, that part of the operation must be discontinued, unless when the weather is dry and fine; nor should it ever be cut either in the morning or the evening, while dew is upon it. And as the hay, in the mode proposed, ought to be made day by day, for a continuance, as the grass comes forward for the scythe, while the weather is in a proper state for it, and not all at one time, as in the usual mode of hay-making, the cutting both grass and hay from the same field may be very economically combined together. For this purpose the grass which is cut in the morning, while the dew may perhaps be upon it, and in the afternoon, ought to be appropriated to the beasts green; and that part of the grass only which is cut from nine till two o'clock, while the weather is dry and fine, should be made into hay. If the mower begins to cut down for hay about nine o'clock in the morning, and goes on in that operation till one or two in the afternoon; and, if the persons who are to put up the hay begin that operation about one, the grass will

thus be allowed to lie between three and four hours in the swathe, exposed to the sun, which will exhale some part of its moisture, and deaden it enough for the purposes required, though it still retains the whole of its nutritious juices without abatement. After being allowed to lie thus long it should be raked clean up, and carried off the field in the same cart that is employed for taking in the grass, and immediately put into the stack, so as that the whole grass that was cut that day shall be put up before evening; and thus regularly each good day throughout the season. But as grass, while in this green and succulent state, would not keep if put up by itself, care must be taken to provide some dry forage to mix with it. For this purpose nothing can be so proper as good dry hay; but, for want of that, at the beginning, good straw may be very safely employed. Our author once saved a great quantity of clover hay, being a late third cutting, when the season was too far advanced to admit of its being made in the usual way, by putting it up when new cut, thus intermixed with a large proportion of good straw. It kept perfectly well; and, when cut down and given to the beasts, was relished by them better than any other hay he had, and was equally valuable for every purpose.

Every part of the management in Middlesex, with regard to hay, has been acknowledged by able judges to be very superior. When the grass here is nearly fit for mowing, the farmer generally lets it out to be mown by the acre; calculating that a healthy man will mow from one and a-half to two acres a day, beginning very early in the morning. He provides five hay-makers to each mower, and they are expected to bring a fork and rake of their own. The course of operations that now takes place is thus described in the Middlesex Report:—

First day.—All the grass mown before nine o'clock in the morning is tedded, in which great care is taken thoroughly to loosen every lump, and to strew it evenly over all the ground. By this regular method of tedding grass for hay, the hay will be of a more valuable quality, heat more equally in the stack, consequently not so liable to damage or fire; will be of greater quantity when cut into trusses, and will sell at a better price; for, when the grass is suffered to lie a day or two before it is tedded out of the swathe, the upper surface is dried by the sun and winds, and the interior part is not dried, but withered, so that the herbs lose much, both as to quality and quantity, which are very material circumstances. Soon after the tedding is finished, the hay is turned with the same degree of care and attention: and if, from the number of hands, they are able to turn the whole again, they do so, or at least as much of it as they can, till twelve or one o'clock, at which time they dine. The first thing to be done after dinner is to rake it into what are called single wind-rows; and the last operation of this day is to put it into grass-cocks.

Second day.—The business of this day commences with tedding all the grass that was mown the first day after nine o'clock, and all that was mown this day before nine o'clock. Next, the

grass-cocks are to be well shaken out into staddles (or separate plats) of five or six yards diameter. If the crop should be so thin and light as to leave the spaces between these staddles rather large, such spaces must be immediately raked clean, and the rakings mixed with the other hay, in order to its all drying of a uniform color. The next business is to turn the staddles, and after that to turn the grass that was tedded in the first part of the morning, once or twice, in the manner described for the first day. This should all be done before twelve or one o'clock, so that the whole may lie to dry while the work-people are at dinner. After dinner the first thing to be done is to rake the staddles into double wind-rows; next, to rake the grass into single wind-rows; then the double wind-rows are put into bastard-cocks; and, lastly, the wind-rows are put into grass-cocks. This completes the work of the second day.

Third day.—The grass mown and not spread on the second day, and also that mown in the early part of this day, is first to be tedded in the morning, and then the grass-cocks are to be spread into staddles as before, and the bastard-cocks into staddles of less extent. These lesser staddles, though last spread, are first turned, then those which were in grass-cocks; and next the grass is turned once or twice before twelve or one o'clock, when the people go to dinner as usual. If the weather has proved sunny and fine, the hay which was last night in bastard-cocks will this afternoon be in a proper state to be carried; but if the weather should, on the contrary, have been cool and cloudy, no part of it probably will be fit to carry. In that case the first thing set about after dinner is to rake that which was in grass-cocks last night into double wind-rows; then the grass which was this morning spread from the swathes into single wind-rows. After this the hay which was last night in bastard-cocks is made up into full-sized cocks, and care taken to rake the hay up clean, and also to put the rakings upon the top of each cock. Next, the double wind-rows are put into bastard-cocks, and the single wind-rows into grass-cocks, as on the preceding days.

Fourth day.—On this day the great cocks just mentioned are usually carried before dinner. The other operations of the day are such, and in the same order, as before described, and are continued daily until the hay harvest is completed.

Of the culture of pastures.—Dr. Anderson, in the third volume of his *Essays on Agriculture*, has some practical remarks on pastures, which we think worth perpetuating in our work:—‘It is stated,’ he says, ‘in the *Agricultural Survey of Gloucestershire*, that one acre of rye-grass, which had been saved from Michaelmas to May, kept nine ewes and lambs one month. We may, therefore, he adds, conclude that the produce of the same field, from May till Michaelmas, would have been double to that it yielded during the winter half year; consequently it could have sustained eighteen ewes and lambs one month. At this rate the acre of ground, taking the whole year round, would have afforded food for twenty-seven ewes and lambs for one month. These were large

sheep, weighing about twenty-five pounds per quarter on the average. In the Survey of Wiltshire, it is said that 500 such ewes and lambs are sufficient to dung an acre each day when folded upon it; at that rate, says the Dr., twenty-seven of them should dung an acre in a little less than nineteen days; consequently, in thirty days, somewhat better than half an acre more. He is, however, inclined to think this would be but a very moderate dunging; but should double the quantity of dung, or more, be required for certain purposes on particular occasions, it will not, he says, affect the conclusions deducible from these facts in kind, only in degree. Hence, in his opinion, it follows, that if none of this dung were suffered to go to waste, an acre of good land laid down to grass, in high order, should afford as much dung as would be sufficient to dress each year an acre and a half of other land.

In the Agricultural account of Suffolk, it is stated that the rich marsh lands there keep at the rate of six sheep for seven summer months, and four for the five winter months per acre; that is, a little more than five sheep on an average per acre throughout the year. These are very large sheep, of which 800 would be equal to the 500 ewes and lambs above mentioned, and consequently would be sufficient to dung an acre in one day. But five times 365 makes 1825, the number of sheep kept for one day. At this rate one acre of these rich grass lands would afford as much dung in the course of one year, as should be sufficient to dung somewhat more than two acres and a quarter each year, if husbanded with due economy and attention.

But, as the sheep in neither of these cases are folded, the dung is suffered to drop in a scattered manner over the pastures, throughout the whole year. In this manner the influence of the dung must either be nothing, or it must produce certain effects upon the grass. It is well known that when sheep are folded upon grass ground, so as to deposit their dung upon it in considerable quantities all about one time, as in folding, the effect is, that a flush of grass is quickly produced over its whole surface, which is much more luxuriant and abundant than it would have been, had it not received this dressing. But it is well known, that the animals, whose dung has occasioned that flush of grass, nauseate it; nor can they be brought to taste it, unless they be compelled through hunger; although animals of another kind are seen to eat that kind of grass, not only without reluctance, but even with avidity. He thinks the extra flush of grass raised on the two acres and a half, that might be thus manured by the sheep fed on one acre, would be sufficient, on a moderate computation, to keep at the rate of two sheep per acre. By consequence, the extra grass produced by the dung of the sheep kept on one acre of this rich grass land, would be sufficient to keep four sheep and a half. But, to keep within bounds, say three sheep only could be kept by the grass produced from the dung of the sheep fed on one acre. If the dung be supposed to have the same effect in producing extra grass, when dropped from the animals as they pasture on the field, as it has when laid upon ground closely by means of folding,

it must follow, from these premises, that as much grass will grow from the dung upon each acre as would feed three sheep. But, as the sheep will not eat this kind of grass without constraint, the ground must either be so hard stocked as to compel them, through hunger, to eat that nauseous food, or that portion of the grass produced by the dung will be suffered to run to waste; so that, in either case, a considerable loss must be sustained by the owner. After some farther remarks our author adds, 'If these observations be well founded, what an amazing waste is sustained through the nation, by the loss of the dung thus uselessly scattered on the surface of pasture fields!'

The remedy which first presents itself in this case, he contends, is that of folding; and that, if properly managed, there are perhaps few cases in which it might not be put in practice, not only without detriment to the stock, but even to their advantage. All animals, but especially those that ruminate, choosing to feed and rest by turns. Ruminating animals require much time for rest; and, the more quiet they are allowed to be during that period, the better they will thrive. If these then are withdrawn from their pastures after they have properly filled their bellies, and when they become necessarily disposed to ruminate, they can sustain no damage by being put into a place where they can have no access to food. And if they be only as long detained there as till they have rechewed the food they have swallowed, and begin to feel an inclination to eat more, they will be benefited by this confinement, rather than otherwise. And they will thus all feed and rest at the same time.

Penning, however, under injudicious management, may tend to retard the feeding of the animals subjected to it. If the creatures be driven to a great distance from their pastures to the pen, it must subject them to a hurtful degree of fatigue; and this will be increased if they are made to pass through lanes, where they may be crowded by passengers, mired in dirt, or drenched in wet; or if they are neglected too long in the pen; or put up at improper times, &c. Therefore, to derive the full benefit from folding, where the pastures are of a great extent, there ought to be two or more folds placed close by the pasture, at convenient distances; so that the flocks, being gently conducted from one to the other, feeding all the way, might find themselves, when full, just at the place for rest. There they should be suffered to remain just so long as is found to be necessary to complete their ruminating process, and to prepare them for feeding afresh; they should then be suffered to rise and stretch themselves, when they naturally void their dung and urine on the spot. Thus will the dung be preserved, and the pastures be kept clean and sweet. They ought then to be led gently to the fresh pasture which they had not lately breathed upon, or trampled with their feet, and which of course will be to them sweet and inviting; they should thus be slowly conducted to their next resting place, feeding all the way; and so on till they go over the whole in a regular succession. If diseases be produced by suffering the animals to eat their food when covered with hoar frost, or dew, or mildew, or

at certain times of the day or night, when snails and other creatures are abroad, which they may swallow with their food, in all these cases, when observed, the evil may, by an attentive economist, be avoided by a judicious use of the fold. He may also withdraw the sheep from the pastures when they become restless and refuse to feed. In short, a judicious economist, by having folds properly situated, respecting the circumstances of shelter, coolness, water, and other conveniences, may avail himself of these for greatly promoting the health and enjoyment of the animals, and thus accelerating their feeding; so that, independent of the benefits he shall derive from their dung, he will in other respects reap considerable emolument.

Dr. Anderson observes that some persons contend that the pastures ought to be stocked very lightly; alleging that although much of the produce is thus allowed to run to seed, which the beasts will not eat, and which of course is trod under foot, and rotted by rain, and thus wasted; yet experience, they say, proves that a greater profit will be thus derived from it, upon the whole, on account of the superior thriving of the animals, than by any other practice. Others insist that lightstocking of grass land is a practice highly to be condemned; as it tends not only gradually to diminish its produce, but also to encourage the growth of coarse and unprofitable grasses, which deteriorate the pastures; and that hard stocking of grass lands, especially those of a rich quality, is an indispensable requisite of good management. These two opinions, so diametrically opposite, and which are equally maintained by sensible men, he thinks, clearly prove the embarrassment to which they are subjected, in consequence of their not having adverted to the circumstances stated above, and many other particulars, as affecting the economical consumption of the produce of lands in grass. A third party, he adds, who approach perhaps nearer to the truth than either, advise that a mixed stock should be always kept upon the same field; and that, were the consumption of the foul grass produced by the dung of the animals the only article to be adverted to, it might doubtless be so managed as to correct this evil. But there are so many circumstances to be adverted to, that it is not easy by these means to get them all remedied. In every field a variety of plants spontaneously spring up, some of which are disrelished by one class of animals, while they are eaten by others; and some of which, though eaten readily by some animals at one particular period of their growth, are rejected by them entirely at another. Thus it becomes necessary, not only to have a vast variety of animals in the same pasture, but also a very particular attention is required to augment or diminish the proportion of some of these classes of animals, at particular seasons of the year; otherwise some part of the produce will be allowed to run to waste, unless it be hard stocked to such a degree as to retard their thriving. But, if a great variety of animals be allowed to go at large in the same pasture, they are never suffered to feed with that tranquillity which is necessary to ensure thriving in the highest degree. One class of these wishes to feed, or to play,

while the others would incline to rest. They thus mutually disturb and tease each other; and this inconvenience is greatly augmented if penning of any sort be attempted. From these considerations the practice of intermixing various kinds of stock very much together is productive of evils in many cases greater than those which result from the waste of food they were intended to prevent. And though, by hard stocking, the grass will be kept shorter, and more palatable in general to the animals who eat it, than if it were allowed to run to a great length, yet as animals which are to be fatted must not only have sweet food, but an abundant bite at all times, to bring them forward in a kindly manner, it seems to be nearly impossible to obtain at the same time both these advantages in the practice of pasturage.

Might not these evils, says our author, be greatly diminished, if not entirely remedied, in many cases, by having the produce cut by the scythe, and given to the animals fresh in the house; rather than to suffer them to go at large and eat the produce on the field, even under any system of management whatever? Many arguments, he thinks, tend to show that this practice is, in general, highly economical and advantageous. 1. If the consumption of plants be the object principally attended to, it is plain the benefits will be great; for experience has clearly proved that there are many plants which are greedily consumed by beasts, if cut and given to them in the house, which never would be touched by them when growing in the field. Of this nature is the dock, cow-parsley, thistles, nettles, and many other plants. Upon what principle it should happen that these plants should be so readily eaten when thus given, while they are totally rejected when in the field, he cannot say; but that they are thus eaten, without reluctance, even when the animal is not hurtfully hungry, is evident from this circumstance, that the beasts often fall greedily to these at the moment they are brought in from the field, even before they have had time to become hungry after they had come in. Fewer plants would be rejected or suffered to go to waste on this plan. 2dly. Many of even the best kinds of grasses, which when young form the most palatable food for the creatures, if once suffered to get into ear; are disrelished so much as never to be tasted by them unless to prevent starvation; and as, in most pasture fields, many of these grasses get into ear from various causes, all the produce of these plants is inevitably lost to the farmer. But if cut down by the scythe, in proper time, not one of these is ever suffered to get into that nauseating state; and consequently no waste is sustained. 3dly. But when animals are suffered to go upon the field, many of the plants are trodden under foot by the beasts, and bruised or buried in part of the earth; in which state they are greatly disrelished by them, and are suffered to run to waste; which never would take place were the practice of cutting adopted generally. Lastly. Those few plants which are totally distasteful by one class of animals, will not, from this circumstance, become less acceptable to others, but much the reverse. Food that an animal has breathed upon, for any considerable time, be-

comes unpleasant to other animals of the same class; but not so to those of another species; it seems indeed thus to acquire for them a higher relish. Even greater defilement by one animal seems to render food more acceptable to others; for straw, that in its clean state has been rejected by cattle, if employed as litter for horses, acquires a relish for cattle that they search for with avidity. Hence the sweeping of the stalls from one animal furnishes a dainty repast for those of another kind; which can easily be shifted from one to the other, if the plants are consumed in the house, but which must have been lost in the field.

If, adds this author, the health and the comfort of the animal be chiefly adverted to, the balance will be clearly in favor of the cutting system, when compared with that of pasturing. When animals are exposed to the sun, in the open air, they are not only greatly incommoded on many occasions by the heat, but also are annoyed by swarms of flies, gnats, and hornets, particularly by the gad-fly, which drives them into a state of fury, and must retard their thriving. At other times they are hurt by chilling blasts, or drenched by cheerless rain, which renders their situation very unpleasant, and greatly retards their feeding. Under proper management, in a well constructed stall, all these evils would be removed, and they would be kept perpetually in a proper state of coolness, tranquillity, and ease, so as to make the same quantity of food go farther than it otherwise could have done in nourishing them. They would also be prevented from licking up snails, worms, and other noxious creatures, among their food, which they are by pasturing apt to do, when they feed at those times of the day or night when those creatures crawl abroad. This would be entirely avoided by cutting the grass at those times of the day when none of these are to be found. Thus lingering diseases might often be avoided, which always retard the thriving, and often prove the destruction of the animal. And by giving an opportunity of administering dry and nourishing food along with the soft and succulent, and by varying the tastes, so as to provoke an appetite, not only the health, but the thriving of the creatures, would be greatly augmented beyond what they could have been in any other way.

But, if manure is to be chiefly attended to, there can be no comparison between the two modes of consumption. This is so greatly in favor of stall-feeding, that it would be idle to spend time in proofs of a proposition that may be considered as self-evident and certain. And lastly, if the quantity of *herbage* produced from the same field be adverted to, it will be found to be equally in favor of the cutting system. All animals delight more to feed on the young fresh shoots of grass, than those that are older. Hence those patches in a pasture field that happen to have been eaten once bare, in the beginning of the season, are kept very short ever afterwards throughout the whole of that season, by the creatures delighting to feed upon them in preference to the parts of the field that have got up to a greater head; so that these last are suffered to remain in a great measure untouched throughout the season. It is not, however, in general

known, that grass, even the leafy parts of it, when it has attained a certain length, becomes stationary; and, though it will retain its verdure for some months in that state, makes no sort of progress whatever; whereas, if it had been cropped down frequently, it would have continued in a constant state of progress, advancing with a rapidity in a great measure proportioned to the frequency of its being cropped. For experimental proofs of this fact, see our author's Essay on Agriculture and Rural Affairs, Vol. II. Disquis. V.

'I have often,' says he, 'seen lawns around gentlemen's houses that have been under a course of continued shaving from time immemorial, that discovered no symptoms of exhaustion, nor any sensible diminution of luxuriance or verdure, though no manures of any sort had ever been laid upon them. This fact struck him as important; and he applied for information respecting this particular, to a gardener who had the charge of very extensive lawns of this sort, belonging to a gentleman of large property. He assured him that, for upwards of thirty years that he had had the care of the lawns, some parts of them which had been laid down long before he knew them, and were originally, as he supposed, of a rich quality, had never received during all that time the smallest quantity of manure of any sort; and that the lawn continued to be equally close in the pile, equally verdant at all seasons in the year, and required to be as often cut as ever; and that, in short, he had no reason to apprehend that the quantity of its produce had diminished in the smallest degree.' This seems to our author a strong presumptive proof that grass land, when once of a rich quality, may be continued for an indefinite length of time under the scythe, without being at all deteriorated, even when it gets no return of dung. And as the Doctor has shown that rich grass land, under pasturage, produces as much dung as ought to manure each year more than double its own extent of surface; it follows that, if the same quantity of grass land will only furnish as many beasts in the house, as if it were pastured upon (and it will do much more), there can be annually obtained from each acre of land kept under the scythe as much dung as might manure two acres more, which might be abstracted from that grass land without deteriorating it. Of course, if the land be such as that it can admit of being made richer, a dressing of that dung, now and then returned upon itself, would give it the richness wanted, without any extraneous aid. In this point of view, then, it seems to be impossible to deny that rich land, if kept under the scythe, can never become poorer, if none of the dung made by the beasts fed upon it be abstracted from it; but that, on the contrary, it can thus be made to afford a large annual supply of dung for the purpose of enriching poorer land, while it still continues to be fertile itself in the same degree. He also remarks, there seems to be no doubt but that the quality of the grass must continue to improve while under the scythe, much more than while under pasturage. Every person, says he, who has bestowed the smallest attention to objects of this sort, must have re-

marked that the worst kind of grasses grow most freely upon those parts of rich grass lands that are the most open and spongy in their texture; and that they are in general much sweetened in the pile where they chance to be much trod upon. Hence the finest grasses on such fields always abound most upon paths which are moderately trod upon; white clover, and the sweetest grasses, being seen there in abundance, while they are less frequent in the spongy parts of the field. But frequent rolling tends to produce this effect more universally and equally than any kind of treading by beasts.

In confirmation of this, the observations of Mr. Davies, in his Account of the Agriculture of Wiltshire, may be quoted. He says that 'the sweetness of the feed depends much more on its being kept close, and eaten as fast as it shoots, than on any peculiar good quality of the grass itself; for there are many downs that, when close fed, appear to be a very sweet pasture, but which, if suffered to run a year or two without a full stock on them, will become so coarse that sheep will almost as soon starve as eat the grass: and even in those parts of the downs, where the finer and sweeter grasses abound, the soil is frequently so loose and porous, that nothing but constant treading will prevent them from dying out, or being choked by the larger and coarser grasses.' It is farther remarked, by Mr. Davies, that in consequence of too light stocking, heath, in some cases, comes in the place of the better grasses. But, says Dr. Anderson, it is very evident that all the purposes of hard stocking, that is, keeping the grass short, and in a continual state of vegetation, and consequently sweet, and preventing the coarser grasses from running up to stalk and overpowering the others, together with the consolidating of the ground by treading, would be obtained with much greater certainty by the practice of mowing; while the animals that consumed the produce could in no case be subjected to a stint of food, which they necessarily must sometimes be, where reliance is had upon hard stocking for preventing this evil.

Our able essayist observes that the terms sweetness of pasture, and sweet kinds of grass, frequently occur in agricultural writings; yet it is doubtful, if ever they have been properly defined. He therefore here attempts to supply this defect. Those pastures which animals choose to feed upon in preference to others, and which in general are eaten down close to the ground, are said to be sweet pastures, he observes, in contradistinction to those where the grass, being disrelished, is suffered to grow to a greater length, and often to wither in part, without being touched; which are called coarse, or, if tending to dampness, sour pasture. Without entering into a disquisition concerning the circumstances that tend to produce this sweetness, which are various, he considers that, from whatever cause it originates, it is a universal rule, that in every case the younger the grass is, the sweeter and more palatable it will be to beasts of every sort; and that the same weight of food will go much farther in nourishing or fattening an animal, if it be very pleasing to the palate of the animal to which it is given, than if it had been less tooth-

some. For, as a certain quantity of food is required for the mere sustenance of every animal, if that quantity be daily administered to it, and no more, the creature will barely subsist, but will never return any profit to the farmer. But, if the beast shall get a greater quantity of food than this portion which is barely necessary for subsistence, that surplus food then goes to augment the size, and to fatten the animal, and of course yields a profit to the farmer in proportion to its quantity.

As to *wedding*, the dock-weeder will be found a useful implement for taking out that mischievous perennial by the roots; nettles and other weeds may be cut with spades, or mown over; while some of the rushes and fern are best killed by hoisting the stem. Mosses greatly molest old pastures; and rich composts, harrowing, and drainage, are often necessary to be applied. The Code of Agriculture says that, 'to keep grass in good condition, a dressing of from thirty to forty cubic yards or cart-loads of compost is required every four years. The application of unmixed putrescent manure will thus be rendered unnecessary, which ought at least to be avoided, in meadows appropriated for the feeding of dairy cows, from its affecting the quality of the milk.' p. 476.

An eminent agriculturist observes that there seems to be a season, some time during the year, when grass lands, particularly old turf, should be eaten very close, not merely for the sake of preventing waste, but also for the purpose of keeping down the coarser kinds of plants, and giving to the pastures as equal and fine a sward as possible. The most proper period must partly depend upon the convenience of the grazier; but it can hardly be either immediately before the drought of summer or the frost of winter. Some time in autumn, when the ardent heat of the season is over, and when there is still time for a new growth before winter, may be most suitable for the land itself, and generally also for the grazier, his fat stock being then mostly disposed of, or carried to the after grass of mown grounds. The sweeping of pastures with the scythe may be employed as a substitute for this close feeding; the waste and labor of which, however, though they be but trifling, it does not seem necessary to incur on rich grazing lands, under correct management. Under the system of *fogging* pasture lands, fields in pasture are shut up early in May, and continued in that state till November or December, when the farmer's stock is turned in, and continue to pasture till the May succeeding. Such management, however, can only be advisable on a soil of the driest nature.

The chief improvements of which mountainous pastures are susceptible, according to Mr. Loudon, are those of draining and sheltering by plantations. 'Some parts might probably be enclosed by strips of plantation between stone walls, or by stone walls alone; but, as the stock on mountain pastures are generally under the care of a herdsman, the advantages of change of pasture, and alternate eating down and saving or sparing the grass, by keeping out the cattle, are obtainable without the use of fields.' But, in the words of an able contemporary, 'except in regard to those

necessary operations that have been already noticed—such as the extirpation of weeds and noxious shrubs, clearing away ant and mole-hills, &c., there are few points respecting the management of this kind of land on which some difference of opinion does not prevail. The time of stocking—the number of the animals, and whether all should be of one or of different species—the extent of the enclosures—and the propriety of eating the herbage close, or leaving it always in a rather abundant state—are all of them questions which it is scarcely possible to decide in a satisfactory manner by the application of general rules.' Mr. Marshal states that, in all cases where fattening cattle or dairy cows make a part of the stock, and where situation, soil, and water will permit, every suit of grazing grounds ought to consist of three compartments. One for head stock (as cows or fattening cattle); one for followers (as rearing and other lean stock); and the third to be shut up to freshen, for the leading stock.—*Marshal's Yorkshire*, vol. ii. p. 158.

PART III.

OF THE CONVERTIBLE OR ALTERNATE SYSTEM.

The Board of Agriculture, under the direction of government, was long engaged in an enquiry 'into the best means of converting portions of grass lands into tillage, without exhausting the soil, and of returning the same to grass, after a certain period, in an improved state, or at least without injury: and, while the author of the supplemental article on Agriculture in the *Encyclopædia Britannica* thinks the industry of the Board was ill-directed, much information was certainly collected by this means. Sir John Sinclair is confident that a 'much larger proportion of the United Kingdom than is at present so cultivated, might be subject to the alternate system of husbandry, or transferred from grass to tillage, and then restored to grass. Much of the middling sorts of grass lands, from 200 to 400 feet above the level of the sea, is of this description; and all well-informed husbandmen, and friends to the general prosperity of the country, regret that such lands are left in a state of unproductive pasturage, and excluded from tillage.

There are lands, however, respecting which it seems the general testimony was, that they ought never to be thus broken up; as strong clays, unfit for barley or turnips; soft clayey loams, with a clayey or marly sub-soil; and the deeper valley or river meadows, most of which improve annually while kept under good grazing management. The grass lands of Lincolnshire are instanced as the richest altogether in the kingdom. They let from £1 15s. to £3 per acre, and the value of the produce is from £3 to £10 per acre, arising from the beef, mutton, and wool, obtained, subject to little variation from the nature of the seasons. The stock maintained per acre on the best grazing lands surpasses what could be fed by any arable produce; it being not uncommon to feed at the rate of from six to seven sheep in summer, and two sheep in winter. The sheep, when put on the grass, may weigh from 18 lbs. to 20 lbs. per quarter, and the increase of weight

would be at the rate of 4 lbs. per quarter, or 16 lbs. per sheep. But suppose in an only 100 lbs. at 8d. per pound, that would amount to £3 17s. 10d. The wool would be worth about two guineas more, besides the value of the winter keep; and the total may be stated at about £7 per acre, got at little expense. Such lands cannot be better employed. From other causes, very light land, where sheep are both bred and fed, must, in part at least, be left as permanent pasture: and those of the county of Norfolk are here adduced in proof. Great injury has been sustained, we are told, by breaking up permanent pastures on such soils, more especially when subject to rectorial tithes: lands of an inferior soil, which kept two sheep on an acre, paying only vicarial tithes, and rented at 10s. per acre, since they have been broken up cannot pay, even without rent, both the tithe of corn and the expense of cultivation. In general it may be allowed that a farm lets best with a fair proportion of grass land upon it, which admits of a mixed management.

Under the following particulars are given, in the Code of Agriculture, the result of the information communicated to the Board: i. e. whether any previous steps are necessary before lands in grass are broken up; the proper mode of effecting that object; the course of crops; the manure necessary: the system of management during the rotation; the mode of laying down the land again to grass; that of sowing the grass-seeds; and the subsequent management.

1. If the land be wet, it is said to be advisable to drain it completely, previous to its being broken up; as it is not improbable that its being kept in pasture was partly on that account. Land that long has been in pasture does not require dung during the first course of crops that is taken after being broken up; but the application of calcareous manure is always, in such cases, expedient. Sometimes lime is spread on the ground before it is ploughed; at other times when it is either under summer fallow, or a drilled crop of turnips. Marl and chalk also have been used for the same purpose with great advantage. The land thence derives additional strength and vigor; the succeeding crops are much improved; the soil is commonly so softened in its texture that it may be ploughed with half the strength that would otherwise be necessary; and, whenever it is restored to grass, the herbage is abundant.

2. Wherever the soil is not too shallow, or friable, or when the turf cannot soon be rotted, if land is to be broken up from old pasture, paring and burning is the proper system. In this way good tilth is speedily procured; the damage that might otherwise be sustained by the grub, the wire-worm, and other insects, is avoided, while the soil receives a stimulus which ensures an abundant crop. Where paring and burning, from any circumstance, cannot take place, the land may be trenched or double-ploughed. This is effected by means of two ploughs following each other, the first plough taking off a thin surface of about three inches, and the second going deeper in the same place, covering the surface-sod with fine mould; both

furrows not exceeding the thickness of the vegetable mould or other good soil. If the land is ploughed with one furrow, the operation ought to be performed before winter, that it may receive the benefit of the succeeding frosts, by which the success of the future operations will not only be promoted, but most of the insects lodged in the soil will be destroyed. When one furrow alone is taken, the best size is four inches and a half deep by eight or nine broad. The strain on horses in ploughing ley land is mostly from the depth.

3. The rotation of crops to be adopted, when grass lands are broken up, must partly depend upon the soil, and partly on the manner in which it is prepared for cultivation. As a general principle, however, it may be laid down, that unless by the course of cropping to be pursued the bad grasses and other plants indigenous in the soil are extirpated, they will, when the land is again laid down to grass, increase and prevail with more rapidity and effect than seeds chosen by the farmer; and the consequence must be, a heavy disappointment to the future crops of grass, perhaps solely, or at least principally, attributable to a previous defective management. It is necessary, therefore, to enter into details upon this subject. The process of conversion in *clayey* soils should be commenced with paring and burning, especially where the grub is suspected. The following course may then be adopted:—1. Rape fed with sheep; 2. Beans; 3. Wheat; 4. Beans; 5. Wheat; 6. Fallow; 7. Wheat, sown with grass-seeds. This may seem severe cropping, but is justified by experience when old grass clay land is broken up. If the land has not been pared and burnt, the first crop ought to be either oats or dibbled beans. To do justice to the plan of restoring the land to grass, there ought to be, in all cases, according to the soil, either a naked or turnip fallow, before the sowing of grass-seeds be attempted. But on mellow loamy clay land, consisting of fine old grass pasture, where it is thought necessary or advisable to break up such land, it should be done in detached pieces, so as to suit the convenience of the occupier, and the following course should be adopted:—1. Autumnal ploughing for oats in spring; 2. Fallow for rape, to be eaten with sheep; 3. Beans; 4. Wheat, sown with clover; 5. Clover; 6. Clover; 7. Wheat; 8. Rape, to be partially eaten, and hoed in spring, and to stand for seed; and, 9. Wheat with grass-seeds. This is a very profitable rotation, and applicable to the best grazing land in Lincolnshire. As to chalk: Paring and burning is considered in this case to be indispensable as a preparation for turnips, which ought, where manure can be got, to be raised two years in succession; then barley, clover, wheat; and, after one or two additional crops of turnips, the land may be laid down with sainfoin to great advantage. Peat: On this soil paring and burning are essentially necessary. Under a judicious system, the greatest and quickest profit is thus secured to the farmer, with advantage to the public, and without injury to the landlord. Draining also must not be neglected. The crops to be grown on peat

soils are, 1. Rape or potatoes; 2. Oats; 3. Turnips; 4. Oats or wheat; and, 5. Clover, or grass-seeds. A liberal application of lime, where it can be obtained, is of the greatest service in enabling such soils to bring corn to its full perfection. In the fens of Thorney, the following course was recommended:—1. Paring and burning for rape; 2. Oats; and, 3. Wheat with grass-seeds; if the land was safe from water, the *Lammas* sort, if not spring wheat. This short course, it is contended, preserves the land in heart; and it afterwards produces abundant crops of grass. But long courses, in such a soil, run the lands to weeds and straw, without quality in the grain. Loam: The courses of crops applicable to this soil are too numerous to be here inserted. If the sward be friable, the following rotation may be adopted:—1. Oats; 2. Turnips; 3. Wheat or barley; 4. Beans; 5. Wheat; 6. Fallow or turnips; 7. Wheat or barley, and grass-seeds. If the sward be very tough and coarse, instead of taking oats, it may be pared and burnt for turnips. Sand: On rich and deep sandy soils, the most valuable crop that can be raised is carrots. For inferior sands, turnips, to be eaten on the ground, then to be laid down with barley and grass-seeds.

4. According to the improved system of laying down lands to grass, they ought to be previously made as clean and fertile as possible. With that view, all the green crops raised ought to be consumed upon the ground; fallow or fallow crops ought not to be neglected; and the whole straw of the corn crops should be converted into manure, and applied to the soil that produced it. Above all, the mixing of calcareous matter with the soil, either previous to, or during the course of cropping, is essential; and nothing generally improves meadows or pastures more than lime or marl.

5. It is disputed whether grass-seeds should be sown with or without corn. In favor of the first practice, that of uniting the two crops, it is maintained that, where equal pains are taken, the future crop of grass will succeed equally well as if they had been sown separately, while the same tilth answers for both. On the other hand it is observed, that as the land must, in that case, be put into the best possible order, there is a risk that the corn crop will grow so luxuriantly, as to overpower the grass-seeds, and, at any rate, will exclude them from the benefit of the air and the dews. If the season also be wet, a corn-crop is apt to lodge, and the grass will, in a great measure, be destroyed. On soils moderately fertile, the grasses have a better chance of succeeding; but then, it is said, that the land is so much exhausted by producing the corn-crops, that it seldom proves good grass land afterwards. In answer to these objections, it has been urged that where, from the richness of the soil, there is any risk of sowing a full crop of corn, less seed is used, even as low as one-third of the usual quantity; and that a moderate crop of grain nurses the young plants of grass, and protects them from the rays of a hot sun, without producing any material injury. Where the two crops are united, barley is the preferable grain, except on peat. Barley has a tendency to loosen

the texture of the ground in which it grows, which is favorable to the vegetation of grass-seeds. In the choice of barley, that sort should be preferred which runs least to straw, and which is the soonest ripe. On peat, a crop of oats is to be preferred. The manner of sowing the grass-seeds requires to be particularly attended to. Machines have been invented for that purpose, which answer well, but they are unfortunately too expensive for the generality of farmers. It is said to be a bad system to mix seeds of different plants before sowing them, in order to have the fewer casts. It is better to sow each sort separately, for the expence of going several times over the ground is nothing, compared to the benefit of having each sort equally distributed. The seeds of grasses, being so light, ought never to be sown in a windy day, except by machinery, an equal delivery being a point of great consequence. Wet weather ought likewise to be avoided, as the least degree of poaching is injurious. Grass-seeds ought to be well harrowed, according to the nature of the soil.

6. When the corn is carried off, the young crop of grass should be but little fed during autumn, and that only in dry weather; but heavily rolled in the following spring, in order to press the soil home to the roots. It is then to be treated as permanent pasture. By attention to these particulars, the far greater proportion of the meadows and pastures in the kingdom, of an inferior, or even medium quality, may be broken up, not only with safety, but, as we are told, with great profit.

PART IV.

OF THE CULTIVATION OF PLANTS THAT ARE ARTICLES OF COMMERCE.

These in general are such as cannot be used for food; and are principally flax, hemp, rape, hops, and timber of various kinds.

Of flax and hemp.—Flax is cultivated not only with a view to the common purposes of making linen, but for the sake of its seed also; and thus forms a most extensive article of commerce, all the oil used by painters, at least for common purposes, being extracted from this seed. See *FLAX, FLAX-DRESSING, and LINUM*. The cake which remains after the extraction of the oil is in some places used as a manure, and in others sold for fattening of cattle. In the vale of Gloucester, Mr. Marshal informs us that it is, next to hay, a main article of stall fattening; though the price is often great. Hence some individuals have been induced to try the effect of lint-seed itself boiled to a jelly, and mixed with flour, bran, or chaff, with good success; and even the oil itself has been tried for the same purpose in Herefordshire. Though this plant is in universal culture over the whole kingdom, yet it appears, by the vast quantity imported, that by far too little ground is employed in that way; as Mr. Marshal takes notice of its culture only in Yorkshire, and here, he tells us, its cultivation is confined to a few districts. The kind cultivated is that called ‘blea-line,’ or the blue or lead colored flax, and this requires a rich dry soil for its cultivation.

A deep, fat, sandy loam is perhaps the only soil on which it can be cultivated with advantage. If sown upon old corn land, it ought to be well cleaned from weeds, and rendered perfectly friable by a summer fallow. Manure is seldom or ever set on for a line crop; and the soil process consists generally of a single ploughing. The seed time is May, but much depends on the state of the soil at the time of sowing. ‘It should neither be wet nor dry; and the surface ought to be made as fine as that of a garden-bed. Not a clod of the size of an egg should remain unbroken.’ Two bushels of seed are usually sown upon an acre; the surface, after being harrowed, is sometimes raked with garden or hay-rakes; and the operation would be still more complete if the clods and other obstructions, which cannot be easily removed, were drawn into the interfurrows. A light hand-roller used between the final raking and harrowing would much assist this operation. The chief requisite during the time of vegetation is weeding, which ought to be performed with the utmost care; and for this reason it is particularly requisite that the ground should be previously cleansed as well as possible, otherwise the expence of weeding becomes too great to be borne, or the crop must be considerably injured. It is an irreparable injury, if, through a dry season, the plants come up in two crops; or if by accident or mismanagement they be too thin. The goodness of the crop depends on its running up with a single stalk without branches; for wherever it ramifies there the length of the line terminates; and this ramification is the consequence of its having too much room at the root, or getting above the plants which surround it. The branches are never of any use, being unavoidably worked off in dressing; and the stem itself, unless it bear a due proportion to the length of the crop, is likewise worked off among the refuse. The ramification of the flax will readily be occasioned by clods on the ground when sown. A second crop is very seldom attended with any profit; for, being overgrown with the spreading plants of the first crop, it remains weak and short, and at pulling time is left to rot upon the land.

Flax is injured not only by drought, but by frost, and is sometimes attacked, even when got five or six inches high, by a small white slug, which strips off the leaves to the top, and the stalks bending with their weight are thus sometimes drawn into the ground. Hence, if the crop does not promise fair at weeding time, our author advises not to bestow further labor and expence upon it. A crop of turnips or rape will generally pay much better than such a crop of flax. The time of flax harvest in Yorkshire is generally in the latter end of July, or beginning of August. On the whole, our author remarks, that ‘the goodness of the crop depends in some measure upon its length; and this upon its evenness and closeness upon the ground. Three feet high is a good length, and the thickness of a crow’s quill a good thickness. A fine stalk affords more fine and fewer shivers than a thick one. A tall thick set crop is therefore desirable. But, unless the land be good, a thick crop cannot attain a sufficient length of stem. Hence the

folly of sowing flax on land which is unfit for it. Nevertheless, with a suitable soil, a sufficiency of seed evenly distributed, and a favorable season, flax may turn out a very profitable crop. The flax crop, however, has its disadvantages; it interferes with harvest, and is generally believed to be a great exhauster of the soil, especially when its seed is suffered to ripen. Its cultivation ought therefore to be confined to rich grass-land districts, where harvest is a secondary object, and where its exhaustion may be rather favorable than hurtful to succeeding arable crops, by checking the too great rankness of rich fresh broken ground.

In vol. ii. of Bath Papers, a Dorsetshire gentleman, who writes on the culture of hemp and flax, gives an account somewhat different from that of Mr. Marshall. Instead of exhausting crops, he maintains that they are both ameliorating crops if cut without seeding; and, as the best crops of both are raised from foreign seed, he is of opinion that there is little occasion for raising it in this country. A crop of hemp, he insists, prepares the land for flax, and is therefore clear gain to the farmer. 'That these plants impoverish the soil,' he repeats, 'is a mere vulgar notion, devoid of all truth. The best historical relations, and the verbal accounts of honest ingenious planters, concur in declaring it to be a vain prejudice, unsupported by any authority; and that these crops really meliorate and improve the soil.' He is likewise of opinion that the growth of hemp and flax is not necessarily confined to rich soils, but that they may be cultivated with profit also upon poor sandy ground, if a little expense be laid out in manuring it. 'Spalding Moor in Lincolnshire is a barren sand; and yet with proper care and culture it produces the best hemp in England, and in large quantities. In the Isle of Axholme, in the same county, equal quantities are produced; for the culture and management of it is the principal employ of the inhabitants; and, according to Leland, it was so in the reign of Henry VIII. In Marshland the soil is a clay or strong warp, thrown up by the river Ouse, and of such a quality that it cracks with the heat of the sun, till a hand may be put into chinks; yet, if it be once covered with the hemp or flax before the heats come on, the ground will not crack that summer. When the land is sandy, they first sow it with barley, and the following spring they manure the stubble with horse or cow dung, and plough it under. Then they sow their hemp or flax, and harrow it in with a light harrow, having short teeth. A good crop destroys all the weeds, and makes it a fine fallow for flax in the spring. As soon as the flax is pulled, they prepare the ground for wheat. Lime, marl, and the mud of ponds, is an excellent compost for hemp lands.' Our author takes notice of the vast quantity of flax and hemp, not less than 11,000 tons, imported formerly into Britain; and complains that it is not all raised in the island. He observes that the greater part of those marshy lands lying to the west of Mendip hills are very proper for the cultivation of hemp and flax; and if laid out in this manner could not fail of turning out highly advantageous both to the land-

holders and the public at large. 'The vast quantities of hemp and flax,' says he, 'which have been raised on lands of the same kind in Lincolnshire marshes, and the fens of the Isle of Ely and Huntingdonshire, are a full proof of the truth of my assertion. Many hundreds of acres in the above mentioned places, which for pasturage or grazing were not worth more than 20s. or 25s. per acre, have been readily let at from £2 to £4.

Choice of the soil, and preparing the ground. —A skilful flax-raiser always prefers in Scotland, we are told, a free open deep loam, and all grounds that produced the preceding year a good crop of turnips, cabbages, potatoes, barley, or broad clover, or have been formerly laid down rich, and kept for some years in pasture. A clay soil, the second or third crop after being limed, will answer well for flax; provided, if the ground be still stiff, that it be brought to a proper mould, by tilling after harvest to expose it to winter frosts. All new grounds produce a strong crop of flax, and pretty free of weeds. When many mole-hills appear upon new ground, it answers the better for flax after one tilling. The seed ought never to be sown on grounds that are either too wet or dry, but on such as retain a natural moisture; and such grounds as are inclined to weeds ought to be avoided, unless prepared by a careful summer fallow. If the linseed be sown early, and the flax not allowed to stand for seed, a crop of turnip may be got after the flax that very year; the second year a crop of rye or barley may be taken; and the third year grass seeds are sometimes sown along with the linseed. This is the method mostly practised in and about the counties of Lincoln and Somerset, where great quantities of flax and hemp are every year raised, and where these crops have long been capital articles. There old ploughed grounds are never sown with linseed, unless the soil be very rich and clean. A certain worm, called in Scotland the coup worm, abounds in new ploughed grounds, which greatly hurts every crop but flax. In small enclosures, surrounded with trees or high hedges, the flax, for want of free air, is subject to fall before it is ripe, and the droppings of rain and dew from the trees prevent the flax within the reach of the trees from growing to any perfection. Of preceding crops, potatoes and hemp are the best preparation for flax. In the fens of Lincoln, upon proper ground of old tillage they sow hemp, dunging well the first year; the second year hemp without dung; the third year flax without dung; and that same year a crop of turnip eat on the ground by sheep; the fourth year hemp with a large coat of dung; and so on successively. If the ground be free and open, it should be but once ploughed, and that as shallow as possible, not deeper than two inches and a half. It should be laid flat, reduced to a fine garden mould by good harrowing, and all stones and sods should be carried off. Except a little pigeon's dung for cold or sour ground, no other dung should be used preparatory for flax; because it produces too many weeds, and throws up the flax thin and poor upon the stalk. Before sowing, the bulky clods should be broken,

or carried off the ground; and stones, quickenings, and every other thing that may hinder the growth of the flax, should be carefully taken away.

Choice of seed.—The brighter in color, and heavier the seed is, so much the better; that which, when bruised, appears of a light or yellowish green, and fresh in the heart, oily, and not dry, and smells and tastes sweet, and not fusty, may be depended upon. Dutch seed of the preceding year's growth for the most part answers best; but it seldom succeeds if kept another year. It ripens sooner than any other foreign seed. Philadelphia seed produces fine lint and few bolls, because sown thick, and answers best in wet cold soils. Riga seed produces coarser lint, and the greatest quantity of seed. Scotch seed, when well wonned and kept and changed from one kind of soil to another, sometimes answers pretty well; but should be sown thick, as many of its grains are bad, and fail. It springs well, and its flax is sooner ripe than any other; but its produce afterwards is generally inferior to that from foreign seed. A kind has been lately imported, called Memel seed; which looks well, is short and plump, but seldom grows above eight inches, and on that account ought not to be sown.

Method of sowing.—The quantity of lintseed sown should be proportioned to the condition of the soil; for if the ground be in good heart, and the seed sown thick, the crop will be in danger of falling before it is ready for pulling. In Scotland, from eleven to twelve pecks, Linlithgow measure, of Dutch or Riga seed, is generally thought sufficient for one acre; and about ten pecks of Philadelphia seed, which, being the smallest grained, goes farthest. Riga lintseed, and the next year's produce of it, is preferred in Lincolnshire. The time for sowing lintseed is from the middle of March to the end of April, as the ground and season answer; but the earlier the seed is sown, the less the crop interferes with the corn-harvest. Late sown lintseed may grow long, but the flax upon the stalk will be thin and poor. After sowing, the ground ought to be harrowed till the seed is well covered, and then (supposing the soil, as before mentioned, to be free, and reduced to a fine mould) it ought to be rolled. When a farmer sows a large quantity of lintseed, he may find it proper to sow a part earlier and part later, that in the future operations of weeding, pulling, watering, and grassing, the work may be the easier and more conveniently gone about. It ought always to be sown on a dry bed.

Weeding.—Flax ought to be weeded when the crop is about four inches long. If longer deferred, the weeders will so much break and bend the stalks that they will never perhaps recover their straightness again; and, when the flax grows crooked, it is more liable to be hurt in the rippling and swinging. Quicken-grass should not be taken up; for, being strongly rooted, the pulling of it always loosens a deal of the lint. If there is an appearance of a settled drought, it is better to defer the weeding, than by that operation to expose the tender roots of the flax to the drought. So soon as the weeds

are got out, they ought to be carried off the field, instead of being laid in the furrow, where they often take root again, and at any rate obstruct the growth of the flax in the furrows.

For the cultivation, natural history, dressing, importation, uses, &c., of hemp, see *CANNABIS* and *HEMP*.

We may subjoin in this place a few practical remarks on *rape* or *cole seed*. This, as well as lintseed, is cultivated for the purpose of making oil, and will grow almost any where. Mr. Hazard says that in the north of England the farmers pare and burn their pasture lands, and then sow them with rape after one ploughing; the crop commonly standing for seed. Poor clay, or stone brash land, will often produce from twelve to sixteen or eighteen bushels per acre, and almost any fresh or virgin earth will yield one plentiful crop; so that many in the northern counties have been raised, by cultivating this seed, from poverty to affluence. The seed is ripe in July, or the beginning of August; and the threshing of it out is conducted with the greatest mirth and jollity. The rape, being fully ripe, is first cut with sickles, and then laid thin upon the ground to dry; and, when in proper condition for threshing, the neighbours are invited, who readily contribute their assistance. The threshing is performed on a large cloth in the middle of the field, and the seed put into sacks and carried home. It does not admit of being carried from the field in the pod, to be threshed at home, and therefore the operation is always performed in the field; and, by the number of assistants procured on this occasion, a field of twenty acres is frequently threshed out in one day. The straw is burnt for the sake of its alkali, the ashes being said to equal the best kind of those imported from abroad. The proper time for sowing rape is June; and the land should, previously to the sowing, be twice well ploughed. About two pounds of seed are sufficient for an acre; and, according to our author, it should be cast upon the ground with only the thumb and two fore-fingers; for, if it be cast with all the fingers, it will come up in patches. If the plants come up too thick, a pair of light harrows should be drawn along the field length-ways and cross-ways, by which means the plants will be equally thinned; and, when the plants which the harrows have pulled up are withered, the ground should be rolled. A few days after, the plants may be set out with a hoe, allowing sixteen or eighteen inches distance betwixt every two plants.

Mr. Hazard strongly recommends the transplanting of rape, having experienced the good effects of it himself. A rood of ground, sown in June, will produce as many plants as are sufficient for ten acres; which may be planted out upon ground that has previously borne a crop of wheat, provided the wheat be harvested by the middle of August. One ploughing will be sufficient for these plants; the best of which should be selected from the seed-plot, and planted in rows two feet asunder, and sixteen inches apart in the rows. As rape is an excellent food for sheep, they may be allowed to feed upon it in the spring; or the leaves might be gathered, and

given to oxen or young cattle : fresh leaves would sprout again from the same stalks, which in like manner might be fed off by ewes and lambs in time enough to plough the land for a crop of barley and oats. Planting rape in the beginning of July, however, would be most advantageous for the crop itself, as the leaves might then be fed off in the autumn, and new ones would appear in the spring. Our author discommends the practice of sowing rape with turnips, as the crops injure one another. 'Those who look for an immediate profit,' says he, 'will undoubtedly cultivate rape for seed; but perhaps it may answer better in the end to feed it with sheep: the fat ones might cull it over first, and afterwards the lean or store-sheep might follow them, and be folded thereon: if this is done in autumn season, the land will be in good heart to carry a crop of wheat; or, where the rape is fed off in the spring, a crop of barley might follow. In either case, rape is profitable to the cultivator; and when it is planted, and well earthed round the stems, it will endure the severest winter; but the same cannot be advanced in favor of that which is sown broad cast.' In the Agricultural Survey of Kent it is remarked, that this seed is much cultivated on the poor lands of the eastern part of that county, under the same management as turnips. Sometimes, although rarely, it is sown for seed; but most commonly fed off with lean flocks of sheep. Cattle and sheep, when poor, are however very subject to be destroyed by eating greedily of this plant.

Of coriander, canary, and some other seeds.—Coriander is used in large quantities by distillers, druggists, and confectioners, and might be a considerable object to such farmers as live in the neighbourhood of great towns; but the price is very variable. In the fourth volume of Bath Papers, Mr. Bartley gives an account of an experiment made on this seed, which proved very successful. Ten perches of good sandy loam were sown with coriander in March. 3 lbs. of seed were sufficient for this spot; and the whole expense amounted only to 5s. 10d. The produce was 87 lbs. of seed, which, valued at 3d., yielded a profit of 15s. 11d. or £15 18s. 4d. per acre. He afterwards made several other experiments on a larger scale; but none of the crops turned out so well, though all of them afforded a good profit.

Canary seed has been cultivated in large quantities in the Isle of Thanet, where it is said they have had frequently twenty bushels to an acre. Mr. Bartley sowed half an acre of ground, the soil a mixture of loam and clay, but had only eight bushels and a half, or seventeen bushels per acre. With this produce, however, he had a profit of £4 2s. 3d. per acre.

In Kent, where this seed is much cultivated, Mr. Boys says, there are three kinds of tilths for it, viz. summer fallow, bean stubble, and clover lay; the last he considers the best. If the land is not very rich, a coat of rotten dung is frequently spread for it. Whether manured or not, the tillage necessary is to plough the land the first opportunity that offers after wheat-sowing is done; and, as soon as the land is tolerably dry in the spring, furrows are made about eleven or

twelve inches apart, and the seed is sown broadcast, about four or five gallons per acre, and well harrowed in. When the blade appears, and the rows are distinct, the intervals are immediately hoed with a Dutch hoe, and afterwards, in May or June, the hoeing is repeated with a common hoe: carefully cutting up every weed, and thinning the plants in the furrows, if they are too thick. It is cut in the harvest, which is always later than any corn crop, with a hook, called a twibil and a link; by which it is laid in lumps, or wads, of about half a sheaf of each. The seed clings remarkably to the husk; and, to detach it, the crop must be left a long time on the ground to receive moisture sufficient to destroy the texture of the envelopment, otherwise it would be hardly possible to thresh out the seed. The wads are turned from time to time, to have the full benefit of the rains and sun.

Radish seed.—For this crop the land should be clean, full of manure, and ploughed a good depth in the early part of the winter. In Kent they cultivate the early short top, the salmon, and the turnip rooted. The seed is sown on furrows, about ten inches apart: in a dry time in the month of March, about two or three gallons per acre. As soon as the plants appear, every other row is cut up with a horse-hoe, leaving the rows twenty inches apart. When the plants get two or three rough leaves, they are hoed out in rows, and are then kept clean by repeated horse and hand-hoeing when necessary, leaving the plants at about eighteen inches distance. The crop is seldom fit to reap till October, and sometimes is out in the fields till Christmas, without receiving injury from wet weather: it being necessary that it should have much rain to rot the pods, that it may thresh well. The produce is from eight to twenty-four bushels per acre.

Spinach seed.—Two sorts of this seed are cultivated, the prickly and the round: both are sown in furrows, about twelve or fourteen inches apart; the prickly, six gallons per acre, and the round four. Early in March, when the plants have leaves about an inch or two in length, they are hoed out to the distance of four or five inches. When the crop is in full bloom, the greater part of the male plants are drawn out by hand, and given profitably to young pigs; by which operation the female plants have more room to grow, and perfect their seed. The crop, when ripe, is pulled up, and threshed in the field on a cloth, or carried to the barn for that purpose.

Of woad.—The use of woad in dyeing is well known (see ISATIS and WOAD), and the consumption is so great that the raising of the plant might undoubtedly be an object to a husbandman, provided he could get it properly manufactured for the dyers, and could overcome their prejudices. The growing of this plant was long in a manner monopolised in particular places, particularly at Keynsham near Bristol. Mr. Bartley informs us that, in a conversation he had with these growers, the latter asserted that the growth of woad was peculiar to their soil. This is a blackish heavy mould, with a

considerable proportion of clay; but works freely; that of Brislington, where Mr. Bartley resided, was a hazel, sandy loam: nevertheless, having sowed half an acre of this soil with woad seed, it thrives so well that he never saw a better crop at Keynsham. Woad grows to the greatest advantage on a light black rich soil, which has a southern situation. Land intended for it should be dunged a year before it is sown with this plant, and made first to bear a crop of wheat, &c. This being taken off, three deep stirrings should be given with the plough, the first in November, and the other two in spring. It is often sown so early as in the beginning of April; but, when it is too cold at that period, the sowing must be deferred till May. In this climate, however, it is often not sown until some time later.

In some parts of Kent this plant is much cultivated. It is frequently sown on poor, stiff, and some chalky lands, in the proportion of ten or twelve lbs. of seed to the acre, and among beans before the last hoeing in the beginning of July. It requires no culture while growing, unless the land be full of weeds; in which case the weeds must be drawn out by the hand, or cut up with a narrow hoe. When the plants have produced their bloom up to the top of the stem, they are pulled up, then tied by a single stalk in small handfuls, and set up in a conical form to ripen. When thoroughly dry, the seed is shaken out on a cloth or into a tub, the plants being then bound with rope-yarn into bundles, each weighing 30 lbs.: sixty of these bundles make a load of woad, the price of which is generally from £4 to £10. The Keynsham growers are said to cultivate and prepare it in the best manner.

Of madder.—This is a plant also used by the dyers. See DYEING and RUBIA. It was formerly much cultivated in the eastern part of Kent: 'I am firmly persuaded,' says Mr. Boys, 'that good crops of excellent madder may be raised in Kent, on soils properly adapted for the purpose; and that it would be a profitable article of culture, if it were never under £3 per cwt., nor would the buyers be injured by a restriction to this price; but then the legislature must interfere to prevent the importation of the root from Holland, where it can be cultivated cheaper. Perhaps, (said he before the peace,) if that country should continue unfriendly to us, it might be good policy to encourage the growth of madder at home. I have many years been in the habit of cultivating it; but, from the low price at market, have been obliged to abandon it. There have been several modes of planting practised; but that which appears the best is to plant it in single rows, about two feet apart. The land should be perfectly clean from weeds, and have been well manured the preceding year, so that the dung may be well incorporated with the soil; which should be a fine deep, rich, sandy loam, without any redundancy of moisture. To prepare the land for planting, it should be ploughed in the autumn, to have the benefit of the winter's frost, and harrowed in dry weather in the spring, and then kept clean by horse-hoeing, until the plants are ready for drawing, which is usually by the end of May, or beginning of June: the

proper time is known by the plants having got to the height of ten or twelve inches from the ground, and having produced roots branching out from the bottom of the suckers which will be perceived by drawing up a few of them. When the suckers are in this state, all hands necessary for this work are to be provided, that the operation may proceed with every possible despatch. One acre requires about 20,000 plants. The plants should have about one-third of their tops cut off, and then their roots should be dipt in earth, or fine mould and water beaten together to the consistence of batter; which prevents the necessity of watering them. It requires one woman to dip the plants, two to carry and strew them in handfuls along the furrow, and about seven to follow the plough. The land should be ploughed with a strong turnwrest plough with six horses, twelve or fourteen inches deep: women attend to lay the plants about eight or nine inches apart in every other furrow, leaning off from the plough: by which, every time the plough returns, the row of plants laid in by women who follow the plough is covered with the earth of the furrow. The crop must be kept perfectly clean by the hoe and hand weeding during the summer months, and earthed up with the plough each autumn until the third after planting, when the roots are dug up by trenching the land two feet deep; two children attending each digger, in order to pick out the roots.

The most proper time to take up the roots is when they are about the size of a swan's quill; they then yield most dye, and are of course most proper for use; but the time when they arrive at this proper state depends not only on the nature of the soil in which they have been planted, but also on the good husbandry that has been bestowed on the land.

For Hops, see that article.

In Vol. II. of his Annals, Mr. Young informs us, that 'one profit of hop land is that of breaking it up. Mr. Potter grubbed up one garden, which failing, he ploughed and sowed barley, the crop great; then mazagan beans, two acres of which produced sixteen quarters and five bushels. He then sowed it with wheat, which produced thirteen quarters and four bushels and a half; but since that time the crops have not been greater than common. The same gentleman has had ten quarters of oats after wheat.' In the ninth volume there is an account of an experiment by Mr. Le Bland of Sittingbourne in Kent, of grubbing up twelve acres of hop ground. Part of the hops were grubbed up and mazagan beans sown in their stead; but the seed being bad, and the summer dry, the crop turned out very indifferent. Next year the remainder of the hops were grubbed up, and the whole twelve acres sown with wheat; but still the crops turned out very bad, owing to the wet summer of that year. It was next planted with potatoes, which turned out well; and ever since that time the crops have been good. This gentleman informs us that the person who had the hop ground above mentioned did not lose less by it than £1500.

The culture of hops seems to be confined in a

great measure to the southern counties of England; for Mr. Marshal mentions it as a matter of surprise that in Norfolk he saw a 'tolerably large hop garden.' The proprietor informed him that three or four years before there had been ten acres of hops in the parish (Blowfield), where he resided; which was more than could be collected in all the rest of the county; but at that time there were not above five; and the culture was daily declining; as the crops, owing to the low price of the commodity, did not defray the expense. It is clear enough that hops are the most uncertain and precarious crop on which the husbandman can bestow his labor. Mr. Young is of opinion that some improvement in the culture is necessary; but he does not mention any, excepting that of planting them in espaliers, a method long since recommended both by Mr. Rogers and Mr. Potter. The former took the hint from observing that a plant which had been blown down, and afterwards shot out horizontally, always produced a greater quantity than those which grew upright. He also remarks that hops which are late picked carry more next year than such as are picked early; for which reason he recommends the late picking. The only reason for picking early is that the hops appear much more beautiful than the others.

Of the cultivation of apples and pears.—In Herefordshire and Gloucestershire the cultivation of fruit, for the purpose of making a liquor from the juice, forms a principal part of their husbandry. In Devonshire also considerable quantities of this kind of liquor are made, though much less than in these two counties. For the cultivation, curing, and management of fruit trees in general, see HORTICULTURE.

The fruits cultivated in Herefordshire and Gloucestershire are the apple, pear, and cherry. From the two first are made the liquors named cyder and perry. See CYDER and PERRY. Mr. Marshal remarks that nature has furnished only one species of pears and apples, viz. the common crab of the woods and hedges, and the wild pear, which is also pretty common. The varieties of these fruits are entirely artificial, being produced not from seed, but by a certain mode of culture; whence it is the business of those who wish to improve fruit to catch at superior accidental varieties; and, having raised them by cultivation to the highest perfection of which they are capable, to keep them in that state by artificial propagation. Mr. Marshal, however, observes that it is impossible to make varieties of fruit altogether permanent, though their duration depends much upon management. 'A time arrives,' says he, 'when they can no longer be propagated with success. All the old fruits which raised the fame of the liquors of this country are now lost, or so far on the decline as to be deemed irrecoverable. The redstreak is given up; the celebrated stir-apple is going off; and the squash-pear, which has probably furnished this country with more champagne than was ever imported into it, can no longer be got to flourish; the stocks canker, and are unproductive. In Yorkshire similar circumstances have taken place; several old fruits which were

productive within my own recollection are lost; the stocks cankered, and the trees would no longer come to bear.' Our author controverts the common notion among orchard men that the decline of the old fruits is owing to a want of fresh grafts from abroad, particularly from Normandy, whence it is supposed that apples were originally imported into this country. Mr. Marshal, however, thinks that these original kinds have been long since lost, and that the numerous varieties of which we are now possessed were raised from seed in this country. At Ledbury he was shown a Normandy apple-tree, which, with many others of the same kind, had been imported immediately from France. He found it, however, to be no other than the bitter-sweet, which he had seen growing as a neglected wilding in an English hedge.

The process of raising new varieties of apples, Mr. Marshal says, is simple and easy. 'Select among the native species individuals of the highest flavor; sow the seeds in a highly enriched seed-bed. When new varieties, or the improvement of old ones, are the objects, it may be eligible to use a frame or stove; but, where the preservation of the ordinary varieties only is wanted, an ordinary loamy soil will be sufficient. At any rate, it ought to be perfectly clean at least from root weeds, and should be double dug from a foot to eighteen inches deep. The surface being levelled, and raked fine, the seeds ought to be scattered on about an inch asunder, and covered about half an inch deep with some of the finest mould previously raked off the bed for that purpose. During summer the young plants should be kept perfectly free from weeds, and may be taken up for transplantation the ensuing winter; or, if not very thick in the seed bed, they may remain in it till the second winter. The nursery ground ought also to be enriched, and double dug to the depth of fourteen inches at least; though eighteen or twenty are preferable. The seedling plants ought to be sorted agreeably to the strength of their roots, that they may rise evenly together, the top or downward roots should be taken off, and the longer side rootlets shortened. The young trees should then be planted in rows three feet asunder, and from fifteen to eighteen inches distant in the rows; taking care not to cramp the roots but to lead them evenly and horizontally among the mould. If they be intended merely for stocks to be grafted, they may remain in this situation until they are large enough to be planted out; though, in strict management, they ought to be re-transplanted two years before their being transferred into the orchard, 'in fresh but unmanured double-dug ground, a quincunx four feet apart every way.' In this second transplantation, as well as in the first, the branches of the root ought not to be left too long, but to be shortened in such a manner as to induce them to form a globular root, sufficiently small to be removed with the plant; yet sufficiently large to give it firmness and vigor in the plantation.

Having thus proceeded with the seed bed, our author adds the following directions:—'Select from among the seedlings the plants whose wood and leaves wear the most apple-like ap-

pearance. Transplant these into a rich deep soil in a genial situation, letting them remain in this nursery until they begin to bear. With the seeds of the fairest, richest, and best flavored fruit, repeat this process; and at the same time, or in due season, engraft the wood which produced this fruit on that of the richest, sweetest, best flavored apple; repeating this operation, and transferring the subject under improvement from one tree and sort to another, as richness, flavor, or firmness may require; continuing this double mode of improvement until the desired fruit be obtained. There has, no doubt, been a period when the improvement of the apple and pear was attended to in this country; and, should not the same spirit of improvement revive, it is probable that the country will, in a course of years, be left destitute of valuable kinds of these two species of fruit; which, though they may in some degree be deemed objects of luxury, long custom seems to have ranked among the necessities of life.'

In the Bath Papers, Vol. IV., Mr. Grimwood supposes the degeneracy of apples to be rather imaginary than real. He says that the evil complained of 'is not a real decline in the quality of the fruit, but in the tree; owing either to want of health, the season, soil, mode of planting, or the stock they are grafted on being too often raised from the seed of apples in the same place or county. I have not a doubt in my own mind, but that the trees which are grafted on the stocks raised from the apple-pips are more tender than those grafted on the real crab-stock; and the seasons in this country have, for many years past, been unfavorable for fruits, which add much to the supposed degeneracy of the apple. It is my opinion that, if planters of orchards would procure the trees grafted on real crab-stocks from a distant country, they would find their account in so doing much overbalance the extra expence of charge and carriage.' In the same volume, Mr. Edmund Gillingwater assigns as a reason for the degeneracy of apples the mixture of various farina, from the orchards being too near each other. In consequence of this notion, he also thinks that the oldest and best kinds of apple-trees are not lost, but only corrupted from being planted too near bad neighbours: 'Remove them,' says he, 'to a situation where they are not exposed to this inconvenience, and they will immediately recover their former excellency.'

With regard to the method of cultivating fruit-trees, it is only necessary to add that, while they remain in the nursery, the intervals betwixt them may be occupied by such kitchen-stuff as will not crowd or overshadow the plants; keeping the rows in the mean time perfectly free from weeds. In pruning them, the leader should be particularly attended to. If it shoot double, the weaker of the contending branches should be taken off; but if the leader be lost, and not easily recoverable, the plant should be cut down to within a hand's breadth of the soil, and a fresh stem trained. The undermost boughs should be taken off by degrees, going over the plants every winter; but taking care to preserve heads of suffi-

cient magnitude not to draw the stems up too tall, which would make them feeble in the lower part. The stems in Herefordshire are trained to six feet high; but our author prefers seven, or even half a rood in height. A tall stemmed tree is much less injurious to what grows below it than a low headed one, which is itself in danger of being hurt, at the same time that it hurts the crop under it. The thickness of the stem ought to be in proportion to its height; for which reason a tall stock ought to remain longer in the nursery than a low one. The usual size at which they are planted out in Herefordshire is from four to six inches girt at three feet high; which size, with proper management, they will reach in seven or eight years. The price of these stocks in Herefordshire is eighteen pence each.

In Herefordshire it is common to have the ground of the orchards in tillage, and in Gloucestershire in grass; which Mr. Marshal supposes to be owing to the difference betwixt the soil of the two counties; that of Herefordshire being generally arable, and Gloucester grass land. Trees, however, are very destructive not only to a crop of corn, but to clover and turnips; though tillage is favorable to fruit trees in general, especially when young. In grass grounds their progress is comparatively slow, for want of the earth being stirred about them, and by being injured by the cattle, especially when low-headed and drooping. After they begin to bear, cattle ought by all means to be kept away from them, as they not only destroy all the fruit within their reach, but the fruit itself is dangerous to the cattle, being apt to stick in their throats and choke them. These inconveniences may be avoided by eating the fruit grounds bare before the gathering season, and keeping the boughs out of the way of the cattle; but Marshal is of opinion that it is wrong to plant orchards in grass land. 'Let them,' says he, 'lay their old orchards to grass; and, if they plant, break up their young orchards to arable. This will be changing the course of husbandry, and be at once beneficial to the land and to the trees.' Our author complains very much of the indolent and careless method in which the Herefordshire and Gloucestershire farmers manage their orchards.

Blight is a term, as applied to fruit trees, which Mr. Marshal thinks is not understood. Two bearing years, he remarks, seldom come together; and he is of opinion that it is the mere exhausting of the trees by the quantity of fruit which they have carried one year that prevents them from bearing any the next. The only thing therefore that can be done in this case is to keep the trees in as healthy and vigorous a state as possible. Insects destroy not only the blossoms and leaves, but some of them also the fruit, especially pears. Mr. Marshal advises to set a price upon the female wasps in the spring; by which these mischievous insects would perhaps be exterminated, or at least greatly lessened.

An excess of fruit stunts the growth of young trees, and renders all in general barren for two or three years; while in many cases the branches are broken off by the weight of the fruit; and in one case Mr. Marshal mentions that an entire

tree had sunk under its burden. To prevent as much as possible the bad effects of an excess of fruit, Mr. Marshal recommends to graft in the boughs, and when fully grown to thin the bearing branches; thus endeavouring, like the gardener, to grow fruit every year.

Though it is impossible to prevent the effects of old age, yet, by proper management, the natural life of fruit-trees may be considerably protracted. The most eligible method is to graft stocks of the native crab in the boughs. The decline of the tree is preceded by a gradual decline of fruitfulness, which long takes place before the tree manifests any sign of decay. During this decline of fruitfulness there is a certain period when the produce of a tree will no longer pay for the ground it occupies, and beyond this period it ought by no means to be allowed to stand. In the Vale of Gloucester, however, our author saw an instance of some healthy bearing apple trees, which then had the second tops to the same stems. The former tops, having been worn out, were cut off, and the stumps saw-grafted. Our author observes that the pear-tree is much longer lived than the apple, and ought never to be planted in the same ground. He concludes with the following general observation: 'Thus, considering fruit-trees as a crop in husbandry, the general management appears to be this; plant upon a recently broken up worn out sward. Keep the soil under a state of arable management, until the trees be well grown; then lay it down to grass, and let it remain in sward until the trees be removed, and their roots be decayed; when it will again require a course of arable management.'

Of cherries and filberts.—In Kent they prefer for this fruit a situation where there is a deep surface of loam upon the rock. But by some it is said that there is not any necessity for a great depth of soil. In respect to distance apart, cherry-trees require to be planted according to their sorts; a heart requiring double the distance of a duke or morello. But, when planted by themselves, they are generally placed from twenty to thirty feet distant, and are put somewhat deeper in the earth than apples; but in other respects the management is the same.

Cherry wine.—A cooling and pleasant drink is made from the juice of cherries when properly fermented. For making this liquor the cherries should hang upon the trees till they are thoroughly ripe, in order that their juices may be better perfected and enriched by the sun; and they should be gathered in dry weather. The juice is then pressed out, and a quantity of sugar proportioned to the intended strength of the wine is to be added, and the whole regularly fermented. When the wine is become fine it must be bottled for use.

Filberts are much cultivated in some parts of Kent. The soil best adapted for them is the stone shattery sandy loam of a quality somewhat inferior; as it is a disadvantage for the trees to grow with great luxuriance, they bearing most nuts when but moderately strong. If they are planted among hops, without apples or cherries, they are put about twelve feet apart; when the

hops are dug up, the filbert plantation is kept clean by repeated digging and hoeing; and great skill is necessary in pruning to make them bear well. It is indeed entirely owing to skill and management in this operation that the trees are rendered productive upon even a favorite soil. These trees are generally trained in the shape of a punch bowl, and never suffered to grow above five or six feet high, with short stems, like a gooseberry bush, and exceedingly thin of wood. If suffered to stand till ripe this fruit will keep good for several years in a dry room or closet; but when gathered they should be laid thin on the floor of a room where the sun can get in to dry them properly.

Of raising trees for timber and other purposes.

—The importance and value of these is so well known that it is almost superfluous to say any thing on that subject: notwithstanding this acknowledged value, however, the growth of timber is so slow, and the returns for planting so distant, that it is generally supposed for a long time to be a positive loss, or at least to be attended with no profit. This matter, however, when properly considered, will appear in another light. There are four distinct species of woodlands, viz. woods, timber groves, coppices, and woody wastes. The woods are a collection of timber trees and underwood; and the coppices are collections of underwood alone. All these turn out to advantage sooner or later, according to the quick or slow growth of the trees, and the situation of the place with respect to certain local advantages. Thus in some places underwood is of great consequence, for rails, hoops, stakes, fuel, &c.; and by reason of its growth it may be accounted the most profitable of all plantations. An osier-bed will yield a return of profit the second or third year, and a coppice in fifteen or twenty years; while a plantation of oaks will not arrive at perfection in less than a century. This last period is so long that it may be supposed likely to deter people from making such plantations of this kind, as few are willing to take any trouble for what they are never to see in perfection. It must be remembered, however, that, though the trees themselves do not come to perfection in a shorter time, the value of the ground will always increase in proportion to their age. Mr. Pavier, in the Bath Papers, vol. iv., computes the value of fifty acres of oak timber in 100 years to be £12,100, which is nearly fifty shillings annually per acre; and, as this is continually accumulating without any of that expense or risk to which annual crops are subject, planting of timber may be accounted one of the most profitable articles in husbandry. Evelyn calculates the profit of 1000 acres of oak land in 150 years, at no less than £670,000. But it would be improper to occupy with timber of such slow growth the grounds which, either in grass or corn, can repay the trouble of cultivation with a good annual crop.

In the Bath papers, vol. iv., Mr. Wagstaffe recommends planting as an auxiliary to cultivation. He brings an instance of the success of Sir William Jerringham, who made trial of the most unpromising ground perhaps that any successful planter has hitherto attempted. His

method was to plant beech trees at proper distances among Scotch firs, upon otherwise barren heaths. 'These trees,' says Mr. Wagstaffe, 'in a soil perhaps without clay or loam, with the heathy soil trenched into its broken strata of sand or gravel, under the protection of the firs, have laid hold, though slowly, of the soil; and, accelerated by the superior growth of the firs, have proportionally risen, until they wanted an enlargement of space for growth when the firs were cut down.' He adds that, when the firs are felled, their roots decay in the ground; and thus furnish by that decay a new support to the soil on which the beeches grow; whereby the latter receive an additional vigor, as well as an enlargement of space and freer air; the firs themselves, though cut down before they arrived at their full growth, being also applicable to many valuable purposes.

In the *Annals of Agriculture*, vol. vi., we find the culture of trees recommended by Mr. Harries; and he informs us that the larch is the quickest grower and the most valuable of all the resinous timber trees; but, unless there be pretty good room allowed for the branches to stretch out on the lower part of the trunk, it will not arrive at any considerable size; and this observation, he says, holds good of all pyramidal trees. Scotch firs may be planted between them, and pulled out after they begin to obstruct the growth of the larch. Some of these larches he had seen planted about thirty years before, which, at five feet distance from the ground, measured from four feet to five feet six inches in circumference. The most barren grounds, he says, would answer for these trees, but better soil is required for the oaks. In this paper he takes notice of the leaves of one of his plantations of oaks having been almost entirely destroyed by insects; in consequence of which they did not increase in bulk as usual; but another, which had nearly escaped these ravages, increased at an average one inch in circumference. 'A tree four feet round,' says he, 'that has timber twenty feet in length, gains by this growth a solid foot of timber annually, worth one shilling at least, and pays five per cent. for standing. It increases more as the tree gets from five to six feet round. I have in my groves 3000 oaks that pay me one shilling each per annum, or £150 a year. My poplars have gained in circumference nearly two inches, and a Worcester and witch elm as much. I have lately been informed that the smooth cut of a holly tree, that measures twenty inches and upwards round, is worth to the cabinet makers 2s. 6d. per foot.'

The following table shows the increase of trees in twenty-one years from their first planting. It was taken from the marquis of Lansdowne's plantation, begun in 1765, and the calculation made on the 15th of July 1768. It is about six acres in extent, the soil partly a swampy meadow upon a gravelly bottom. The measures were taken at five feet above the ground; the small firs having been occasionally drawn for posts and rails, as well as rafters for cottages; and, when peeled of the bark, will stand well for seven years.

	Height in Feet.	Circumference in	
		Feet.	Inch.
Lombardy poplar	60 to 80	4	8
Arbeal . .	50 to 70	4	6
Plane . .	50 to 60	3	6
Acacia . .	50 to 60	2	4
Elm . .	40 to 60	3	6
Chestnut . .	30 to 50	2	9
Weymouth pines	30 to 50	2	5
Cluster ditto	30 to 50	2	5
Scotch fir . .	30 to 50	2	10
Spruce ditto	30 to 50	2	2
Larch . .	50 to 60	3	10

From this table it appears that planting of timber trees, where the return can be waited for during the space of twenty years, will undoubtedly repay the original profits of planting, as well as the interest of the money laid out; which is the better worth the attention of a proprietor of land, that the ground on which they grow may be supposed good for very little else. From a comparative table of the growth of oak, ash, and elm timber, given in the *Annals of Agriculture*, vol. ii., it appears that the oak is by much the slowest grower of the three.

With respect to the growth of underwood, which in some cases is very valuable, it is to be remarked that, to have an annual fall of it, the whole quantity of ground, whatever its extent may be, ought to be divided into annual sowings. The exact number of sowings must be regulated by the uses to which it is intended to be put. Thus, if, as in Surrey, stakes, edders, and hoops are saleable, there ought to be eight or ten annual sowings; or if, as in Kent, hop poles are demanded, fourteen or fifteen will be required; and if, as in Yorkshire, rails be wanted, or, as in Gloucestershire, cordwood be most marketable, eighteen or twenty sowings will be necessary to produce a succession of annual falls. Thus the business, by being divided, will be rendered less burdensome; a certain proportion being every year to be done, a regular set of hands will, in proper season, be employed; and, by beginning upon a small scale, the errors of the first year will be corrected in the practice of the second, and those of the second in that of the third. The produce of the intervals will fall into regular course; and, when the whole is completed, the falls will follow each other in regular succession. The greatest objection to this method of sowing woodlands is the extraordinary trouble in fencing; but this objection does not hold if the sowings lie at a distance from one another; on the contrary, if they lie together, or in plots, the entire plot may be enclosed at once; and, if it contain a number of sowings, some subdivisions will be necessary, and the annual sowing of these subdivisions may be fenced off with hurdles, or some other temporary contrivance; but, if the adjoining land be kept under the plough, little temporary fencing will be necessary. But, in raising a woodland from seeds, it is not only necessary to defend the young plants against cattle and sheep,

but against hares and rabbits; so that a close fence of some kind is absolutely necessary.

With regard to the preparation of the ground for raising timber, if the soil be of a stiff clayey nature, it should receive a whole year's fallow; if light, a crop of turnips may be taken; but at all events it must be made perfectly clean before the tree seeds be sown, particularly from perennial root weeds; as, after the seeds are sown, the opportunity of performing this necessary business is in a great measure lost. If the situation be moist, the soil should be gathered into wide lands, sufficiently round to let the water run off from the surface, but not high. The time of sowing is either October or March; and the method as follows:—"The land being in fine order, and the season favorable, the whole should be sown with corn or pulse adapted to the season of sowing; if in autumn, wheat or rye may be the crop; but if in spring, beans or oats. Whichever of these species be adopted, the quantity of seed ought to be less than usual, to give a free admission of air, and prevent the crop from lodging. The sowing of the grain being completed, that of the tree seeds must be immediately set about. These are to be put in drills across the land; acorns and nuts should be dibbled in, but keys and berries scattered in trenches or drills drawn with the corner of a hoe, as gardeners sow their pease. The distance might be a quarter of a statute rod, or four feet and one inch and a half. A land chain should be used in setting out the drills, as not being liable to be lengthened or shortened by the weather. It is readily divided into rods; and the quarters may be easily marked."

The species of underwood to be sown must be determined by the consumption of it in the neighbourhood. Thus, if stakes, hoops, &c., be in request, the oak, hazel, and ash, are esteemed as underwood. Where charcoal is wanted for iron forges, beech is the prevailing underwood. The oak, box, birch, &c., are all in request in different countries, and the choice must be determined by the prevailing demand. As the keys of the ash sometimes lie two or even three years in the ground, it will be proper to have the places where they are sown distinguished by some particular marks, to prevent them from being disturbed by the plough after harvest; as a few beans may be scattered along with them, if the crop be oats; or oats if the crop be beans. The crop should be reaped, not mown, at harvest time, and be carried off as fast as possible. Between harvest and winter a pair of furrows should be laid back to back in the middle of each interval, for meliorating the next year's crop, and laying the seedling plants dry; while the stubble of the unploughed ground on each side of the drills will keep them warm during the winter. The next year's crop may be potatoes, cabbages, turnips; or, if the first was corn, this may be beans; if the first was beans, this may be wheat drilled. In the spring of the third year the drills which rose the first year must be looked over, and the vacancies filled up from those parts which are thickest; but the drills of the ash should be let alone till the fourth year. The whole should afterwards be

looked over from time to time; and this, with cultivating the intervals, and keeping the drills free from weeds, will be all that is necessary until the tops of the plants begin to appear. The crops may be continued for several years; and, if they only pay for the expenses, they will still be of considerable advantage, by keeping the ground stirred, and preserving the plants from hares and rabbits. Even after the crops are discontinued, the ground ought still to be stirred, alternately throwing the mould to the roots of the plants, and gathering it into a ridge in the middle of the interval. The best method of doing this is to split the ground at the approach of winter, to throw it up to the trees on both sides; this will preserve the roots from frost; gather it again in the spring, which will check the weeds, and give a fresh supply of air; split again at midsummer, to preserve the plants from drought; gather, if necessary, in autumn, and split as before at the approach of winter. The spring and midsummer ploughings should be continued as long as a plough can pass between the plants.

Whenever the oaks intended for timber are in danger of being drawn up too slender for their height, it will be necessary to cut off all the rest at the height of about a hand-breadth above the ground; and those designed to stand must now be planted at about two rods distant from each other, and as nearly a quincunx as possible. The second cutting must be determined by the demand for the underwood; with this proviso, that the timber stands be not too much crowded by it; for, rather than this should be the case, the coppice should be cut, though the wood may not have reached its proper profitable state. What is here said of the method of rearing oak trees in woods is in a great measure applicable to that of raising other trees in timber groves. The species most usually raised in these are the ash, elm, beech, larch, spruce fir, Weymouth pine, poplar, willow, alder, chestnut, walnut, and cherry. The three last are used as substitutes for the oak and beech, and these two for the mahogany.

PART V.

OF THE MANAGEMENT OF LIVE STOCK.

As great part of the stock of a husbandman must always consist of cattle, and one of his principal expenses is in the maintenance of them, this part of his business is certainly to be looked upon as important. The cattle belonging to a farm may be divided into two classes, viz. such as are intended for work, and such as are designed for sale. The former are now principally horses. In the second volume of *Bath Papers*, we have an account of a comparative experiment of the utility of horses and oxen in husbandry, by Mr. Kedington of Bury, in which the preference is decisively given to oxen. He says that when he began the experiment, in 1779, he was almost certain that there was not an ox worked in the whole country: finding, however, the expense of horses very great, he purchased a single pair of oxen, but found much difficulty in breaking them, as the workmen were so much

prejudiced against them, that they would not take the proper pains. At last he met with a laborer who undertook the task; and the oxen 'soon became as tractable and as handy, both at ploughing and carting, as any horses.' On this he determined to part with all his cart horses; and when he wrote his letter (1781) he had not a single horse, nor more than six oxen; which inconsiderable number performed, with ease, all the work of his farm (consisting of upwards of 100 acres of arable land and sixty of pasture and wood), besides the statute duty on the highways, timber and corn, carting, harrowing, rolling, and every part of rural business. They are constantly shod; their harness is the same as that of horses (excepting the necessary alterations for difference of size and shape); they are driven with bridles and bits in their mouths, answering to the same words of the ploughman and carter as horses will do. A single man holds the plough, and drives a pair of oxen with reins: and our author informs us that they will plough an acre of ground in less than eight hours, or even in seven. The intervals of a small plantation, in which the trees are set in rows ten feet asunder, are ploughed by a single ox with a light plough, and he is driven by the man who holds it. The oxen go in a cart either single, or one, two, or three, according to the load. Four oxen will draw eighty bushels of barley or oats in a waggon with ease; and, if good of their kind, will travel as fast as horses with the same load. One ox will draw forty bushels in a light cart, which our author thinks is the best carriage of any. On the whole, he prefers oxen to horses for the following reasons:—1. They are kept at much less expense, never eating meal or corn of any kind. In winter they are fed with straw, turnips, carrots, or cabbages: or, instead of the three last, they have each a peck of bran per day while kept constantly at work. In spring they eat hay; and, if working harder than usual in seed-time, they have also bran. When the vetches are fit for mowing, they get them only in the stable. After the day's work in summer they have a small bundle of hay, and stand in the stable till they cool; after which they are turned into the pasture. Our author is of opinion that an ox may be maintained in condition for the same constant work as a horse for at least £4 less annually. 2. After a horse is seven years old, his value declines every year; and when lame, blind, or very old, he is scarcely worth any thing: but an ox in any of these situations may be fatted, and sold for even more than the first purchase; and will always be fat sooner after work than before. 3. Oxen are less liable to diseases than horses. 4. Horses are often liable to be spoiled by servants riding them without their master's knowledge, which is not the case with oxen. 5. A general use of oxen would make beef plentiful, and consequently all other meat; which would be a national benefit.

Mr. Marshal, in his *Rural Economy* of the Midland Counties, also shows the advantage of employing oxen in preference to horses, from the mere article of expense, which, according to his calculation, is enormous on the part of the horses.

He begins with estimating the number of square miles in England; and this he supposes to be 30,000 of cultivated ground. Supposing the work of husbandry to be done by horses only, and each square mile to employ twenty horses, which is about three to 100 acres, the whole number used throughout Britain would be 600,000; from which deducting one-sixth, for the number of oxen now employed, the number will be 500,000. Admitting that each horse works ten years, the number of farm-horses which die annually are 50,000; each of which requires full four years keep before he is fit for work. Horses indeed are broken in at three, some at two years old, but they are, or ought to be, indulged in keep and work till they are six; so that the cost of rearing and keeping may be laid at full four ordinary years. For all this consumption of vegetable produce he returns the community not a single article of food, clothing, or commerce; even his skin, for economical purposes, being barely worth the taking off. By working horses in husbandry, therefore, 'the community is losing annually the amount of 200,000 years keep of a growing horse; which, at the low estimate of £5 a-year, amounts to a million annually. On the contrary, supposing the business of husbandry to be done solely by cattle, and admitting that oxen may be fatted with the same expenditure of vegetable produce as that which old horses require to fit them for full work, and that, instead of 50,000 horses dying, 50,000 oxen, of only fifty-two stone each, are annually slaughtered; it is evident that a quantity of beef nearly equal to what the city of London consumes would be annually brought into the market; or 100,000 additional inhabitants might be supplied with one pound of animal food a-day each, without consuming one additional blade of grass.' 'Oxen,' adds Mr. Marshal, 'appear to be perfectly handy, and work, either at plough or cart, in a manner which shows that although horses may be in some cases convenient, and in most cases pleasurable to the driver, they are by no means necessary to husbandry. A convenience used in this country is a moveable harness-house, with a sledge bottom, which is drawn from place to place as occasion may require. Thus no labor is lost either by the oxen or their drivers. In Yorkshire oxen are still used, though in fewer numbers than formerly. The Yorkshire plough was formerly of such an unwieldy construction that four or six oxen, in yokes, led by two horses, were absolutely requisite to draw it; but the improvements in the construction of the plough have of late been so great that two horses are now sufficient for the purpose; so that, as Yorkshire has always been famous for its breed of horses, we are not to wonder at the present disuse of oxen.' For these and other reasons, the employment of oxen at all is to Mr. Marshal a convincing argument of their utility as beasts of draught. The timber carriers still continue to use them, even though their employment be solely upon the road. They find them not only able to stand working every day, but to bear long hours better than horses going in the same pasture. An ox in a good pasture soon fills his belly, and lies down to rest; but a horse can scarcely satisfy

his hunger in a short summer's night. Oxen are also much superior at a difficult pull to horses. Horses of draught cost, at four years old, from £20 to £30; they will, with extravagant keep, extraordinary care and attendance, and much good luck, continue to labor eight or ten years, and may then generally be sold for 5s. a-head. If we had no other species of animals adapted to the purposes of draught in the island, cart-horses would be very valuable. But it is evident that, were only a small share of the attention paid to the breeding of draught oxen which is now bestowed on the breeding of cart-horses, animals equally powerful, more active, less costly, equally adapted to the purposes of husbandry if harnessed with equal judgment, less expensive in keep and attendance, much more durable, and infinitely more valuable after they have finished their labors, might be produced. A steer, like a colt, ought to be familiarised to harness at two or three years old, but should never be subjected to hard labor until he be five years old; from which age, until he be fifteen or twenty, he may be considered as in his prime as a beast of draught. 'An ox,' says Mr. Marshal, 'which I worked several years in Surrey, might, at seventeen or eighteen years of age, have challenged, for strength, agility, and sagacity, the best bred cart-horse in the kingdom.'

Of horses, and the methods of breeding, rearing, and feeding them.—The midland counties of England have for some time been celebrated on account of their breed of the black cart-horse; though Mr. Marshal is of opinion that this kind are unprofitable as beasts of draught in husbandry. The present improvement in the breed took its rise from six Zealand mares sent over by the late lord Chesterfield during his embassy at the Hague. These mares being lodged at his lordship's seat at Bretby in Derbyshire, the breed of horses thus became improved in that county, and for some time it took the lead for the species of these animals. As the improved breed passed into Leicestershire, however, through some unknown circumstances, it became still more improved; and Leicester has for some time taken the lead. It is now found, however, that the very large horses formerly bred in this district are much less useful than such as are of a smaller size. Mr. Marshal describes in lofty terms one of these large horses, a stallion belonging to Mr. Bakewell, which, he says, was the handsomest horse he ever saw. 'He was,' says he, 'the fancied war-horse of the German painters; who, in the luxuriance of imagination, never perhaps excelled the natural grandeur of this horse. A man of moderate size seemed to shrink behind his fore end, which rose so perfectly upright, that his ears stood (as Mr. Bakewell says every horse's ears ought to stand) perpendicularly over his fore feet. It may be said, with little latitude, that in grandeur and symmetry of form, viewed as a picturable object, he exceeded as far the horse which this superior breeder had the honor of showing to his majesty, and which was afterwards shown publicly at London, as that horse does the meanest of the breed.' A more useful horse, bred also by Mr. Bakewell, however, is described as having 'a thick carcase, his back

short and straight, and his legs short and clean: as strong as an ox, yet active as a poney; equally suitable for a cart or a lighter carriage.'

The stallions in this country are bred either by farmers or by persons whose business it is to breed them, and who therefore have the name of breeders. See EQUUS and HORSE. These last either cover with them, or let them out to others for the season, or sell them. The prices given for them are from fifty to 200 guineas by purchase; from forty to eighty or 100 by the season; or from half a guinea to two guineas by the mare. Mr. Marshal owns that this breed of horses are a profitable species of live stock, and, as far as there is a market for six-years-old-horses of this breed, it is profitable to agriculture. 'But,' says he, 'viewing agriculture in general, not one occupier in ten can partake of the profit; and, being kept in agriculture after they have reached that profitable age, they become indisputably one of its heaviest burdens. Even the brood-mare, after they have passed that age, may, unless they be of a very superior quality, be deemed unprofitable to the farmer.'

Mr. Marshal complains that the ancient breed of Norfolk horses is almost entirely worn out. They were small, brown muzzled, and light boned, but they could endure very heavy work, with little food: two of them were quite equal to the plough in the soil of that county, which is not deep. The present breed is produced by a cross with a large one of Lincolnshire and Leicestershire already mentioned. He approves of the Suffolk breed, which, he says, are a 'half-horse, half-hog race of animals, but better adapted to the Norfolk husbandry than the Leicestershire breed;' their principal fault, in his opinion, is a flatness of the rib. In the Vale of Gloucester most farmers rear their own plough horses. They are of a very useful kind, the color mostly black, inclinable to tan color, short and thick in the barrel, and low on their legs. The price of a six-year-old horse from £25 to £35. Some cart horses are bred in Cotswold hills; the mares are worked till the time of foaling, but not while they suckle; and the foals are weaned early, while there is plenty of grain upon the ground. Yorkshire, which has been long celebrated for its breed of horses, still stands foremost in that respect among the English counties. It is chiefly remarkable for the breed of saddle horses, which cannot be reared in Norfolk, though many attempts have been made for that purpose. Yorkshire stallions are often sent into Norfolk; but, though the foals may be handsome when young, they lose their beauty when old. In Yorkshire, on the other hand, though the foal be ever so unpromising, it acquires beauty, strength, and activity as it grows up. Mr. Marshal supposes that from 5000 to 10,000 horses are annually bred up between the eastern Morelands and the Humber. In the breeding of horses he complains greatly of the negligence of the Yorkshire people, the mares being almost totally neglected; though in the brute creation almost every thing depends upon the female. With regard to the general maintenance of horses, our author recommends the Norfolk management of horses as the cheapest method of feeding them practised any where. In winter, when little

work is to be done, their only rack-meat is barley-straw; a reserve of clover-hay being usually made against the hurry of seed-time. A bushel of corn in the most busy season is computed to be an ample allowance for each horse, and in more leisure times a much less quantity suffices. Oats and sometimes barley, when the latter is cheap and unsaleable, are given; but in this case the barley is generally malted, i. e. steeped and afterwards spread abroad for a few days, until it begin to vegetate, when it is given to the horses, and is supposed to be less heating than in its natural state. Chaff is universally mixed with horse corn; the great quantities of corn grown in this country afford in general a sufficiency of *natural* chaff; the chaff, or rather the awns of barley, which in some places are thrown as useless to the dunghill, are here in good esteem as provender. This method of keeping horses, which Mr. Marshal approves of in the Norfolk farmers, is practised, and probably has been so from time immemorial, in many places of the north of Scotland; and is found abundantly sufficient to enable them to go through the labor required. In summer they are in Norfolk kept out all night, generally in clover leys; and in summer their keep is generally clover only, a few tares excepted.

In the *Annals of Agriculture*, vol. iv., Mr. Young gives an account of the expenses of keeping horses; which, notwithstanding the vast numbers kept in the island, seem still to be very indeterminate, as the informations he received varied no less than on his own farm of the expense of horses kept from £8 to £25 a year. From accounts kept for no other purpose than that of agriculture he stated the average of the whole at £11 12s. 3d. On the discordant accounts he received, Mr. Young observes that many of the extra expenses depend on the extravagance of the servants; while some of the apparent savings depend either on their carelessness, or stealing provender from their beasts privately. He concludes, however, that 'the more exactly the expense of horses is examined into, the more advantageous will the use of oxen be found.' Every day's experience convinces me more and more of this. If horses kept for use alone, and not for show, have proved thus expensive to me, what must be the expense to those farmers who make their fat sleek teams an object of vanity? It is easier conceived than calculated.

Notwithstanding all these strong arguments, urged by Mr. Young, Mr. Henry Harper, an eminent Lancashire farmer, in a comparative view of the expense of the purchase and keep of three horses and three oxen for one year, makes a balance of £44 0s. 6d. in favor of horses. But in the calculation he states 49s. per week, or £127 8s. a year, for gain by his horse team.

The Suffolk punch is a very useful animal for labor, according to Culley. 'Their color is mostly yellowish or sorrel, with a white ratch or blaze on their faces; the head large, ears wide, muzzle coarse, fore-end low, back long but very straight, sides flat, shoulders too far forward, hind quarters middling but rather high about the hips, legs round and short in the pasterns, deep-

bellied and full in the flank. Here, perhaps, lies much of the merit of these horses; for we know, from observation and experience, that all deep-bellied horses carry their food long, and consequently are enabled to stand longer and harder days' works. However, certain it is that these horses do perform surprising days' works. It is well known that the Suffolk and Norfolk farmers plough more land in a day than any other people in the island; and these are the kind of horses every where used in those districts.'—*Culley on Live Stock*, p. 27.

Another horse in high repute for labor with the farmers in Scotland, and the north of England, is the Clydesdale: it is probably equal, says Mr. Cleghorn, to any other breed in Britain.

Of the breeding and rearing of cattle.—These are reared for two different purposes, viz. for work, and for slaughter. For the former purpose Mr. Marshal remarks that it is necessary to procure a breed without horns. This he thinks would be no disadvantage, as horn, though formerly an article of some request, is now of very little value. The horns are useless to cattle in their domestic state, though nature has bestowed them upon them as weapons of defence in their wild state; and our author is of opinion that it would be quite practicable to produce a hornless breed of black cattle as well as of sheep, which last has been done by attention and perseverance; and there are now many hornless breeds of sheep in Britain. Nay, he insists that there are already three or four breeds of hornless cattle in the island; and that there are many kinds of which numbers of individuals are hornless, and from these, by proper care and attention a breed might be formed. The first step is to select females; and, having observed their imperfections, to endeavour to correct them by a well chosen male.

The other properties of a perfect breed of black cattle for the purposes of the dairy as well as others, according to Mr. Marshal, are as follows:—1. The head small and clean, to lessen the quantity of offal. 2. The neck thin and clean, to lighten the fore end as well as to lessen the collar and make it sit close and easy to the animal in work. 3. The carcass large, the chest deep, and the bosom broad, with the ribs standing out full from the spine; to give strength of frame and constitution, and to admit of the intestines being lodged within the ribs. 4. The shoulders should be light of bone, and rounded off at the lower point, that the collar may be easy, but broad to give strength; and well covered with flesh for the greater ease of draught, as well as to furnish a desired point in fattening cattle. 5. The back ought to be wide and level throughout; the quarters long; the thighs thin, and standing narrow at the round bone; the udder large when full, but thin and loose when empty, to hold the greater quantity of milk; with large dug veins to fill it, and long elastic teats for drawing it off with greater ease. 6. The legs, below the knee and hock, straight, and of a middle length; their bones, in general, light and clean from fleshiness, but with the joints and sinews of a moderate size, for the purposes of strength and activity. 7. The flesh ought to be

mellow in the state of fleshiness, and firm in the state of fatness. 8. The hide mellow and of a middle thickness.

As the milk of cows is an article of great importance, it is an object to the husbandman, if possible, to prevent the waste of that useful fluid which in the common way of rearing calves is unavoidable. A method of bringing up these young animals at less expense is proposed by the duke of Northumberland. His plan is to make skimmed milk answer the purpose of that which is newly drawn from the teat; and which, he supposes, might answer the purpose at one-third of the expense of new milk. The articles to be added to the skimmed milk are treacle and the common linseed oil cake, ground very fine, and almost to an impalpable powder: the quantities of each being so small that to make thirty-two gallons would cost only sixpence, besides the skimmed milk. It mixes very readily, and almost intimately, with the milk, making it more rich and mucilaginous, without giving it any disagreeable taste. The recipe for making it is as follows:—Take one gallon of skimmed milk, and to about a pint of it add half an ounce of treacle, stirring it until it is well mixed; then take one ounce of linseed oil cake finely pulverised, and with the hand let it fall gradually in very small quantities into the milk, stirring it in the mean time with a spoon or ladle until it be thoroughly incorporated; then let the mixture be put into the other part of the milk, and the whole be made nearly as warm as new milk when it is first taken from the cow, and in that state it is fit for use. The quantity of the oil-cake powder may be increased as occasion requires, and as the calf becomes inured to its flavor.

On this subject Mr. Young remarks that, in rearing calves, there are two objects of great importance. 1. To bring them up without any milk at all; and, 2. To make skimmed milk answer the purpose of such as is newly milked or sucked from the cow. In consequence of premiums offered by the London Society, many attempts have been made to accomplish these desirable purposes; and Mr. Budel, of Wanborough in Surrey, was rewarded for an account of his method. This was to give the calves a gruel made of ground barley and oats. But Mr. Young, who tried this method with two calves, assures us that both of them died. When in Ireland he had an opportunity of purchasing calves at three days old from 1s. 8d. to 3s. each; by which he was led to repeat the experiment many times over. This he did in different ways, having collected various recipes. In consequence of these he tried hay tea, bean meal mixed with wheat flour, barley and oats ground nearly but not exactly in Mr. Budel's method; but the principal one was flax seed boiled into a jelly, and mixed with warm water: this being recommended more than all the rest. The result of all these trials was that, out of thirty calves, only three or four were reared; these few were brought up with barley and oatmeal, and a very small quantity of flax seed jelly: one only excepted, which at the desire of his coachman was brought up on a mixture of two-thirds of

skimmed milk and one-third of water, with a small addition of flax seed jelly well dissolved. The second object, namely, that of improving skimmed milk, according to the plan of the duke of Northumberland, seems to be the more practicable of the two. Mr. Young informs us that it has answered well with him for two seasons; and two farmers to whom he communicated it gave likewise a favorable report.

In vol. iii. of the same work we are informed that the Cornwall farmers use the following method in rearing their calves:—‘They are taken from the cow from the fourth to the sixth day; after which they have raw milk from six to ten or fourteen days. After this they feed them with scalded skimmed milk and gruel made of shelled oats, from three quarts to four being given in the morning, and the same in the evening. The common family broth is thought to be better than the gruel. The proportion of gruel o broth is about one-third of the milk given them. A little fine hay is set before them, which they soon begin to eat.’

In vol. v. of Bath Papers, we have an account by Mr. Crook of a remarkably successful experiment in rearing calves without milk at all. This gentleman, in 1787, weaned seventeen calves; in 1788, twenty-three; and in 1789 fifteen. In 1787 he bought three sacks of linseed, value £2 5s. which lasted the whole three years. One quart of it was put to six-quarts of water; which, by boiling ten minutes, was reduced to a jelly; the calves were fed with this mixed with a small quantity of tea made by steeping the best hay in boiling water. By the use of this food three times a day, he says that his calves thrived better than those of his neighbours which were reared with milk.—These unnatural kinds of food, however, are in many cases apt to produce a looseness, which in the end proves fatal to the calves. In Cornwall they remedy this sometimes by giving acorns as an astringent; sometimes by a cordial of which opium is the basis. In Norfolk the calves are reared with milk and turnips; sometimes with oats and bran mixed among the latter. Winter calves are allowed more milk than summer ones; but they are universally allowed new milk, or even to suck.

According to Parkinson there seem to be two distinct kinds of Welsh cattle. ‘The large sort are of a brown color, with some white on the rump and shoulders, denoting a cross from the long horns, though in shape not the least resembling them. They are long in the legs, stand high according to their weight, are thin in the thigh, and rather narrow in the chine; their horns are white and turned upwards; they are light in flesh, and, next to the Devons, well formed for the yoke; have very good hoofs, and walk light and nimble. The other sort is much more valuable; color black, with very little white; of a good useful form, short in the leg, with round deep bodies; the hide is rather thin, with short hair; they have a likely look and a good eye; and the bones though not very small, are neither large nor clumsy; and the cows are considered good milkers.’ (Parkinson on Live Stock, vol. i. 135).

Alderney cattle are much prized in England for the sake of their milk, which is rich, and not always small in quantity. The race is considered by competent judges as too delicate and tender to be propagated to any extent in Britain. Their color is mostly yellow, light red, or dark dun, with white or mottled faces; they have short horns, are small in size, and often ill shaped; yet are they fine in bone; and their beef, though high colored, is well flavored. Mr. Culley says he has seen some very useful cattle bred from a cross between an Alderney cow and a short horned bull. See Bos.

'Whatever be the breed,' says Mr. Culley, 'I presume that, to arrive at excellence, there is one form or shape essential to all, which form I shall attempt to give in the following description of a bull.

'The head of the bull should be rather long, and muzzle fine; his eyes lively and prominent; his ears long and thin; his horns white; his neck rising with a gentle curve from the shoulders, and small and fine where it joins the head; his shoulders moderately broad at the top, joining full to his chine and chest backwards, and to the neck-vane forwards; his bosom open; breast broad, and projecting well before his legs; his arms or fore thighs muscular, and tapering to his knee; his legs straight, clean, and very fine boned; his chine and chest so full as to leave no hollow behind the shoulders; the plates strong to keep his belly from sinking below the level of his breast; his back or loin broad, straight, and flat; his ribs rising above one another, in such a manner that the last rib shall be rather the highest, leaving only a small space to the hips or hooks, the whole forming a round or barrel-like carcase; his hips should be wide placed, round or globular, and a little higher than the back; the quarters (from the hip to the rump) long, and, instead of being square, as recommended by some, they should taper gradually from the hips backward, and the turls or pott-bones not in the least protuberant; rumps close to the tail; the tail broad, well haired, and set on so high as to be in the same horizontal line with his back.' (Culley on Live Stock, p. 38.)

Of sheep.—According to Culley there are fourteen different breeds of sheep in Great Britain, all of them readily distinguishable by their horns, or by being hornless, by the color of their faces and legs, and by the length and quality of their wool. Parkinson (on Live Stock, vol. i. p. 249) enumerates no fewer than thirty-seven breeds. 'Perhaps,' says the article *Agriculture*, Supplement to *Encyclopædia Britannica*, 'the most eligible mode of classification would be, to consider separately those races which are best adapted to enclosed arable land; those which occupy green hills, downs, and other tracts of moderate elevation; and, finally, such as inhabit the higher hills, and mountains. On the first description of land every sort of practicable improvement may be effected, though there the carcase has hitherto been the chief object; on the second, the carcase is smaller but the wool generally finer,—and it is probably with such sheep that the greatest improvements ought to be attempted on the

fleece; and, on the last division, the breeds are necessarily small and hardy, and, in regard to form and general properties, still almost in a state of nature. The improvement of sheep must mainly depend on the circumstances of every district, in regard to the food and shelter it affords them; and it is only where these indispensable requisites are abundantly provided by nature, or by human industry, that the most skilful management can be successful.

Culley gives, as in the case of cattle, his idea of the best general form of the male:—'His head,' he says, of the ram, 'should be fine and small, his nostrils wide and expanded, his eyes prominent, and rather bold or daring, ears thin, his collar full from his breast and shoulders, but tapering gradually all the way to where the neck and head join, which should be very fine and graceful, being perfectly free from any coarse leather hanging down; the shoulders broad and full, which must at the same time join so easy to the collar forward, and chine backward, as to leave not the least hollow in either place; the mutton upon his arm, or fore-thigh, must come quite to the knee; his legs upright, with a clean fine bone, being equally clear from superfluous skin and coarse hairy wool from the knee and hough downwards; the breast broad and well forward, which will keep his fore-legs at a proper wideness; his girth or chest full and deep, and, instead of a hollow behind the shoulders, that part by some called the fore-flank should be quite full; the back and loins broad, flat, and straight, from which the ribs must rise with a fine circular arch; his belly straight, the quarters long and full, with the mutton quite down to the hough, which should neither stand in nor out; his twist deep, wide, and full, which, with the broad breast, will keep his four legs open and upright; the whole body covered with a thin pelt, and that with fine, bright, soft wool. The nearer any breed of sheep comes up to the above description, the nearer they approach towards excellence of form.'

This kind of stock is highly advantageous to the farmer in various points of view: as supplying food and clothing, and as a means of improving the farm. See OVIS, SHEEP, and WOOL. The sheep of different counties excel in these different properties, and in some parts they have been much improved by crossing the breeds. Kent, in his Survey of Norfolk, observes, that there ought always to be some affinity or similitude between the animals which are crossed. It is, says he, a manifest incongruity to match a Norfolk and a Leicester sheep; or a Norfolk and a South Down; or any long-woolled sheep with a short-woolled; but a Leicestershire sheep may be matched, with some degree of propriety, with a Cotswold; and a South Down sheep with a Berkshire or a Herefordshire Ryland.

In the Survey of Staffordshire Mr. Pitt says, the Wiltshires crossed by a heavy ram have produced sheep, at little more than two years old, of forty pounds per quarter, and which have been sold to the butcher at £3 10s. each. The Dorsetshire breed, which are well made and compact, have often answered well, and are, in the opinion of some experienced farmers, equa-

to any other breed. The fact is, that any breed of sheep, if sound and healthy, may be enlarged and improved by good keeping, and by crossing with rams selected with attention.

The best sheep for fine wool are said to be those bred in Herefordshire and Worcestershire; but they are small and black faced, and consequently bear but a small quantity. Warwick, Leicester, Buckingham, and Northamptonshire, breed a large-boned sheep, of the best shape, and deepest wool. The marshes of Lincolnshire also breed a very large kind of sheep, but their wool is not good. The northern counties in general breed sheep with long, but hairy wool; and Wales breeds a small hardy kind of sheep, which has the best tasted flesh, but the worst wool of all. The farmer, according to some writers, should always buy his sheep from a worse land than his own, and they should be big-boned, and have long greasy wool curling close and well. These sheep always breed the finest wool, and are also the most approved of by the butcher.

Pitt, in his Survey of Staffordshire, tells us, in that populous manufacturing county the considerable demand for lamb, as well as mutton, induced a great proportion of farmers to keep none other than an annual stock of sheep, consisting of ewes bought in at Michaelmas from Cannock Heath, Sutton Coldfield, the common of Shropshire, and sometimes even from Gloucestershire, Wiltshire, and Dorsetshire. These ewes being immediately put to a ram, the lambs in spring are suckled till they are fit for the butcher; they are then sold, and the ewes kept in good pasture, fattened and sold after them, and the whole stock generally cleared off within the year: the lambs and wool generally pay the original purchase of the ewe, and sometimes more; and the price of the fat ewe remains for keeping and profit. He observes that the rams of Mr. Fowler, a celebrated breeder of this kind of stock, are stout, broad-backed, wide on the rump, and well made, with fine wool to the very breech; the largest of them would, he believes, fatten to more than thirty pounds the quarter; and the smallest would be considerably above twenty pounds. Great attention has been paid for several years past to improving this breed both in wool and carcasses. But Mr. Fowler himself thinks the breed is now pushed rather too far in bulk and weight, for the pasturage of the common, or even of the neighbourhood, unless they are driven into better land for fattening. But he is clearly of opinion that pushing or increasing the size or bulk of sheep by improving their pasturage, or removing them to a better pasture, does not at all tend to injure the staple, or degenerate the fineness of clothing wool, provided due attention be paid to selecting the finest-woolled rams. The Leicestershire breeds, he says, are of two kinds, the old and the new. The old Leicesters are large, thick, heavy sheep, with long combing wool; the new Leicester breed is a refinement upon the old, by crossing with a finer-boned and a finer-woolled ram. These are now established in various parts of Staffordshire, and increasing in other places. The old Leicester breeds are crossing with the new, which bids fair to produce a

very good breed; there being many instances in which the old breed were become too coarse, and the new too fine. The stock of Mr. Dyott, of Freeford near Litchfield, a gentleman who has attended much to this subject, is closely bred from the new Leicester breed, by rams for many years procured from the best breeds. His farming is to the extent of 800 acres or more; and the main object sheep. His stock of breeding ewes is 260, and he never sells a lamb, which upon the average rearing is about 300. He informed our author that his annual sales from sheep and wool amounted upon an average to £650, that his sheer hogs or yearling wethers generally go to the butcher at two guineas each; and the culls of this age make 35s. each; and by keeping to February he has sometimes sold them at 50s. each, under two years old. He has several times killed sheep kept to a greater age, that have weighed forty pounds per quarter.

Mr. Pitt says that there are some other flocks, such as those of lord Bagot's tenants, and particularly some lately belonging to Mr. Harvey, his lordship's steward, that deserve attention. This breed is gaining ground fast, and is supposed by many to be the best pasture sheep-flock in the kingdom. The superiority consists in this, that the pastures may be stocked much harder with these than any other stock of equal weight; as they are always fat, even when suckling lambs. The ewes, full grown, will weigh from twenty to twenty-five pounds per quarter; wethers at two years old about the same; but when kept another year they rise to thirty pounds per quarter. The fleeces weigh from seven to ten pounds. These sheep he describes to be fine and light in the bone; thick and plump in the carcass; broad across the loin, with the back bone not rising into a ridge, but sinking in a nick, and a double chine of mutton rising on either side; fine and clean in the neck and shoulder; not too short in the leg; and of a sufficient bulk in the carcass to rise to the weight above-mentioned.

In Norfolk, those who keep ewe flocks, Mr. Kent observes, find them answer extremely well; for, besides the fleece and manure, the average price of the lambs is 12s. Those who buy the wether lambs with a view of bringing them up for fattening stock, after keeping them eighteen or nineteen months, generally sell them at an average of 30s., which is a very handsome profit.

Mr. Boys informs us that the management of sheep in the different parts of Kent is as follows:—In the eastern part the flock farmers buy in lambs at Romney fair the 20th August, at from 12s. to 14s. each; and when they have kept them two years they either sell them lean to the fattening grazier, or fatten them themselves on turnips and pea or bean straw. Oats, and cullings of garden beans, are sometimes given to finish them in the spring. When these two yearling sheep are sold in autumn to the graziers, the price is from 24s. to 28s. each; and when made fat they produce from 34s. to 42s. according to their size and fatness. But these prices have lately considerably advanced. The few sheep bred in the marshes are of the same sort, except some small parcels of Dorsetshire and South Down ewes. But al-

most the whole of the sheep kept on the upland farms of East Kent are the true Romney marsh breed; whose carcasses and bones being large, and wool long and heavy, they require rich land and good keep to make them fat. Mr. Boys keeps no other than South Down sheep, and has every reason to be satisfied with them: his flock is about 1000, 400 of which are breeding ewes.

In the isle of Sheppey the sheep are of the Romney marsh sort, true Rents. The soil being much inferior to Romney marsh, the sheep are somewhat smaller; and, from the same cause, their wool is lighter and finer. The wethers are fattened at three years old, then weighing from twenty to twenty-four pounds per quarter. The sheep mostly kept in the district of West Kent are the South Down sort, bought in wether lambs at the autumnal fairs on the Downs, October 2nd. The usual practice with the lambs in the Romney marshes is that of sending them, about the beginning of September, to be kept by the neighbouring upland or hill farmers during the winter. They go in separate lots, being received at certain appointed places by the farmers, and driven to the houses or taken to the farms by their servants. They are then commonly put upon the stubbles or grattons, as they are called; but in some cases they have also pastures to run upon, though too little attention is, in general, paid to the changing of them; by which they suffer much, and are often greatly injured, especially such as are weakly and delicate. It is found that there is a prodigious benefit in keeping the lambs in winter, in such situations, in having the grounds dry and warm, instead of being of a cold, wet, clayey nature. Lambs should by no means be stocked along with the ewes, as the old sheep will constantly take the feed, and stench the land, by which the lambs may be greatly hurt. They should always be stocked separately, and the pastures be frequently changed, circumstances which are little regarded here. Some think that lambs do not thrive well on being put to grass, after having been fed on luxuriant food, such as turnips, old tares, rye-grass, &c. The price of the keeping of lambs in these cases is very different; some paying only 3s. 6d. the lamb, while others pay 5s.; and where no neat stock are kept they charge as high as from 6s. to 6s. 6d. the head, for the space of about six months. This is but a late advance; however it makes the price of keep a serious object. The loss of lambs in this system of winter management is occasionally considerable, but depends much on the nature of the season, as to mildness or severity, amounting in some cases to four or more in 100.

The tegs, or one-year old lambs, in this system are brought from the uplands, where they have been wintered too often in a low state of condition, for the supply of the marsh graziers, which enables them to keep more ewes and fattening sheep on the marsh lands. This is done about the beginning of April, when the upland farmers are indulged with a feast or treat at the expense of the graziers, as a recompense for their care and attention to the lambs, in which liberality has a great effect. As the flocks reach the marsh, they are put into the poorest pastures, at the rate of five to the acre, their old sheep being

just sold to make room for them. These are commonly the best conditioned tegs, in which there may sometimes be loss from the sudden transition from poor to too good keep, though they are not, in general, so subject to some sorts of disease as the old ones, on such changes being made in their food. The marsh sheep-graziers have lately been much in the practice of prevailing on the farmers to keep such flocks a fortnight, or even double that time, on turnips, which has the advantage of enabling them to double the stock on the same pastures during the summer; while, on the other hand, it is evident that, when they are so hard stocked early in the spring, they can neither have so luxuriant a growth nor be so full of grass. The pastures are likewise eased gradually, as the fat ewes or wethers are taken off, and their places supplied by the wether-tegs, while the ewe-tegs are suffered to remain on their original pastures until they are selected, or set for going to the rams. The wether tegs in the autumn are removed to the fattening, and the ewe-tegs to the breeding grounds, among the two and three yearling ewes. The wethers remain till July or August following, when, as they become fat, they are drawn out and sold to the butchers at the marsh markets, or sent to Smithfield. The two-yearling wethers, when fat, at this season weigh from twenty to twenty-eight pounds per quarter; and some of the largest and best fed a few pounds more. The old ewes, there called barrens, are put to fattening as soon as their milk is dried after the third lamb, which is at the age of four years, on some of the best lands; where they are placed, from two to three per acre, for the winter. These, in favorable winters, are sometimes made fat, and sold in the spring. The practice of fattening sheep on turnips, assisted by oil cake, corn, hay, saintfoin, &c., is greatly in use among the upland farmers of this county; not so much for the profit by feeding with those articles, as for the great improvement of the soil where the turnips are fed off. The manure from sheep fed on oil cake and turnips is reckoned very enriching to the land. A great number of fold flocks of lean sheep are kept by the farmers in the east part of the county, of from eight to twenty score. These are each attended by a shepherd, who removes the fold every morning to fresh ground, at six o'clock in summer, and at break of day in winter: the flock is then driven away to the most inferior keep at the first part of the morning, and is returned into the fold for two or three hours in the middle of the day, while the shepherd goes to dinner; in the afternoon it is gradually led to the best keep in the farm, that the sheep may return full fed to the fold in the evening. Great caution is necessary in feeding sheep on clover in summer, and on turnips in the first part of winter.

Mr. Robertson has inserted the following account of feeding ewes with early lambs in his Survey of Mid Lothian, as stated by an accurate observer. The number in all was sixty; fed off in four weeks the expense was £12. Thus each lamb cost 4s. The expense of twenty fed five weeks was £5 12s. 6d., or 5s. 7½d. each lamb:— 'Feeding on grass takes six weeks to feed off. The average rent of good grass may be £2 per

acre, which will feed off four ewes with lambs. He considers six weeks from the middle of April, the usual time of laying on, to be full one-half of the value of the grass for that season; hence the lambs cost 5s. each in that time. In turnip feeding sheep, by flaking them on the field, twenty sheep eat an acre in fourteen weeks. If they be led off to a grass field, ten score will tattle or dung an acre in seven days, worth £2 10s. As to feeding in the house, he finds the dung worth the trouble of carting, and the value of the straw it takes for litter. He finds also the lambs fed on grains not only sooner ready, but more white and firm in the flesh; the ewes are also in better condition. He likewise found that, at times, to mix a little salt among the grains was of great service; but it was necessary to avoid, above all things, giving them grains when sour, or old kept; and of importance also to feed them regularly, and to give them fresh clean litter every day. A sheep will consume about twenty pounds of turnips in twenty-four hours, if it be allowed as many as it can eat, which should always be allowed to fat sheep; but, as sheep vary in size, so they will consume more or less food.

The Teeswater breed of sheep is said to be the largest in Great Britain; is at present the most prevalent in the fine fertile lands on the banks of the Tees in Yorkshire; and supposed to be from the same stock as those of the Lincolns. It is a breed only calculated for warm rich pastures, where they are kept in small lots enclosed, and well supported with food in severe winters. The produce in mutton is large, but, from their requiring so much longer time and richer keep, and being admitted in so much smaller proportions on the acre, they are not, upon the whole, so profitable, perhaps, as the smaller more quick-feeding breeds. In the ewes there is, however, according to Culley, a property which is of much consequence, which is, that in general they are very prolific, bringing two and frequently three lambs, and in some cases a greater number each. He gives the following description of the breed:—The legs are longer, finer boned, and support a thicker and more firm and heavy carcase than the Lincolns; the sheep are much wider on the backs and sides, and a fatter and finer-grained mutton. The weight per quarter in two-years old wethers is from twenty-five pounds to thirty-five pounds, and in particular instances to fifty-five pounds or more. The wool is shorter and less heavy than in that breed.

In the Corrected Report of the West Riding of Yorkshire, Mr. Parkinson supposes that a useful kind is capable of being bred by crossing the ewes of this sort with Dishley rams. It is added that by the use of these, and those of the Northumberland kind, the quality of the wool and the mutton has not only been greatly improved, but the quantity of bone and offal much lessened; and, at the same time, the fattening property considerably increased: they becoming fatter at two years old than the others are at three. The wethers of this improved sort generally sell, unshorn, at two years old, from 45s. to 55s. a piece, and weigh from twenty-four to thirty pounds the quarter.

The Lincolnshire breed is characterised by their having no horns; white faces; long, thin, weak carcasses; thick, rough, white legs; bones large; pelts thick; slow feeding; mutton coarse-grained; the weight per quarter in ewes from fourteen pounds to twenty pounds; in three-year old wethers from twenty pounds to thirty pounds; the wool from ten to eighteen inches in length. And it is chiefly prevalent in the district which gives the name, and other rich grazing ones. The writer of the work on Live Stock supposes that this breed is now so generally improved by new Leicester tups, that they are probably, in a great measure, free from those defects of the old breed of which Mr. Culley, with much reason, complained, namely, slow feeding, from a looseness of form, and too much bone, and coarse-grained flesh. It must not, however, be denied, that a good old Lincoln has ever been, and the name, at least, still continues a great favorite at Smithfield. The new or improved Lincolns have finer bone, with broader loins and trussed carcasses, and are among the best, if not actually the best, long-woolled stock we have.

The New Leicester, or Dishley, is an improved breed of sheep, readily distinguished from the other long-woolled sorts, according to Culley, by having fine lively eyes; clean heads, without horns; straight, broad, flat backs; round or barrel-shaped bodies; fine small bones; thin pelts; and a disposition to make fat at an early age; to which may be added a superiority in the fineness of the grain and the flavor of the mutton to that of other sheep of the large long-woolled kinds. The weight per quarter in ewes three or four years old from eighteen pounds to twenty-six pounds; in two-year old wethers, from twenty pounds to thirty pounds; the length of wool from six to fourteen inches. The author of the Treatise on Live Stock characterises them as having a fulness of form and substantial width of carcase, with a peculiar plainness and meekness of countenance; the head long, thin, and leaning backward; the nose projecting forward; the ears somewhat long, and standing backward, great fulness of the fore-quarters; legs of moderate length, and the finest bone; tail small; fleece well covering the body, of the shortest and finest of the combing wools, the length of staple six or seven inches. The fore-flank, a term of the old school, current in the time of Lisle, or that flap of skin and fat appended to the ribs, and the inferior part of the shoulder, is remarkably capacious in this breed. New Leicester mutton, it is believed, is the most finely grained of all the large long-woolled species, but of a flavor bordering on the insipid. And it is added, that it is reported, and with the strongest probability, from the appearance of the stock, the fineness of the wool, and the grain of the mutton, that a Ryeland cross was a prime instrument in the Dishley improvement of sheep. Probably the root or foundation was Lincoln. In the ordinary and gradual course of improvement or alteration of form, it must have taken, it is thought, a long time and vast pains, to mould the animals into that artificial and peculiar shape which distinguishes this remarkable variety.

The author of the Treatise on Cattle says, the

pure Dishley sheep are by no means the most prolific, nor the best nurses; and adds that, the heads of the improvers having had time to cool, it is no longer boasted that new Leicester sheep are able to subsist, and even thrive, on the shortest commons. In fine, it is contended, the merits of this stock as an improving cross (their grand point of utility), being so undeniably great, their disadvantages have been overlooked: and, further, that though the Dishley cross has made its way into every part of this island, to the Land's End, to the bottoms of the Welsh mountains, and of the Scottish Highlands, to Ireland, and even to Russia, its general success has been attended with various particular instances of failure, a remarkable one of which is given by lord Somerville, in his *Facts*, in respect to the Bampton or Western long-woolled sheep. The cross is sometimes very injudiciously used with short or carding wool stock, excepting where the intention is only forward lamb. On stock naturally good and improvable this peculiar effect of the new Leicester cross has resulted: the improved have considerably surpassed, in the most valuable properties, their improvers. Of this many examples may be seen, it is supposed, in the improved Lincoln, Northumberland, and Midland county sheep. It has been stated by lord Somerville that all the breeds of sheep in this kingdom may be arranged into two classes; those which shear the short or clothing, and those which shear the long or combing wool. And that the quality of the flesh in each class follows the character of the wool, the short-woolled sheep being close in the grain as to flesh, consequently heavy in the scale, and high flavored as to the taste; the polled long-woolled sheep more open and loose in the grain, and larger in size. We have as above described the three chief long-woolled varieties, and must refer to our article *SHEEP* for further observations on this valuable animal and its habits.

Of the rearing and fattening of hogs.—The practice of keeping these animals is so general, especially in England, that one should think the profit attending it would be absolutely indisputable; and this the more especially when it is considered how little nicely they have in their choice of food. From such experiments, however, as have been made, the matter appears to be very doubtful. In the *Annals of Agriculture*, vol. i., we have an experiment by Mr. Mure, of feeding hogs with the cluster potatoe and carrots; by which it appeared that the profit on large hogs was much greater than on small ones; the latter eating almost as much as the former, without yielding a proportionable increase of flesh. The gain was counted by weighing the large and small ones alive; and it was found that from November 10th to January 5th they had gained in the following proportion: twenty large hogs £1 3s. 6d.; twenty small 7s. 8d.; two stag hogs, £1 17s. 8d. On being finished with pease, however, it appeared that there was not any real profit at last; for the accounts stood ultimately at par; the expense being £95, and the product being exactly the same.

In some experiments by Mr. Young, related in the same volume, he succeeded still worse, not

being able to clear his expenses. His first experiment was attended with a loss of a guinea per hog; the second with the loss of 11s. 8d.; the third of 3s. In these three the hogs were fed with pease; given whole in the two first, but ground into meal in the last. The fourth experiment, in which the hog was fed with Jerusalem artichokes, was attended with no loss; but another, in which pease were again tried, was attended with a loss of 4s. Barley was tried, ground along with pease and beans; this was attended with a profit of 17s. 4½d. In another experiment in which the hogs were fed with pease and barley ground, the beans being omitted as useless, there was a profit of 12s. 3d. upon an expense of £20 15s. 9d. In this experiment the pease and barley meal were mixed into a liquid like cream, and allowed to remain in that state for three weeks, till it became sour. This was attended in two other instances with profit, and in a third with loss: however, Mr. Young is of opinion that the practice will still be found advantageous, on account of the quantity of dung raised, and that the farmer can thus use his pease and barley at home, without carrying them to market.

Mr. Marshal remarks that, in the midland district, oats are preferred to barley as a food both for young pigs and breeding swine. It is also supposed that young pigs require warm meat to make them grow quickly. Barley meal and potatoes are used in fattening them. In this district it is common to keep two or three pigs in the sty along with the old hogs to be fatted.

In Staffordshire, Mr. Pitt says, the breed of hogs most esteemed is not the large slouched-eared breed, but a cross between them and a smaller dwarf breed. They should be fine in the bone, thick and plump in the carcase, with a fine thin hide, and of a moderate size; large enough to fat, at from one to two years old, to the weight of from 300 lbs. to 400 lbs. each. These, if well bred, will keep themselves in good plight with little feeding, and will soon grow fat with a plentiful allowance of proper food. Hogs of the large breed have been fatted there, to from 600 lbs. to 800 lbs. each, exclusive of the entrails; but, requiring much time and food, have pretty generally given way to a smaller-sized, finer-boned, thick, plump, animal. Hogs are generally fatted there by farmers with the refuse of the dairy, boiled potatoes, and barley meal, and pease either whole or ground: by millers with the husk or bran of wheat ground down, but not wholly divested of its flour; also with other sorts of grain and pulse ground down; by butchers with the refuse or offal of slaughtered animals. The best way of managing the potatoes is to boil them in their own steam, and put them afterwards into a large oven when the bread is drawn, to evaporate the watery parts: they will then go nearly as far as chestnuts or acorns in feeding.

In Lancashire Mr. Holt observes, that Mr. Eccleston has a breed between the wild boar and the Chinese, which have very light and small bellies. Upon the same food, he thinks, they will yield one-fourth more flesh than either the large

Irish or Shropshire breeds. Their size is but small, weighing only from ten to fifteen score, generally about twelve score.

In Kent a great number of pigs are reared and fed on the corn stubbles for the butchers, which are killed in autumn for roasting, at the age of three or four months, then weighing three or four score pounds each. Some are also fattened and killed at from six to twelve months old, and sold. In the west part of this district, a few farmers have the larger kind, or Berkshire breed; but in general they are mixtures of many different sorts. Little attention, says Mr. Boys, is paid to this animal, though the breed might doubtless be very much improved with proper care. Many hogs, says he, are likewise kept in the woods of the Weald of Kent in the autumn, on acorns, and fattened on corn in the winter.

Pigs, Mr. Holt says, should, during their growth, be regularly turned out to graze. This, besides the advantage of grass, which is nutritious, by the fresh air and exercise causes a disposition to take their rest; and sleep after a meal contributes to their cleanliness, and renders their flesh of superior flavor. Mr. Young has inserted a number of experiments on feeding hogs in the Transactions of the London Society of Arts; and, on the whole, prefers pollard and skimmed milk, as the best feeding; and, next to these, boiled carrots and potatoes.

Of rabbits.—In particular situations these animals may be kept to advantage, as they multiply exceedingly, and require no trouble in bringing up. A considerable number of them are kept in Norfolk, where many parts, consisting of barren hills or heaths, are proper for their reception. They delight in the sides of sandy hills, which are generally unproductive when tilled; but level ground is improper for them.

Mr. Marshal is of opinion that there are few sandy or other loose soiled hills which would not pay better in rabbit warrens than any thing else. 'The hide of a bullock,' says he, 'is not worth more than one-twentieth of his carcase; the skin of a sheep may, in full wool, be worth from a sixth to a tenth part of his carcase; but the fur of a rabbit is worth twice the whole value of the carcase; therefore, supposing a rabbit to consume a quantity of food in proportion to its carcase, it is, on this principle, a species of stock nearly three times as valuable as either cattle or sheep.' Rabbit warrens ought to be enclosed with a stone or sod wall; and, at their first stocking, it will be necessary to form burrows to them until they have time to make them for themselves. Boring the ground horizontally with a large auger is perhaps the best method that can be practised. Eagles, kites, and other birds of prey, as well as cats, weasels, and polecats, are great enemies of rabbits. The Norfolk warreners catch the birds by traps placed on the tops of stumps of trees or artificial hillocks of a conical form, on which they naturally alight. Traps also seem to be the only method of getting rid of the other enemies, though thus the rabbits themselves are in danger of being caught.

Rabbits are subject to two diseases:—1. The rot, occasioned by too much green food, or giving it to them fresh gathered, with dew or rain upon

it. The cure is the sweetest hay that can be got. 2. A kind of madness, which is known by their tumbling about, with their heels upwards. The cause is full feeding; the cure, keeping them low, and giving them tare thistle. One buck rabbit will serve nine does.

Of poultry.—Under this head are comprehended a variety of birds, which are objects of attention to the farmer. 1. *Fowls.*—The farm yard cannot be said to be complete until well stocked with fowls; the advantage of which is most considerable in situations where the farmer is best supplied with grain, and has the best means of preserving the birds. In choosing this kind of stock, prefer the best breeders and the best layers; the oldest being the best sitters, and the youngest the best layers; but no sort will be good for either, if they are kept too fat. The best age to set a hen for chickens is two years old, and the best month is February; though any month between that and Michaelmas is good. Hens sit twenty-one days, during which they should constantly have meat and drink near them, that they may not straggle from their eggs, and chill them. If fowls are fed with buck or French wheat, or with hemp seed, they will lay more eggs than ordinary; and buck-wheat, either whole or ground, made into paste, will fatten fowls very speedily; but the common food used is barley-meal, with milk or water; but wheat flour moistened is the best. A good hen should be working, vigilant, and laborious, both for herself and her chickens, and the larger the better. The elder hens are rather to be chosen for hatching than the younger, because they are more constant, and will sit out their time; but, if chosen for laying, take the youngest. Those eggs that are laid when the hens are a year and a half or two years old are the best; at that time give the hens plenty of victuals, and sometimes oats, with fenugreek to heat them, if you would have large eggs.

In setting hens, take care that the eggs be new, which may be known by their being heavy, full, and clear. While sitting, a hen should never be disturbed from her nest, lest she forsake it. A hen-house should be large and spacious, with a pretty high roof and strong walls, to keep out thieves and vermin; there should likewise be windows on the east side, for the benefit of the rising sun; and round about the inside of the walls, upon the ground, should be made large pens, three feet high, for geese, ducks, and large fowls to sit in; and near the covering of the house long perches, reaching from one side to the other, should be fixed, on which cocks, hens, capons, and turkeys, may sit. At another side of the house, at the darkest part of the ground pens, fix hampers full of straw, for nests, for the hens to lay their eggs; but, when they sit to hatch chickens, they should be on the ground; there should likewise be stakes stuck in the walls, that the poultry may climb to their perches with ease; and the floor should not be paved, but made of earth smooth and easy. The smaller fowls should also have a hole at one end of the house to go in and out when they please, else they will seek out roosts in other places. It would likewise be of great advantage to have the hen-house, si-

tuated near some kitchen, brew-house, bake-house, or kiln, where it may have the heat of the fire, and be perfumed with smoke, which is very grateful to pullets.

To fatten chickens, put them into coops, and feed them with barley-meal; put a small quantity of brick dust into their water, which will give them an appetite and fatten them very soon; for all fowls and birds have two stomachs, the one is their crop, that softens their food, and the other the gizzard, that macerates their food; in the last we always find small stones and sharp sand, which help to do that office.

2. The *duck*, a native of Great Britain, is found on the edges of all quiet waters throughout Europe. In breeding, one drake is generally put to five ducks; the duck will cover from eleven to fifteen eggs, and her term of incubation is thirty days. They begin to lay in February, are very prolific, and are apt, like the turkey, to lay abroad, and conceal their eggs, by covering them with leaves or straw. The duck generally lays by night, or early in the morning; white and light-colored ducks produce similar eggs, and the brown and dark-colored ducks those of a greenish blue color, and of the largest size. In setting ducks, it is considered safest to put light-colored eggs under light ducks, and the contrary; as there are instances of the duck turning out with her bill those eggs which were not of her natural color. During incubation, the duck requires a secret and safe place, rather than any attendance, and, will, at nature's call, cover her eggs, and seek her food, and the refreshment of the waters. On hatching, there is not often a necessity for taking away any of the brood, barring accidents; and having hatched, let the duck retain her young upon the nest her own time. On her moving with their brood, prepare a coop upon the short grass, if the weather be fine, or under a shelter, if otherwise: a wide and flat dish of water, often to be renewed, standing at hand; barley, or any meal, the first food. In rainy weather, particularly, it is useful to clip the tails of the ducklings, and the surrounding down beneath, since they are else apt to drizzle and weaken themselves. The duck should be cooped at a distance from any other. The period of her confinement to the coop depends on the weather and the strength of the ducklings. A fortnight seems the longest time necessary; and they may be sometimes permitted to enjoy the pond at the end of a week, but not for too great a length at once, least of all in cold wet weather, which will affect, and cause them to scour and appear rough and draggled. In such case they must be kept within a while, and have an allowance of bean or pea-meal mixed with their ordinary food. The meal of buck-wheat and the former is then proper. The straw beneath the duck should be often renewed, that the brood may have a dry and comfortable bed; and the mother herself be well fed with solid corn, without an ample allowance of which ducks are not to be reared or kept in perfection, although they gather so much abroad. Duck eggs are often hatched by hens. The fattening of ducks at any age is very easy; whether it be the duckling or the grown duck,

the method is the same. They are to be put in a quiet dark place, and kept in a pen, where they are to have plenty of corn and water; any kind of corn will do; and with this single direction they will fatten extremely well in fifteen or twenty days.

3. *Geese* are advantageous both for food, feathers, and grease. They will live upon commons, or any sort of pasture, and need little care and attendance; only they should have plenty of water. The largest geese are reckoned the best; but there is a sort of Spanish geese that are much better layers and breeders than the English, especially if their eggs be hatched under an English goose. Geese in general lay in spring, the earlier the better, because of their price and of their having a second brood. They commonly lay twelve or sixteen eggs each. One may know when they will lay by their carrying straw in their mouths, and when they will sit by their continuing on their nest after they have laid. A goose sits thirty days, but if the weather be fair and warm she will hatch three or four days sooner. After the goslings are hatched, some keep them in the house ten or twelve days, and feed them with curds, barley meal, bran, &c. After they have got some strength, let them out three or four hours a-day, and take them in again, till they are big enough to defend themselves. For fattening green geese, they should be shut up when they are about a month old, and they will be fat in about a month longer. The fattening of older geese is commonly done when they are about six months old, in or after harvest, when they have been in the stubble fields, from which food some kill them; but those who wish to have them very fat shut them up two or three weeks, and feed them with oats, split beans, barley meal, or ground malt mixed with milk. Geese will likewise fatten well with carrots cut small.

4. *Turkeys* prosper very well in open countries, where there is not much shelter to harbour vermin to destroy them, as they are naturally inclined to ramble. The hens are so negligent of their young, that, while they have one to follow them, they never look after the rest; and therefore care must be taken while they are young to watch them, and to keep them warm, as they cannot bear the cold. When kept with corn, they are very great feeders; but, if left to their liberty when grown up, they will get their own living, without trouble or expense, by feeding on herbs, seeds, &c. Turkeys, being very apt to straggle, will often lay their eggs in secret places; therefore they must be watched, and made to lay at home. They begin to lay in March, and sit in April; eleven or thirteen eggs are the most they sit on. They hatch in twenty-five or thirty days. The young ones may be fed either with curds, or green fresh cheese. Their drink may be new milk, or milk and water. Some give them oatmeal and milk boiled thick together, into which they put wormwood chopped small, and sometimes eggs boiled hard, and cut in pieces. They must be fed often; and, when they have got some strength, feed them abroad in a close walled place where they cannot stray; they must not be let out till the dew is off the grass, as it is very prejudicial to them. In the fattening

of turkeys, sodden barley is very excellent, or sodden oats for the first fortnight.

5. *Pigeons*.—These, Mr. Pitt observes, can hardly, in general, be considered as an article of profit to the occupier of a farm, though there are instances in Staffordshire, where something handsome is actually made of them by tenants; yet these instances are rare, and too seldom occur to be reckoned upon in a general account. But few farm-houses are indeed furnished with the necessary accommodations for them; and the increase of them beyond a certain degree must be injurious to the cultivation of grain; within due bounds they do little harm; but, increased beyond it, they prove pernicious vermin, both to the new sown crops and the early part of harvest. They are particularly voracious on early pease. Mr. Kent says that pigeons are much fewer in Norfolk than formerly, as many of the pigeon-houses have been dropt, on account of the injury which they did to thatched buildings.

Of bees.—Under the article *APIS*, we have given so full an account of the management of these useful and industrious insects, that we need add nothing here on the subject of bee husbandry.

SKETCH OF HOLKHAM FARMING.

In concluding this practical article we trust our readers will be gratified with an abstract of Dr. Rigby's able account of 'Holkham' farming; we give it not only with a view to doing justice to the efforts of the distinguished proprietor of that estate in improving and extending the scientific pursuit of agriculture, but also as containing many valuable passing hints on several of the topics of this paper. Dr. Rigby tells us that his paper was originally read at the Norwich Philosophical Society in December 1816: and written from notes taken at Holkham, not intended for publication.

'My observations,' says our author, 'will be principally directed to the extraordinary improvement Mr. Coke has effected in the value of his extensive estate, by a system of agriculture almost peculiar to himself; by an encouraging liberality to his tenants, in a system of leasing his farms, equally peculiar to himself; and by his judicious and extensive system of planting, which, I believe, already exceeds any thing of the kind in the county, and is still progressively increasing. I had the advantage of riding with Mr. Coke several hours, two successive mornings, over the Holkham farm in his own occupation, and over another at Warham, occupied by an intelligent tenant; and, as he allowed me to be full of questions, and seemed to have a ready pleasure in answering them, I had ample means of gratification and information.'

'My first impression was that of surprise and admiration at the exuberance of the crops, at the seeming richness of the soil, and at its unexampled freedom from weeds. The first crops which attracted our notice were some extensive ones, both of wheat and barley. I had never before seen such. Mr. Coke estimated the wheat from ten to twelve coombs per acre, and said nearly twenty coombs per acre of barley had grown upon it, which is at least double the average crop in the county of Norfolk, and nearly treble

that of many counties in the kingdom; and yet so sterile was this part of the estate considered, when he came into possession of it, that a large tract of it had been let, tithe free, on a long lease, at 3s. per acre; and Mr. Coke offered another lease, of twenty-one years, at 5s. per acre, but the tenant had not courage to take it, and Mr. Coke procured him a farm under another landlord. At that time wheat was not cultivated in this district: in the whole tract, between Holkham and Lynn, not an ear was to be seen, nor was it believed that one would grow. The system of farming was wretched, and the produce of the soil of little value. What a change has been effected by capital, skill, and industry! Notwithstanding the rain of that summer had been, on other farms, so productive of weeds, and had rendered crops, in general, more than usually foul, I cannot help repeating that there was scarcely a weed to be seen here. In several places the harvest had commenced, and the ground, which was exposed on cutting the wheat, was as clean as a barn floor. The day being fine, it was pleasing to see the reapers at work—they were divided into parties, who seemed to have certain quantities allotted to them to cut; among the rest I observed, with some interest, a man, and two girls about twelve or fourteen years of age, who had also a certain share; he proved to be a widower, and these were his children.

'On the second morning Mr. Coke accompanied me to an extensive farm of his at Warham, a neighbouring parish, in the occupation of Mr. Blomfield, cultivated on the Holkham system, and exhibiting the same weedless surface, and the same rich produce, as Mr. Coke's. On one piece of seventy acres, very near the sea, I think the wheat exceeded Mr. Coke's in luxuriance and quantity.

'Mr. Blomfield has the merit of having made a discovery, and adopted a practice, which must be of singular benefit to Norfolk. This county is deficient in old pasture, and the attempt to lay down land, as it is called, for a permanence, so as to procure this kind of valuable pasture, has hitherto been attended with great expense, and has not always been successful. He effects it by what he has, rather ludicrously, called inoculating the land, and literally in one summer it produces a rich, and, strange as it may sound, an old pasture. Without describing the process in detail, it will give a sufficient idea of it to say that the immediate operation on the land consists in placing pieces of grass, turf, or flag, of about three inches and a half square, at certain distances, leaving an interval uncovered equal to that which is covered by the pieces of flag: these are well rammed down, and, in doing this, Mr. Blomfield jocularly said it was inoculating the land, which gave it its name: this process takes place in a winter month, and in the spring some grass seeds are sown on the uncovered spots; but, before the end of the summer, the pieces of flag extend themselves, and, uniting, the whole not only appears to be, but really is, the same as old pasture. I saw thirty acres near Mr. Blomfield's house, a most ordinary soil, light and gravelly, and not worth 5s. an acre, under this process, become an excellent pasture, worth at

least £1 10s. an acre. Mr. Coke was preparing a large piece, within view of the house at Holkham, to be thus improved. I asked Mr. Blomfield how the thought occurred to him; he said, from observing pieces of flag laid on the hedge-row banks, and beaten firmly on with a spade when these banks are dressed, and which, he added, soon extended themselves and covered the banks, if free from weeds, with a similar flag.'

Mr. Coke's system of husbandry is the *drill system*, which he adopted at a very early period, and his extraordinary success in it is owing to the progressive improvement he has effected in the process, so as effectually to answer the purpose of loosening the soil, at different seasons, and of completely extirpating weeds. The advantage of deep and repeated ploughings and harrowings, to clean, loosen, and pulverise the soil, preparatory to its receiving the different seeds, every one knows, and, to a certain degree, this is practised on every farm; but the importance of stirring the soil, destroying weeds, and earthing up the young plants in the summer months, was not ascertained until effected in the drill system, by horse-hoeing, &c.; and Mr. Coke's great improvement in it, derived from his long experience, consists in his having gradually drilled at wider distances.

When the drilling of wheat was first practised, the lines were four and six inches distant. Mr. Coke now drills it at nine inches distance, which admits ample room for horse-hoeing, in the spring and early summer months, obviously much more effectual in loosening the soil, destroying weeds, and moulding up the plants, than hand-hoeing, particularly as usually practised by women and girls; who, in most instances, by a partial stirring of the earth, and an incomplete destruction of weeds, promote the more vigorous growth of those which remain. But he does not think it advisable to earth up white-straw crops, and therefore, in horse-hoeing wheat, he does not recommend moulding up the plants.

The true estimate of every process in agriculture must indeed be obtained from experience; but the drawing earth round the stems would seem to promote their tillering, or the production of new stems by suckers or pullulations; and this was one of the great advantages which Tull, who has unquestionably the merit of having been the first to suggest the drill system, expected from horse-hoeing wheat. And it is worthy of remark to what an extent the stems may be multiplied under favorable circumstances, an indispensable one being the supplying the lower part of the plant with fresh earth to work in. The most perfect way in which this can be effected is, obviously, by transplanting. Dr. Darwin, in his *Phytologia*, gives a drawing of a plant of wheat taken from a corn field in the spring, which then consisted of two stems; it was replanted in his garden, and purposely buried so deep as to cover the two or three first joints of both the stems beneath the soil. On taking up the plant, on the 24th of September, it had assumed the form delineated, and consisted of six stems, p. 278. Another way of effecting a multiplication of the stems is by drawing fresh earth round the lower part of the plant, without

removing it, and which, though inferior in degree, is evidently similar in principle, to transplanting it; for, in both cases, Dr. Darwin explains the process to be effected by accumulating earth above the first few joints of the stems, whence new buds spring, generated and nourished by the caudex of the leaf, which surrounds the joint, as the original stem was generated and nourished from the grain itself, and which, like the seed, withers away, when sufficient roots have been formed for the future support of the plant. Sir Humphry Davy also entertains a similar opinion on this subject, and considers the tillering of corn, or the multiplication of stems, as favored by the drill husbandry; for, he says, loose earth is thrown, by hoeing, round the stalks.—*Elements of Agricultural Chemistry*, p. 204.

In drilling turnips, Mr. Coke has gradually extended his lines on ridges, in what is called the Northumberland method, from twelve to fifteen, to eighteen, and even to twenty-seven inches. These wide drills allow the horse-hoe of the largest dimensions, and of various forms, adapted to the different purposes of turning up the soil and earthing up the plants, to pass most readily. 1816 was the first year in which the turnips were drilled so widely, and Mr. Coke expected that the twenty-seven inch drilled Swedish turnips would exceed in weight those of eighteen inches, by ten tons an acre. Dr. Rigby saw a large piece of these, about sixty acres, in which half were at eighteen inches distance, and half at twenty-seven inches; the latter were evidently the largest, in the most vigorous growth, and certainly promised to meet Mr. Coke's expectations. Drilled turnips, however, obviously require cross-hoeing, which must necessarily be done by hand; but as this is merely to destroy the supernumerary plants, it is easily effected by women and young persons. The Swedish turnips form his principal and most valuable crop, and are sown upon the best soils, from the middle of May to the middle of June; but Mr. Coke cultivates on his lightest soils the common and the Scotch yellow turnip, both which are sown from the middle of June to the middle of July.

In 1814 Mr. Blaikie published some observations on preserving Swedish turnips, by placing them, as he terms it, and this has been successfully adopted at Holkham. They are taken up about the middle of November, or as soon as they have attained their full growth; the tails or bulb roots only are cut off, and they are placed in an orchard, or on old turf land, close to, and touching each other, with the tops uppermost, and only one turnip deep. An acre of good turnips from the field will occupy much less space when placed than could be imagined. In very severe weather a slight covering of litter is thrown over them. In this way they will keep very well, and be sound and firm in June. Those taken up in the spring, when the bulb or fibrous roots begin to shoot, and which, if suffered to remain on the ground, would greatly deteriorate the soil, may be placed in the same way; and at this time, if under the shade of trees the better.

The carrying off the Swedish turnips, and, placing them elsewhere for consumption, is, however, principally recommended on strong soils and retentive sub-soils, where they cannot

be eaten on the ground without injury. But upon light soils, and open sub-soils, the turnips should be placed where they grow, and put into beds of a proper width for a common hurdle to cover them; a furrow of earth should be ploughed against the outside rows to protect them from the severity of the weather, and from the depredations of game. The expense of placing a medium crop of Swedish turnips, with tops and tails on, is about four shillings and sixpence per acre, and five shillings per acre, when the tails are cut from the bulbs. When turnips are eaten where they are placed, the ground is hurdled off and folded in the usual way; they are chopped in pieces, and thrown about for full-mouthed sheep; but when given to young and old sheep they are cut into slices by a machine, and given to the sheep in troughs, which are frequently shifted. The refuse is thrown about, and the bottoms of the beds, where the turnips were placed, are shovelled and spread about; particular attention being paid to shifting the folds, so that the land is regularly manured. It is not generally known that the texture of the larger Swedish turnips is firmer, and the specific gravity, consequently, greater than in the smaller ones, the reverse being the case in the common turnip. The rind, the least nutritive part, is also, in the same proportion, thinner; but, were it equally thick, there would still be proportionately less of it, the surface of a large sphere bearing, obviously, a less proportion to the interior contents than the surface of a smaller sphere. These may appear trifling circumstances, but they not only show the intrinsic superiority of the Swedish turnip, but the manifest advantage of endeavouring, by a superior cultivation, to grow large ones, thereby improving their quality as well as increasing their weight per acre; and this, it is evident, can in no way be so completely effected as by the improved drill system, and which was never so convincingly apparent as in the most magnificent crops of the year 1817, both at Holkham and on Lord Albemarle's farm, at Quiddenham, in this county.

Mr. Coke is liberal in manuring for turnips: he allows not less than fourteen loads of manure per acre, the common quantity not often exceeding ten loads; he is enabled to do this by manuring his wheat with oil cake, which he drills in with the seed, one ton being sufficient for six acres; or he puts it in between the rows by the drill in the following spring, and this not only saves time, labor of horses, &c., as well as manure, but certainly answers well, as his wheat crops sufficiently prove. Mr. Coke mixes the farm-yard dung in compost heaps, by which means he not only increases the quantity, but he seems to improve the quality of the manure, so much so that he now grows better crops of turnips upon the Northumberland ridge method, with compost manure, and without oil cake, than he has formerly done, when his turnips were sown upon the flat, either drilled or broad cast, with all his farm-yard dung in the common method, and a large proportion of oil-cake added to it; and he has the advantage of reserving the oil cake for the wheat crop, to which he considers it more adapted than to turnips. The tur-

nip crop, though so highly important, has hitherto however, even under the best management, been considered as a very uncertain one, depend in almost wholly on seasons. In a rainy season it has been unusually good; but in dry seasons there is frequently a general failure; and, independent of the plant suffering from a deficiency of moisture, in its very early state, it is liable, in all seasons, and peculiarly in dry ones, to become a prey to the ravages of the fly, which not unfrequently sweeps off whole and repeatedly sown crops. Some ingenious mechanical contrivances have been applied to remedy this latter evil, and a curious trap, invented by Mr. Paul of Starston, a most intelligent and active farmer, has been successfully used in saving many crops; but its application is necessarily attended with trouble; and it is, at least, an additional source of occupation at a time when all hands are more than ordinarily employed in making hay, &c., and it has never, therefore, been generally made use of. Mr. Coke, however, no longer considers the turnip crop as an uncertain one; under his improved system of cultivation, it appears to be alike secure both from the seasons and the depredations of this insect.

By depositing a much larger quantity of seed than is usually sown, Mr. Coke produces a greatly increased number of plants, which, as the time of the insect feeding upon them is limited, obviously increases the chance of a greater number of them being ultimately left untouched; and this chance is much increased by shortening the period of the existence of the leaf on which these little animals feed, which is effected by accelerating the growth of the plants, by the stimulus of manure placed immediately under them, and also by the judicious method of depositing the seed immediately after the earth has been well stirred by the plough, by which in all seasons some moisture is evolved, and some chemical changes effected, which much favor the first process of vegetation. The leaf on which the insects feed is the first or cotyledon leaf, which is known to live only until the second or rough leaf is formed. The cotyledon leaf appears to be an expansion or evolution of the seed itself, and being probably nourished by the saccharine matter, which, from analogy, we may suppose is elaborated during its process of germination, it acquires a degree of sweetness which attracts the fly. This communication between the seed and cotyledon leaf continues, however, only until the roots are thrown out whose office it is to supply nutriment, derived immediately from the soil, to the plant in its more advanced state, and simultaneously with their formation below the surface are the second or rough leaves formed above ground; and, as soon as this curious economy between the roots and these leaves is established, the seed, no longer necessary as a source of nourishment, wastes away, the cotyledon leaves die and fall off, and, the rough leaves not being sweet, the fly is no longer attracted, disappears also, and the crop is secure.

This excellent method of cultivating the turnip will, probably, be understood by the following brief detail of the process of sowing it. It

is effected by forming trenches and raising ridges on a clean tilth, by a trench or double-breasted plough and a pair of horses, one of which always goes in the last trench, and this sets out the width and preserves the straight line with tolerable accuracy. A cart and two or three horses pass down the trenches, which are thus opened, dropping heaps of compost manure, which are spread by two men with forks, and the manure falls pretty equally in the rows; another plough, like the former, passes through the middle of the first formed ridge, divides it equally, covers the manure, and forms another ridge immediately over it; a boy with a mule, or little horse, drawing a very light roller, follows this second operation, and flattens the top of the ridges; another boy, with a like horse, follows the roller with a drill, and deposits the seed on the middle of the ridges, and a light chain attached at each end to the back of the drill and which at first sight appeared as if accidentally fallen from it, throws the earth into the drilled lines and covers the seed, and thus the work goes on, the laborers and the relative progress of the work being so proportioned, that none are idle, none stand in each other's way; the manure is not left to dry in the sun, but the operation is completed as it proceeds, and about three acres in a day, with fourteen cart loads of manure on each, as before observed, may be accomplished with one complete set.

In drilling wheat, Mr. Coke allows much more than the usual quantity of seed; ten pecks an acre are the utmost which most farmers drill or dibble, and even six pecks have sometimes been thought sufficient; but he allows four bushels an acre in October, and even five bushels in November. In depositing so large a quantity of seed, and burying it so much deeper than when sown broadcast, it certainly does not seem so requisite to earth up the plants, as probably there will ever be a sufficient number of stems derived, in the first instance, from the seeds themselves; but then a question arises, and which may merit consideration, whether there would not, eventually, be an equal number to produce ears, were a less quantity of seed sown, and the plants afterwards judiciously moulded up. It would seem, indeed, to come to the same thing, and if so in the latter case there would be a manifest, and on a large scale a very great saving of seed. It cannot be expected, that nature should conform her processes to calculations on paper; but if the production of buds and stems from the joints of wheat plants, when duly surrounded with earth, depends upon an established and unvarying law of nature, it must be the same thing whether twelve stems are produced directly, from six grains of wheat, or six stems are produced from three grains, and six more are subsequently produced by surrounding the lower joints with earth. A few experiments, conducted as they usually are at Holkham, would decide the question.

Mr. Coke is an advocate for early sowing; and, as the drill puts in the seed quickly, and, as before observed, no time is lost in carting on manure; he has seldom much to sow in November. He says he has always the best crops when the wheat is very thick in the rows; and he

never thinks it thick enough if he can easily pass his finger through the stems, near the ground. He cuts his wheat very early, even when the ear and stem are greenish, and the grain not hard. He says the wheat, thus early reaped, is always his best sample, and he gets 2s. a quarter for it more than for wheat cut in a more mature state. He, perhaps, loses something in the measure, the skin being thinner, and the grain, probably, not quite so bulky; but, if this be true, it is fully compensated by his suffering no loss by shedding on the ground, which, when the ear is ripe and the weather windy, is often not inconsiderable. He is equally early in cutting oats and peas: when Dr. Rigby observed to him that, in both these, the seeds were not all ripe; his answer was that he should lose more by the falling of the ripe seeds at the bottoms, than he should gain by waiting until the rest were ripe; and that the straw in this state, retaining some immature seeds, was of more value to his stock in the yards, than if cut later.

To prove the utility of reaping wheat early, Mr. Coke had hung up, in his own room, a few handfuls of wheat which was greenish and immature; in a few days they had ripened in the capsule. 'Mr. George Hibbert, of Clapham, a gentleman well skilled and much experienced in the cultivation of plants, was with us,' says our author, 'and he has since, in a letter, observed to me that this is a common natural process, more especially when the capsules are of a succulent nature, and which all gardeners very well know; and he mentioned a remarkable instance which occurred to him respecting a plant whose seed had no considerable envelopement. James Niven was employed by him to collect the seeds of plants in Southern Africa: he sent a specimen of a beautiful erica, lamenting, in his letter, that he had never been able to find one of that species advanced into fruit; but out of that very specimen, which he seems to have gathered in the full vigor of flowering, Mr. Hibbert actually obtained ripe seeds, and produced plants here by sowing them. When Niven returned, he showed him the specimen, and he said a very considerable progress towards fructification must have been made during the transit from the Cape of Good Hope, hither, by the rising of the sap within the specimen.'

Mr. Coke's *course of husbandry*, that is, the succession of his crops, varies but little from that which is general throughout the county of Norfolk. It is called the four or five course;—first year, turnips—second, barley, laid down with clover or other grass seeds—third, grass to cut or feed—fourth, wheat. He has, within a few years, found it profitable to lay down a certain quantity of land with cock's-foot grass, *dactylis glomerata*, and this lies two years, making the course on this land five years.

This grass does not stand for hay, but is excellent sheep feed; when fed close, it tillers very much; or spreads and branches on the ground with multiplied stems, and, in the season most favorable to vegetation, it will grow more than an inch in a few days. Sheep are very fond of it, and Mr. Coke says he can pasture more upon it than on any other layer of artificial grass. The

seeds of this grass, which is indigenous, are gathered in the woods and lanes by women and children, who cut the tops off with scissars, about six inches long, an inch and a half below the lower spur; they are paid 3d. a bushel for it, measured as hay; one bushel of seed is obtained from seven bushels of it in the state it is thus gathered.

Though not cultivated as other artificial grasses, in the regular course of husbandry, saintfoin has been found, at Holkham, a valuable source of hay, and of autumnal pasturage. It was first cultivated in this district, in the year 1774, upon the Brent Hill Farm, by Mr. Beck, the then occupier. Mr. Beck's example was followed by Mr. Coke, and he has cultivated saintfoin, in Holkham park, about forty years. It seems most adapted to thin soils, incumbent on chalk. The seed is generally sown, in the pod, at the rate of five bushels per acre, with the barley, after a turnip crop; nine pounds of trefoil per acre are sown at the same time. The saintfoin being in pod, attention is required to bury the seed properly. The trefoil produces a crop to mow in the following year, and dies away in the succeeding years. The saintfoin is not in full perfection until the third and fourth years. It continues good until the ninth year, after which it becomes weaker, and is ploughed up for the land to go through a regular course of husbandry. The saintfoin is seldom manured or top-dressed: it produces a ton and a half of hay per acre, annually, while in perfection. It is never spring-fed, but is depastured by all sorts of cattle, to consume the after-math in autumn.

Mr. Coke is ever ready to try the cultivation of any new article. The introduction of the Swedish turnip into general cultivation is much owing to him. I was pleased, says Dr. R., to see a crop of mangel wurzel in a good state; and he told me he had procured some Heligoland beans, a new and promising article, which is said to yield sixty bushels or fifteen coombs per acre, and he proposed dibbling them on the transplanted land; but I saw no cabbages, no succory, no burnet, no parsnips. In Mr. Blaikie's pamphlet, on the Conversion of Arable Land into Pasture, he gives the result of two trials of dibbling the Heligoland beans on this land; the one was upon land which had undergone a complete summer fallow, previous to its being transplanted; and the other was land from which Swedish turnips were taken up in November, but they seem not to have answered in either case; the failure is, however, attributed to the beans having been put into the ground too late. In another instance, Poland oats were sown, and produced twelve coombs per acre.

Mr. Coke's flocks are highly estimated, and he is distinguished for his skill and attention in this branch of rural economy. His sheep are all Southdowns, but he told me he had not the merit of selecting them himself. Some years ago he was visited by some gentlemen from the South of England, who found much fault with the Norfolks, which then composed his flocks, and told him that the sheep in their county, the Sussex Southdowns, were much more profitable and better adapted to his pastures:—he bought

500 on their recommendation, and, finding they fully answered his purpose, he got rid of his Norfolks, and has had none since but the Southdowns. Mr. Coke was much gratified on finding that Mr. Cline confirmed this preference in his paper on the forms and constitutions of animals, in which he considers the characteristic mark of health and vigor, in an animal, to be the expanded chest, the thorax which has ample room for the free play of the heart and lungs. In the Norfolk sheep the sternum terminates almost in a line or edge, the ribs contracting too much as they approach it; while the chest of the Southdowns is more rounded and wider, terminating with a less angle at the sternum. He remarked, on showing Dr. Rigby his admirable dairy of North Devon cows, the same characteristic superiority of form over the Norfolk cows. He particularly pointed out the flat line the ribs take in spreading from the spine, in the upper part of the chest.

When Mr. Coke came to his estate at Holkham, the rent was £2200,—this was forty-one years ago. The produce of his woods and plantations amounts now to a larger sum; for he has had the spirit and judgment to plant 1500 acres; the greater part of which have become magnificent woods, which have not only by their picturesque beauty, unspeakably improved the landscape; by their protection in checking the cold rude winds, so prevalent on this coast, materially softened the temperature; and, by the annual fall of their leaves, even contributed something to the fertilisation of the soil; but, at this time, the annual fall of timber, poles, and underwood, from them, averages about £2700. The timber and poles are applicable to most building purposes; some of them are used in the buildings, which he is constantly carrying on upon an extensive scale; his houses, cottages, barns, stables, and other farming buildings being all in a superior style of architecture; and the remainder is sold in the neighbourhood.

‘I saw,’ says Dr. R., ‘a handsome house, built in the summer of 1815, and now occupied by his head gardener: the doors, windows, floors, stairs, as well as the roofs, joists, spars, &c., were all of Scotch larch, and spruce fir, of Holkham growth; and his timber yard, from the same source, displayed no mean quantity of rough timber, balks, planks, &c. In the plantations, several of which I rode through, the oaks and Spanish chestnuts have already attained a considerable size, and are in a state of vigorous growth; some of the oaks, particularly those near the house, being the largest I ever saw, of the same age; these in time will, obviously, become the most valuable timber on the estate; in time they may even supply our future wooden walls, and, under a change of form, navigate the very sea which washes the shores on which they are now growing.’

Firs, of the different species, the Scotch larch, spruce, and silver, have attained a sufficient growth to be applied to the above-mentioned useful purposes; and, like the oaks, for many years to come, will have an increasing value. There are also other trees, which, though of a subordinate character. Mr. Coke turns to a good

account; the *Salix cœrulea*, or the French willow, at six years' growth, can be advantageously riven into laths, which are very tough, and answer the purpose quite as well as those made of foreign deal: the *populus monilifera*, the Canada poplar, also grows very luxuriantly. The wild cherry is also cultivated extensively, and its timber is valuable for all building purposes, when of forty or fifty years' growth. Another poplar, the black Italian, said to be the most profitable for planting of all poplars, is judiciously planted as a skreen, round some barns and farming buildings.

Mr. Coke's system of letting his estates is not less excellent than his farming system: a long lease and a moderate rent cannot fail to be highly advantageous both to landlord and tenant; to the occupier it affords every encouragement to invest capital, and every motive for the skilful cultivation of his farm; and to the landlord eventual permanent profit in the improved value of his estate. The following have been the important results:—Mr. Coke's tenants are enriched, and his property has increased in value to an almost incredible degree. He gives twenty-one years' leases, and he has already seen the termination of such leases on most of his farms, and, though he continues the same encouraging system of long lease and moderate rent, his present relatively moderate rents, relatively as to the improved state of his farms, have admitted the total increase of his Norfolk rents to amount to the enormous sum of £20,000; an increase in the value of landed property, a creation of wealth, probably, unexampled, except in the vicinity of large towns, or in populous manufacturing districts. On the renewal of many of his leases, he has given the tenants the bonus of a capital house: these afford not only every possible accommodation to his tenants' families, but are striking ornaments to the country.

Irrigation is one of the superior improvements in agriculture, which Mr. Coke has advocated and adopted; but this can, obviously, be only effected in peculiar situations, and can only be undertaken by persons of considerable capital. The situation of Holkham does not admit of irrigating to any extent; but even here Mr. Coke exhibits a water meadow, where it could be little expected; it is near the house at Longlands, his principal farm, and rather on high ground; the source is a large pond, originally formed for the common purposes of a farm-yard. There may be a spring which feeds it in some degree, but its principal supply is from the heavens. When the pond is full, the water is well-directed to an adjoining meadow, whose level is a little below it. To a certain degree it has its use, but the supply of water is inadequate to an extensive and long continued irrigation.

'The best specimen of complete irrigation, on any of his estates, is at Lexham,' says Dr. Rigby, 'which I have seen, when visiting his respectable tenant there, Mr. Beck. A small stream, tolerably well supplied, runs through a little valley of ordinary meadow land; a large reservoir of several acres has been formed by an embankment, and raised so much above the contiguous grounds as to admit of many streams, in

different directions, being conveyed over an extensive surface of land, to which they impart a wonderfully fertilising principle, and by anticipating the common period of the growth of grass in the spring, and by continuing it luxuriantly during the whole seasons of vegetating temperature, the supply of grass is much more early, and infinitely more abundant, than could be obtained on the land of such a farm under common circumstances. The grass which first shows itself in the spring, in the watered meadows, is the *festuca fluitans*, the long and broadish leaves of which are known to float on the surface of water, in ditches, &c. The cattle are very fond of this grass, and, on being first turned into these meadows, run with eagerness to get it. These water meadows were well designed and executed under the direction of Mr. Smith, the engineer, but at a very considerable expense. Mr. Coke, who has given a long lease of the farm to Mr. Beck, is said to have been at half of the expense; and, in addition to it, he has built him an excellent house, on a rising ground, and at a proper distance from the water, which is here as much a feature of decoration and beauty as in any gentleman's ground; and the whole would form a picturesque scene, were more trees growing on the opposite side of the water.'

Dr. Rigby afterwards visited Holkham at the sheep-shearing. At this time, he says 'considering the extreme dryness of the season, the crops, particularly the wheat, were excellent. The Devon cattle were not only beautiful, but, by the state of their flesh, they betrayed no marks of the prevailing drought, it being a peculiar excellence of this stock that they will keep themselves in good condition in moderate pastures. The flocks of Southdown sheep appear to be every year improving, showing the judicious and unceasing attention paid to them. About three o'clock the company returned to the hall, and not fewer than 300 persons sat down to dinner in the statue gallery, Mr. Coke presiding at one table and the earl of Albemarle at the other. After giving 'a fine fleece and a fat carcass,' Mr. Coke proposed the health of 'lord Erskine, who sat near him. He should not, however, he said, give him as a lawyer, but as a farmer. The circumstance of his lordship having, of late years, turned his attention to agriculture, and having been, several times during the morning engaged in conversation with him on the subject of Merinos, whose cause he seems disposed to advocate, he was induced to anticipate some observations from his lordship on that subject, and, in a vein of humor, alluded to the rudiments of his lordship's agricultural studies, and the progress he had made. I am led to hope, said Mr. Coke, that we shall hear something instructive, especially on the subject of Merinos, which, you know, has many times been discussed in this room with great good-humor. It will give me pleasure, and I am persuaded it will give you all pleasure, to hear his lordship inform you of his great success. I am fond of instruction, have met it many times where I did not expect it, and look for it now very anxiously.—I know his lordship's abilities; but I fear the subject is

a difficult one, as I have never yet known a good carcase supported under 10 or 12 lbs. of such close and fine wool; and I have long been convinced that good carcasses and fine fleeces together, early maturity and a quick return, which we have in the Southdowns, will always beat the Merinos.—Their backs are as narrow as rabbits, and their faults appear to be incorrigible. Perhaps every one here may not think so, and I know there is a considerable party of public-spirited gentlemen who still persist in the Merino cause. I am persuaded they do it from the best motives: I heartily wish them success, but I do not envy them; I do not envy my honorable friend here, and hope he has reaped a plentiful and encouraging profit. For my part, I am governed by experience, and I always make haste to discard error when I find it out. I must beg, however, to relate an anecdote, which will show you what immense progress his lordship must have made in these studies, since the first time I had the honor of his company here, to venture upon such a subject. He was riding with me in a barouche by a field of wheat, some years ago, at a time when he certainly was not prepared to enlighten us on the difficulties of the point in question, and he suddenly clapped his hands together, and exclaimed, ‘What a beautiful piece of lavender!’—but since that time, gentlemen, his lordship is, I know very well, considerably improved, and may be thoroughly prepared to defend the cause upon which I have so long been in an error, if it be one.

His lordship, in reply, commented, in a strain of pleasantry, on Mr. Coke’s observations relative to his studies in agriculture. He had studied it under an able master, and, if he had made no considerable progress, it must be owing to his own want of capacity. He, however, assured the company that he did know wheat from lavender; but he certainly had made the exclamation alluded to; and was it to be wondered at? He had seen wheat many times before; but, never having seen any so admirably cultivated, was a sufficient reason for his not knowing the plant again.—He had seen such facts and examples at Holkham, that he had been struck with the conviction that agriculture must be an important branch of knowledge: important not only to the good of mankind, but to mental improvement; to the understanding of a man, and to the science of a philosopher. He had indeed, his lordship observed, commenced his study of agriculture late in life, when, perhaps, the vigor of his attention was spent in other pursuits, more important to him at the time, but never more pleasing. It is this day, said his lordship, forty years since I was called to the bar;—I have studied Coke at Westminster, and I now study Coke at Holkham. But the difference between these studies is very great; they differ as the laws of man differ from the laws of nature; as a complex and opposing system of facts and precedents,—where no two cases can be perfectly parallel, where human interests and passions are perpetually excited, where human evidence is often incomplete, often doubtful,—differs from that order and regularity, where the finger of nature points to certain conclusions; where

the fruits of our skill and labor rise to give testimony; and where the very earth is eloquent, and speaks nothing but the truth. If, continued his lordship, we only consider the subject of manure, we shall perceive one of the most striking bounties and benefits of the divine ordination, and of that wisdom with which we are blessed, in a thousand ways, without our knowing it: this very substance, the refuse of every thing, had it been useless, must have accumulated in heaps, intolerably noisome, and perpetually pestilential; but, by the blessing of providence, it is every man’s interest to remove these otherwise increasing mountains of filth, and by decomposition, in various ways, concealed in a great measure from us, it gives increase to our fields, and adds to the means of industry and the reward of the husbandman. In allusion to what he was expected to deliver in the Merino cause, his lordship very pleasantly waived the subject, by saying that it was a subject on which he was yet considerably deficient in knowledge and experience, and he must take a few more lessons before he could venture to sum up the evidence before such a jury.

In proposing the health of lord Lynedock, Mr. Coke took occasion to advert to the Scotch husbandry. He alluded to a report which had prevailed, which had perhaps been industriously circulated, and eagerly listened to, as all calumnies were, by many persons. It had been said that he had found fault with the agriculture of Scotland. Found fault! said Mr. Coke, to be sure I did, and I praised it likewise. But the first only is remembered by those who would malign my observations. If there be a fault, it ought to be noticed, or how should we improve? The truth is, the agriculture of Scotland deserves very great praise, and especially their turnip husbandry, which equals any thing I ever saw. If I had wavered before in opinion, I should have been at once convinced of the decided superiority of the ridge system, by what I saw in Scotland; and I now think it my duty to declare my conviction that the ridge system of cultivating this crop is not only the best for producing the largest crops, but it will obtain, what can never be insured by the other, a certain crop. By what we witness this year, notwithstanding the drought, the crops in this neighbourhood, by the ridge system, are both forward and promising; and, as this is the foundation of the success of the whole course, it must be the most important point in our favor. Mr. Coke then congratulated the neighbourhood around him, for having very generally adopted this system, for which they were much indebted to Mr. Blaikie. The fault he had found in Scotland, Mr. Coke observed, was that the land, with the crop after turnips, was not so clean as it might be, and he was induced to observe it, in order to draw the attention of the Scotch farmers to the probable defect there might be in cleaning the fallows; but he willingly allowed that they had a very troublesome weed in the north, which seemed to be peculiar to Scotland; and, as the root was a small bulb, it was difficult to be destroyed. It increased so much in the land before the field came to wheat, that the crop, if lodged, would be presently tied

down by the stems of this weed growing through it, and it could not rise to ripen the grain. He said he had visited lord Lynedock's farm, and he was beyond measure gratified at his reception. The noble lord had carried inoculation into Scotland; he thanked him for it, and it proved that this meeting did good.

In the course of this meeting, Mr. Coke stated that it had existed forty-two years. Upon no former occasion had it been so numerously attended: a proof that the motives for its establishment had met with the approbation of his neighbours, and that the result had been favorable to the country. He trusted that it would still increase in numbers every year, and that he should be honored with the company of all who desired to see agriculture cultivated on the liberal principle of a community of interest between landlord and tenant. When he began this institution, the land of Holkham was so poor and unproductive that much of it was not worth 5s per acre.—He began with a trial of the Leicester breed of sheep; but, by the advice of Mr. Ellman of Sussex, he was induced to adopt the Southdown breed, and to that admirable stock he much attributed the progress which Norfolk had made in cultivation. The extension of farms, where flocks were to be employed, was unavoidable. Such farms must be large; but if capital and skill were applied to them, and the flocks were made the means of increasing the corn produce, so far from its being injurious, as a question of political economy, experience had proved it to be highly advantageous, since he could state, from actual enumeration, that three times the number of inhabitants were maintained on the same space of ground as before; the population of Holkham had increased from 200 to 600, within a few years back, since cultivation, by the union of capital and skill, had advanced. In all his parish there was scarcely a single individual, of any age, that did not find full employment, and they even wanted hands.—He had been applied to, some time ago, by the principal inhabitants of the three parishes of Holkham, Warham, and Wighton, to say that their poor-house was no longer wanted; that, in fact, it was a burden to keep it up; their poor were so much diminished, they had no use for it. And when he told them to consider well what they were about, and to look forward to times when the poor might increase upon them, they replied, they were convinced that, by the spirit of independence which their comfort inspired, and the certainty of labor, they had no dread of a reverse, for the whole district was industrious and moral.—The workhouse was therefore pulled down, and the aged and infirm were a small burden on the three parishes. The introduction of the drill husbandry, which he could now, from the most ample experience, recommend, had justified all the hopes he had entertained of it. It was the most profitable course a farmer could pursue, and, with the turnip crops, completed the Norfolk system of husbandry. He paid merited compliments to Mr. Blakie, his steward, for superior talents, indefatigable attention, and integrity in the conduct of his affairs, as well as for the many plain, practicable, and ingenious communications he had given to the public; and he

spoke, with warm eulogy, of the ardent manner in which his efforts had been seconded, not only by his own tenants, but by many of the noblemen and gentlemen, as well as yeomen, his friends and neighbours.

PART V.

OF IMPLEMENTS OF HUSBANDRY.

Upon this topic we can of course accomplish nothing more than a *selection* of the most approved modern instruments of agriculture. Many of the machines and implements involved meet our separate attention in their alphabetical places: others, as the peck, the mattock, the spade, fork, &c., seem too minute, and of too universal application, to be inserted in a work of this description.

We begin therefore with the most important, perhaps, of agricultural implements.

1. *Of ploughs.*—In our plate AGRICULTURE (Plate I.) are figures of ploughs, whose names are given. The first, the Roman plough, has good authority for its iron part or share, such as it is; but we are doubtful as to the wheels and handle.

The Roman plough was according to Cato of two kinds, one for heavy and one for light soils. There is a plough still in use in Spain, which is supposed to come the nearest to the Roman implement generally used. It is our fig. 2, plate I. RURAL ECONOMY.

Virgil describes a plough with a mould-board used for covering seed and ridging: to supply its place a sort of diverging stick was used, it seems, in the form described: this stick appears to have been inserted in the share head, or lield obliquely and sloping towards the side to which the earth was to be turned. The Romans did not plough their fields in beds, by circumvolving furrows; but the cattle returned to the same furrow. Virgil also mentions wheel ploughs, which Lasteyrie thinks were invented in or not long before the time of Pliny, who attributes the invention to the inhabitants of Cisalpine Gaul. Lasteyrie gives figures of three wheel ploughs from a Sicilian model, and from Caylus's Collection of Antiquities.

Cato says, of ploughing, What is the best culture of land? Good ploughing. What the second best? Ploughing in the common way. What the third? Laying on manure. The Roman season for ploughing was any time when land was not wet: in the performance, the furrow is directed to be kept equal in breadth throughout, one furrow equal to another; and straight furrows. The usual depth is not mentioned, but it was considerable, as Cato says corn-land should be of good quality for two feet in depth. No scamm or balks (hard unmoved soil) were to be left, and, to ascertain that this was properly attended to, the farmer is directed, when inspecting the work done, to push a pole into the ploughed land in a variety of places. The plough was generally drawn by one pair of oxen, guided by the ploughman without the aid of a driver. In breaking up stiff land he was expected to plough half an acre; and in free lands an acre; and light lands one acre and a half each day. Land was ploughed in square plots of 120 feet to the side, two of which made

a jugerum or acre. We may here add, though a little out of place among mere implements, in most cases a crop and a year's fallow succeeded each other; though, when manure could be got, two crops or more were taken in succession; and on certain rich soils, which Pliny describes as favorable for barley, a crop was taken every year. In fallowing, the lands were first ploughed after the crop was removed, generally in August; they were again cross-ploughed in spring, and at least a third time before sowing, whether spring corn or winter corn was the crop. There was, however, no limit to the number of ploughings and harrowings, and when occasion required manual operations; the object being, as Theophrastus observes, 'to let the earth feel the cold of winter, and the sun of summer, to invert the soil, and render it free, light, and clear of weeds, so that it can most easily afford nourishment.' (*Theo. de Caus. Plant. lib. iii. c. 25*). Manuring was held in such high esteem by the Romans, that immortality was given to Stercutius for the invention.

To return to our modern ploughs. In the 'Rural Economy of Yorkshire,' after the similarity of the principles that are requisite in the construction of the ship and the plough is noticed, and the difficulty of fixing and reducing them to a regular theory as nearly the same, it is observed that the art of construction in either case is principally attained by practice. In this district, says the writer, the ploughs of different makers pass through the soil with various degrees of facility and execution; nevertheless, though he has paid some attention to the different makes, he finds himself entirely incapable of laying down such particular rules of construction as would do his country any service, or his work any credit. Even the general principles of construction he must mention with diffidence.

The principal difficulty in the construction of a plough is that of adapting it to all soils, in all seasons, and to all depths. If the soil break up in whole furrows, every inch of depth requires in strictness a separate plough, or a separate regulation. Here rests the main objection to the winding mould-board, which admits no regulation in respect of depth. If the semi-arch, or nollow of the hind part of the mould-board, be raised sufficiently high to turn a thick furrow completely, it is of no use in turning a thin one. On the contrary, if it be brought down sufficiently low to turn a shallow furrow properly, it is impossible to turn a deep one with it in a workman-like manner. There is not room for it within the hollow, or semi-archway of the mould-board. The inevitable effect of this is, either the furrow is forced away wholly by the upper edge of the mould-board, and set on edge; or the mould-board rides upon the furrow, raising the heel of the plough from the ground, the bad effects of which need not be explained. An upright stern, with a moveable heel-plate to turn the furrow at any given depth, is, in this point of view, much preferable to a hollow mould-board; and, if its use in raising a crest of mould, for the purpose of covering the seed, be added, its preference is still more conspi-

cuous. But some of these inconveniences have been obviated by the invention of moveable mould-plates, as will be seen afterwards. Yet, in the construction of all sorts of ploughs, there are, notwithstanding, a few points or circumstances that ought to be particularly and in all cases attended to; such as the following: that part which perforates the soil, and breaks it up, and which is usually termed the throat or breast, should have that sort of clean, tapering, sharpened form, that is introduced with the greatest readiness, and which affords the smallest resistance in its passage through the ground. According to some, this part should be long and narrow, making an acute angle with the beam, as the length of the breast is supposed to have a tendency to preserve the flag from being broken, on account of the surface for its support being longer; which is a circumstance of consequence in the ploughing of old lays for wheat, pease, and other similar crops; as, by such means, the growth of weeds through the broken ground is prevented. And the resistance of the earth against the breast is likewise lessened, in proportion to the acute angularity of that part against the beam of the plough. The mould-board should also have that sort of curved, twisted, or hollowed-out form, which is best calculated to lessen resistance, and at the same time give the furrow-slice the proper turn. And the beam and muzzle of these implements should likewise have such a construction as that the team or moving power may be attached in the best and most suitable line of draught, as this is a circumstance of great importance, when several animals are made use of together, that the draught of the whole may coincide in the most perfect manner, and with the utmost exactness. Likewise, in the construction of every sort of plough, much regard should be paid to the weight, so that they may have sufficient strength for the purpose, without being unnecessarily heavy. Much may be done in this intention, by lessening the quantity of wood in those parts where there is no particular stress, while it is retained so as to have full power in the others. This has been much less attended to in the making of ploughs than its importance would seem to demand.

It is noticed, in the Agricultural Survey of the County of Essex, that the throat at the fore end or neb of the plate or breast in the Norfolk, and most other ploughs, with the exception of the Rotherham, rises from the upper surface of the share too perpendicularly, and too much at right angles to the line of friction, or pressure of the earth the plate has constantly to act against: working thus abruptly in the ground, the slice or furrow is violently torn, or burst from off the ground hand, broken and imperfectly turned over, instead of being gradually cut, raised whole, and whelmed over; as will always be the case, when the plough enters the ground obliquely, and at a proper angle; and that the plate or mould-board is properly turned for raising up, and turning the slice completely over. It is a clear position, proved by experiment, that a semi-ellipsis is the true form of throat which is necessary in ploughs, which is the part

or space from the share point to the junction or approach of the breast to the beam: and that there is found a remarkable variation in the form of the breasts, or mould-boards of the ploughs throughout the northern parts of the same district, and which is chiefly in the degree of concavity or convexity. Some wheel-wrights and farmers prefer a form rather concave, a flatness in the fore part, which joins the share, and which gradually fills up as the sweep recedes; others like it neither concave nor convex; and there are many ploughs in which the convexity is extremely great. The great length of the *breast*, in some ploughs, is a circumstance which gives steadiness to the implements; but, at the same time, it is probably the means of increasing the draught to the horses in a great degree. The shortness of the breast, if the curve or sweep be in perfection, or wears equally every where, may lessen friction, and certainly does, if the earth be loose; but it probably may not have the same effect in the first earth, upon a stiff layer. It is, however, a pretty general opinion, that it lessens it in all cases. A great variety of breasts, of different forms and constructions, are represented in the plates upon ploughs, in the Agricultural Survey already referred to, which are well worth consulting by the enquirer.

From the end of stilt on landside to the point of the share	Feet.	Inches.	} whole length
From the end of beam where inserted into it to ditto, of ditto	7	4	
Length of beam	3	0	
Width of the head in the widest upper part	6	0	} bottom working surface.
Ditto of ditto at lowest part	1	4	
Ditto of share behind the wing	0	9	
Length of surface on which the plough touches the ground	0	3½	
Height from ground to top of beam where coulter goes through	2	10½	
Width between stilts at the end	1	8	
Height of ditto from the ground	2	6	
Weight of wood and iron work, about 1¼ cw	1	11	

And it has also a copse rack, or hock with teeth, to admit of more land being given to the plough, or the contrary, which is particularly useful in many cases.

It is noticed that with a few trifling alterations it is made use of over the whole district, and from that being often called the Dutch plough, it is supposed to have been originally brought from Holland by the inventor.

In Mr. Bailey's improved Rotherham plough the mould-board, which is of cast-iron, is so formed that the sod to be raised presses equally against it, in every part, from the sock point to the place where it leaves it; and it varies from other mould-boards, in not beginning to take its rise from the bottom of the heel, but at least twelve inches farther forward towards the sock, and in being cut away at the bottom opposite the heel, about three inches high, from the sole, by which the turning of the sod or furrow-slice is said to be much facilitated. Thus improved, these ploughs have been found to answer perfectly in different trials, and have been allowed by those who have seen them

The old *Norfolk plough* of our plate I. AGRICULTURE is held in much esteem in that, as well as some other light districts, as performing the work in an easy and expeditious manner. The carriage and wheels in all ploughs of this nature, however, form objections to them, and render them clumsy implements. The wheels added to them in our figure are an improvement.

The head and beam are short; the carriage part and wheels stand very high, of course the fore end of the beam is much elevated, by which advantage is gained in driving the horses, as it is usually drawn by two horses yoked abreast, the ploughman directing them by reins.

Of the swing sort, the Rotherham plough is perhaps the most popular. See AGRICULTURE, plate I., figure 3. It is a light useful plough for all the less heavy sorts of soil, and has certainly much superiority where one plough is only required, and where the advantageous and economical method of performing the work with one man and two horses without a driver is used. It is in much estimation in all the West Riding of Yorkshire, and is said in the Agricultural Survey of the Riding district to have been invented by Mr. Joseph Foljambe, of Eastwood, about seventy years ago. In that district its usual dimensions are

at work to go with more ease to the teams than most others. It has been supposed that the beam, from its crooked form, which is obvious in some of its improvements, by being fixed so low down in the part next to the handles, makes the plough require less force, and to go in a more sliding manner. And that from the fore end of the beam being so much higher than the hinder part, the holder of the plough has more power, as the draught does not oppose so much resistance to him; for, if the beam were fixed to the handles much higher, as is usually the case in other ploughs, this plough would be constantly rippling on the point, and in that way increase the weight of draught. And where it meets with any resistance, such as a stone, it is liable to rise up, while in this form it proceeds in a sliding manner, which affords a steadier motion, and renders it more easily held. Besides, it is much stronger; particularly in the part where the left handle and the beam are joined, underneath the mortise where the tenon of the beam; by which the bearing of the ploughman on the handles does not in the least affect that part,

which in other ploughs is the weakest. In this improvement of the Rotherham plough the mould-board is so constructed at the breast as to have a slight degree of convexity, instead of being concave, as is often the case, by which the furrow-slice is supposed to be prevented from slipping down; and by the keeping the lower part from the ground, when it comes to the turn of the breast, it falls off; consequently, as the furrow-slice is rested on or by the side of the breast, when the plough has advanced twelve inches the work is finished. By this improvement it is supposed that the plough will turn a furrow of any extent, from four to eighteen inches, where requisite, and the same in depth; as the plough that will produce a wide furrow and turn it well is capable of ploughing deep: the convexity of the breast also causes it to clean itself better, which is a desirable property, as it is thereby rendered less heavy, and less resistance afforded by one portion of earth being prevented from rubbing upon another, and at the same time the work performed in a more perfect manner. The coulter has likewise a position so as to cut in a slanting manner, which causes any resistance to rise up more expeditiously, and the land to be opened with more facility than where it has a more perpendicular direction. Where this improved plough is employed with more than two horses abreast, the additional ones must be put before the pair, as it has not land enough to follow single horses.

Wheels have been added to these ploughs for particular purposes; and with either one or two fixed near the points of the beams, without any carriage parts, they have been found to pass through the soil in a very light, easy, and steady manner, and where there are two to require no holder in many cases, except in setting in turning out of the work at the ends of the ridges.

The *Northumberland* or *Cumberland* plough is only an improved plough of this kind.

Small's chain plough is esteemed one of the best of the swing kind, and seems capable of very extensive application. It has its name from that of the inventor, who constructed it about forty years ago. It is neatly formed, and very light in its appearance, but at the same time, from the addition of the chain, possessing great strength. It is, therefore, capable of being employed in strong rough sorts of soil, where other sorts of ploughs are liable to be destroyed, as when the share, or even the coulter, in this implement, meets with any sudden impediment or obstructing cause, the stress is immediately thrown upon the chain instead of the beam. The sock is formed with a fin or feather, by which the firm earth in the bottom of the furrow is cut and moved more readily, and in a more complete manner than could be done by the sock in the common plough. In this plough the mould-board is mostly made of cast-iron, having a gentle curve, by which the furrow-slice is thrown off with the least possible resistance. It is supposed by Mr. Donaldson to be on the whole one of the best constructed swing-ploughs for all sorts of soils. It is capable of ploughing, with one man and two horses yoked abreast without any driver, more than an acre a day with the

greatest ease. A plough of this sort is shown at fig. 1., plate II., *RURAL ECONOMY*.

Lord Somerville's single plough is also a plough of this sort, in which the throat is sharpened, and the mould board rendered moveable in the manner of his double furrow plough, shown in fig. 5 of plate *AGRICULTURE*. It is capable of being made use of with advantage in breaking up deep stiff soils, as from the moveable nature of the extreme part of the mould-board the furrow-slice can be laid more or less flat.

Duckel's skim-coulter, or *trenching* plough, is an implement of this sort, capable of being employed with great advantage where the surface is coarse or grassy. The principle upon which this plough operates is that of trenching ground in the practice of gardening, or depositing the surface spit of earth in the bottom of the preceding furrow, and placing the second, or that taken from below, upon it. Where the soils are sufficiently deep it is capable of performing its work to a considerable extent. It has been observed by Lord Somerville, in a little tract on ploughs and oxen, that the skim requires a perpendicular direction, and that the coulter-hole should be removed farther from the throat and share, as in the common position it would choke when in work.

The use of the *paring plough*, the fourth figure of the plate *AGRICULTURE*, will be shown in that part of this article which treats of 'preparing' land on the arable system,

Plate I. *RURAL ECONOMY*, fig. 3, shows a plough to be made entirely of iron, to which a new kind of share is attached, the invention of Mr. Pinlayson. This share, *a*, instead of having its cutting edge curved, or forming an obtuse angle with the land side, is made straight, and extending nearly the whole length of the mould-board, at an acute angle with the land side. At the back part of the share a triangular piece, or wing, *b*, is to be introduced occasionally by screwing its pin into a hole in the share, for the purpose of enabling it to turn and accommodate itself to the way of the plough. The intended purpose of this wing is to cut the clods of the earth, and break them in a perpendicular direction. In order to prevent the plough from choking at the coulter, the beam is made to curve upwards as seen at *c*, the coulter being introduced at the under side, and made fast by wedges. Another contrivance to effect the same object is shown at fig. 4, and consists in opening the beam by lateral curves, *c, c*, the coulter being attached by screw bolts, and rounded off at top. By these means, should any stubble or other vegetable matters accumulate in front, they would be enabled to rise over the top of the coulter without choking or obstructing the progress of the plough. For the purpose of regulating the depth at which the share shall cut the ground, the shackle by which the plough is drawn is to be shifted higher or lower, at the muzzle or nose of the beam. This is done by means of a screw, *d*, in fig. 3, which passes through the bolt of the shackle, and, by being turned, moves the shackle higher or lower, and thereby causes the share to be drawn through the ground at a less or greater depth beneath the surface, as circumstances may re-

quire. The mode of adjusting the lateral draught of the plough so as to give the share more or less land, and also to enable it to be drawn by a single or double team of horses, is by the addition of a bar *f*, fig. 5, to the end of which one of the drawing shackles is to be attached. The plough, shown at fig. 5, is constructed in every respect upon the ordinary principles of what is called a Scotch plough, the side bar only excepted, which by sliding horizontally, in a lateral direction upon a plate *g*, may be set at any angle to the beam, and, being there fixed by a bolt, will cause the plough to follow a certain course to which the draught by the adjustment of the bar will incline it.

The skeleton plough, fig. 6, designed for wet land, is constructed of bars set in the usual form of the mould-board, and landside; these bars may be either square or round, and set by screws or bolts, cradled together so as to produce the general figure of those surfaces. The object of this construction is that the earth shall not adhere to the surfaces, but pass through between the bars, and by that means allow the plough to clear itself as it proceeds.

Fig. 7 represents the improved harrow; it is formed of bars, which support a peculiar sort of tines (shown detached at fig. 8, and another form at fig. 9). The intention in forming these tines with rounded heads is that the stubble, roots, and other vegetable matters, may be enabled to rise over the top of the tines, and clear them. In order to regulate the depth at which the tines of this harrow shall penetrate the ground, the carriage of the fore-wheel is connected to a lever bar, *a*, by the raising and lowering of which the nose of the harrow is depressed or elevated to any required distance from the ground, and consequently the depth to which the tines are intended to penetrate will by these means be determined. The lever that regulates the fore-wheel is held at the hinder part of the harrow by a spring-guide, *b*, consisting of two rods placed close together with swells or bands, forming open spaces at several parts for the lever to rest in. When the tines are intended to penetrate the ground to the greatest depth, the handle of the lever must be raised to the top of the guide; but, when the tines are to be drawn out of the ground, the handle must be pressed upon so as to cause the lever to fall to the bottom of the guide, the elastic lateral pressure of the guide holding the lever in any intermediate position to which it may have been shifted for adjustment. As it is frequently necessary to lift the tines of the harrow out of the ground instantly, without stopping the horses, as in turning at the headlands, that may be done by merely pressing upon the handle of the lever. The hinder wheels of the harrow are also to be raised or lowered to correspond with the fore-wheel, and this is done by means of screws, *c*, *c*, which pass through the end bearings of the frame into the axle of the wheels. The last improvement proposed is a horse-hoe, or drill-harrow, with peculiarly formed tines attached to the frame-work, as seen in fig. 10. One of these tines has been shown at fig. 9, and before alluded to, as designed to permit the stubble to rise over its top, and thereby to relieve the hoe or harrow from choking. At the sides of

this hoe scufflers are introduced, their extremities being formed like shares for the purpose of cutting away obstructions.

The inventor has, we understand, received testimonials from a number of highly respectable agriculturists, expressing their unqualified approbation of the efficacy with which these ploughs performed when employed upon rough and unbroken ground, for which they are particularly designed: and the manner in which they throw off the stubble, permitting those obstructions to escape without clogging the progress, is obviously calculated to diminish the labor of draught, as well as perform clean work.

2. Other harrows are exhibited, AGRICULTURE, plate II., as the first, or tusset harrow, and second, or fallow, with their teeth separately underneath. Then follow the double seed and chain and screw harrows. By mistake the plate containing the common and iron seed harrows has been numbered plate II. of AGRICULTURE, as well as that containing the ploughs; but the figures with these inscriptions speak sufficiently for themselves. The field roller of this plate is a very useful instrument: its weight being of course adapted to the land.

Harrows have not undergone much improvement in their construction; the principal point in which they have been rendered more beneficially applicable and convenient for use, appears to be in the form of the frames; the method of attaching the draught; the position and manner of fixing in the tines or teeth; and the directions of the bulls or solid parts.

It has been justly hinted by a late writer that there is no one harrow, whatever the nature of its construction may be, that can be applicable to every description of soil, or which can operate with equal effect and advantage on such lands as are rough and smooth, loose and solid, &c. It is necessary that they should constantly be fitted to the particular nature of the soil, and the peculiar uses to which it is devoted.

In the lighter sorts of ground, it is obvious that smaller and lighter sorts of harrows, with shorter teeth, may more fully answer the purpose than in such as are strong, heavy, and tenacious, or which have been lately broken up from the state of old sward, and that of common moor heath, and other sorts of waste, where they should have much greater weight and length of tines. It is frequently the practice, where the soil is rough and stubborn, as in some instances of following stiff clayey lands, to unite two common harrows together, in order more completely to reduce and break down the lumpiness of such grounds. And in the view of effecting these purposes, especially where the soil is stiff, adhesive, and much matted with weeds, it has been found advantageous not to have the harrows too thickly set with tines, by which they are liable to become choked up, and prevented from working in a proper manner.

The hitching or riding of harrows upon each other it has been attempted to remove, by having them constructed with running bulls, which are said to answer the purpose. It has also been suggested that inconveniences of this nature may be obviated by the mere fastening of the different

harrows together by means of hooks and eyes, or what in some places are called coupling-irons; as in this way the different harrows are only suffered to rise and fall at the same time.

3. *Lester's cultivator* of our (second) plate II. AGRICULTURE, is a fine implement amongst the variety that have been suggested as pulverisers of the soil. The scuffler is of similar character and use. But the grubber, RURAL ECONOMY, plate II. fig. 2, is thought an improvement on both.—All the coulters but two are fixed in the bars; these two are placed in the side beams of the outer frame, and may be said to go more or less deep by pins and wedges. Land on which potatoes or turnips have grown, or that has been ploughed in autumn or winter may be so stirred by this instrument that a crop may be sown in spring without further use of the plough. Beans and pease have been thus sown in spring, says Mr. Cleghorn, on the winter furrow, after being stirred by the grubber: and barley also, after turnip, without any ploughing. In working fallow it is used with good effect.

4. The heavy roller of our (second) plate II. AGRICULTURE has been improved upon, in a compound or spiked roller, and in the roller and water-box, plate III. RURAL ECONOMY, fig. 1, of which latter a representation is given. The spiked roller is employed in working fallows, or preparing stiff bean land for wheat. In stiff clay-ground, when ploughed dry, or which has been much trod upon, the furrow-slice will rise in large lumps, or clods, which the harrow cannot break. In this state of the ground, the rollers commonly used have little effect. Indeed, the seed is often buried in the ground, observes Mr. Loudon, by the clods being pressed down upon it by the weight of the roller. 'To remedy this, the spike-roller has been employed, and found very useful; but a roller can be made, which, perhaps, may answer the purpose better than the spike one. This roller is formed from a piece of hard wood, of a cylindrical form, on which are placed several rows of sharp-pointed darts, made either of forged iron, or cast metal. These darts, by striking the hard clods in a sloping direction, cut or split them into small pieces; and, by this means, they must be more easily pulverised by the harrow.'

5. The best, and, as Mr. Loudon says, 'the essential drill machines, are French's for turnips, Cooke's for corn, and the drill attached to a plough for beans.'

Mr. French was an agricultural mechanic of Northumberland, who first suggested the great improvement of concave rollers in the drill machine. Since it has been usual to sow pulverised manure with turnip seed, two hoppers (*h*) (*h*) have been added to his invention. See plate III. fig. 2.

Cooke's improved drill and horse-hoe is shown in fig. 3, plate III. It can be used as cultivator, hoe, rake, &c. It is in general use in Norfolk, Suffolk, and various other parts of England. Its advantages are said to be, 1. That the wheels are so large that the machine can travel on any road without trouble or danger of breaking; also from the farm to the field, &c., without taking to pieces. 2. In the

coulters, with all the coulters, moving with great ease, on the principle of the pentagraph, to the right or left, so as to counteract the irregularity of the horse's draught, by which means the drills may be made straight: and, where lands or ridges are made four and a half or nine and a half feet wide, the horse may always go in the furrow, without setting a foot on the land, either in drilling or horse-hoeing. 3. In the seed supplying itself regularly, without any attention, from the upper to the lower boxes, as it is distributed. 4. In lifting the pin on the coulters-beam to a hook on the axis of the wheels; by which means the coulters are kept out of the ground at the end of the land, without the least labor or fatigue to the person who attends the machine. 5. In going up or down steep hills, in the seed-box being elevated or depressed accordingly, so as to render the distribution of the seed regular; and the seed being covered by a lid, and thus screened from wind or rain. The bean drill attached to a plough is shown fig. 4.—It can be fixed in the handles of any common plough.

The interval between the rows of drilled turnips, potatoes, and beans and peas, admit the employment of a horse-hoe, or hoeing-plough. Of this kind of machine there are many varieties. A very good one is described in the Northumberland Report (p. 43). The body is of a triangular form, and contains three coulters and three hoes, or six hoes, according to the state of the soil. A hoe of the same kind is sometimes attached to a small roller, and employed between rows of wheat and barley, from nine to twelve inches distant; it is also used in place of a cultivator, in preparing bean stubbles for wheat in autumn, and for barley in spring. For THRESHING and WINNOWER MACHINES, see those articles

ADDENDA.

We hoped (see our article AGRICULTURE) to advert at this period of the publication of our work to a more satisfactory adjustment of the corn question by the government.

At present (1829) we have only seen another temporary and tampering expedient resorted to in the shape of a new corn bill which we believe satisfies no party. We consider this, therefore, still an adjourned question; and shall only add some miscellaneous observations on its importance. We are indebted to a pamphlet published at the period of the passing of the corn bill of 1815 for the following observations:—

1. *On the variations in seasons, and their effects on agricultural productions.*—Although the price at which productions will sell is in some measure regulated by the proportion betwixt demand and supply, yet it is by no means in the ratio of the excesses to the demand in times of superabundance, or in the ratio of deficiency to demand in times of scarcity. Thus, if the demand be as ten, and the supply as eleven, the price will be depressed more than ten per cent. If, on the other hand, the demand be as ten, and the supply as nine, the price will be raised more than ten per cent. If the demand continue the same, and the supply be as twelve, the price to which the production will be reduced will be far more

than ten per cent. lower than it would have been with a supply at eleven.

It will not be necessary to carry this illustration farther, though it will be obvious that, in the case of excess of supply beyond demand, the depreciation will be much greater in a commodity that is quickly perishable, than in one that will retain its properties for a long period. Even in articles that lose none of their virtues by being preserved, but from their bulk require considerable space, the depreciation will be greater than in those which are more easily removed or stored at less expense. Thus potatoes have felt a much greater depreciation than wheat from their perishable nature; and, from being bulky, when raised at a distance from a large town or a populous district, they have not borne even the expense of conveyance to the consumers. The prices of commodities are also influenced in some measure, and occasionally in a considerable degree, by the prevalence of public opinion, as to the proportion between demand and supply; and, in articles of the first necessity, to a greater extent than in those of inferior consideration. This influence, however, is of a transient kind; and the opinion on which it is grounded is generally corrected before any very injurious effect is produced.

From the great variety in soil and climate within this island, the produce of our harvests generally does not vary so much as a slight observer would suppose. The wet seasons, which are injurious to our cold and heavy soils, are beneficial to those of the opposite description; and a summer of great drought, which parches the lighter soils, and lessens their productions, increases those of the heavier soils. There will, however, be variations in productiveness, but usually not to a great extent. Perhaps on a large average of years, not including one or two of very uncommon character, it will be found that, taking the standard as twenty, in the best years their production may have reached twenty-three, and the worst, not fallen short of seventeen; and that most of our harvests have been at some period between seventeen and twenty-three. If the views we have taken be tolerably correct, we may presume that for the past twenty years, if our production has been as twenty, our consumption may be estimated as twenty-one; and this estimate will be confirmed by the excess of our importation beyond our exportation of corn for that period, as shown by the public documents.

Previously to the year 1811 there had been for several years a gradual increase in the prices of corn, such as must have happened if, as in every other country, the population had a little preceded in its march the production of food. This increase had given a stimulus to agriculture; the capital which had accumulated in that branch of industry had been invested in making further improvements; some extraneous capital also was attracted into the same channel, and in consequence a greater portion of labor was exercised in cultivation than it had before received. The harvest of 1811 was miserably deficient; and, before one half of it was threshed, the deficiency became obvious; prices rose with rapi-

dity, and to a height scarcely ever known before. The advance in price came too late to produce much influence on the ensuing harvest. Some spring wheat indeed was sown; but its effect in aiding national subsistence was trifling, as the same land would probably have produced more food, if, as usual, barley, and not spring wheat, had succeeded to turnips.

The deficiency of the harvest of 1811 was not made up by that of 1812, which probably reached the average of our usual production, or one-twentieth less than our consumption. The same price thus continued, and, appearing to be almost permanently fixed at a rate that would pay the most expensive cultivation, it gave a stimulus to still greater agricultural exertions; no cost was spared in the purchase of manures; every portion of land capable of bearing corn was appropriated to that purpose; the usual and regular courses of cropping were generally deviated from; and a breadth of land sown, far exceeding what had ever before been done. Potatoes, which had borne a higher relative price than corn, were cultivated also to an extent before unknown.

The year 1813 proved highly propitious; all the different species of corn were favored by the seasons, whose variations seemed exactly executed as if to promote abundant vegetation; the weather whilst harvesting this crop was unusually favorable; and this bountiful supply, housed under such happy circumstances, proved as good in quality, as it was excessive in quantity. But the impression of its abundance upon the public exceeded the reality.

It is extremely difficult to estimate the quantity of excess in this year of singular character. As far as pretty extensive enquiry, and not inattentive observation, may enable us, we may attempt the calculation without the fear of erring very materially. Most of the farmers on poor lands, whose usual growth of wheat had been twenty bushels to the acre, in that year allow that their growth amounted to from twenty-four to twenty-five bushels; those on better lands usually producing twenty-four to twenty-six, produced from thirty to thirty-two bushels, and on the very best wheat lands some have stated their excess above the usual production to amount to eight bushels. Allowing difficulty of accuracy, and requesting that indulgence which the nature of the case requires, it will not be deemed presumptuous to estimate this great production at twenty-six, taking, as before, the average production as twenty, and the consumption as twenty-one: this will account, if tolerably accurate, for an enormous depreciation in price. The happy events which led to the peace followed each other in quick succession. Soon after our harvest was securely housed, the foreign ports were opened as well as our own, and a large importation of foreign corn was made. The words peace and plenty have been so commonly joined together that the public expected some union by which one must necessarily produce the other; as if a magical operation was to be performed by the cessation of war, by which either the earth was to become more fertile, or the physical necessity for food become lessened.

Partly from the clamors of the populace, partly

from the state of the foreign exchanges, and, perhaps, partly because the measure originated with their political opponents, the alterations in the corn laws, which it was afterwards found necessary to make, were protracted by ministers till the greatest mischief was effected; and then, when too late to be of any service, they were enacted amidst as much popular confusion as could have happened had it been done at the proper period.

Notwithstanding the surplus quantity of corn produced by the harvest of 1813, the markets would not have been so ruinously depressed if the law had protected the grower early against the foreign competitors. A sufficient number would have retained their stock, or at least a part of it, till a more distant period; but, seeing no check on the foreign corn, and dreading a larger quantity than even could be imported, each rushed to the market, the produce rapidly fell, till at last it seemed permanently settled at a price from thirty to fifty per cent. below its actual cost. Those farmers who were obliged to sell, and who are the far greater proportion of the body, when they wanted money to pay their rent, taxes, and laborers, were under the necessity of selling a double quantity, to realise the usual sum; and thus a glut was produced, which has been attended with the most serious consequences. The harvest of 1814 was by no means abundant in quantity, and the quality of the wheat was so bad in general, and yielded so little flour, that it may be fairly estimated below the average rate of our production. The surplus of the preceding great harvest, and the quantity imported, which was increased by the expectation that the corn bill would raise the price, were sufficient for the consumption of the year, but left a very small stock on hand to meet the future wants of the country. The harvest which followed, in 1815, was a month earlier than our harvests usually are; and from the surplus of the great harvest, from the imported quantity, and from the harvest of 1814, instead of twelve not more than eleven months' provision had been consumed, when the next harvest commenced.

The very low price at which wheat was sold, now increased the consumption very considerably; and the inferior qualities of it, which would produce but little at the market, were used for fattening cattle, and for other purposes to which wheat was never applied before. Thus a degree of profusion in the use of it has rendered the surplus quantity of little avail towards supplying any future scarcity that may occur.

The harvest of 1815, which has been before stated to have taken place a month earlier than usual, found us with a small quantity of foreign wheat of an indifferent quality in the granaries at the sea ports, and but a small stock in the hands of the grower, probably not more than sufficient for our consumption to the usual period at which our corn is harvested. The productiveness of the harvest of 1815 most certainly was below the average of our consumption, at least if the whole may be judged of from the southern parts of the island; but still the markets became lower, not from abundance, but from the impoverished condition of the cultivators. At an unusually

early period a great quantity of new corn was produced in the markets; the pressing demands for money could only be met by sacrificing at less than half the cost the greater part of the year's production and even that became insufficient to satisfy only the most pressing wants; the inferior wheats could not be sold at any rate; the prices were so low that only wheat of the best quality would suit the palates even of the poor; and accordingly at this early period there is felt a scarcity of the finest kinds of wheat. The same profusion of the inferior descriptions has continued; and the probability is that, before the harvest arrives, a sensible deficiency will be discovered. Thus from the alarm produced by an expectation of enormous importation of foreign corn, added to a surplus at home, our own prices have been reduced so low as to bring ruin on many cultivators, and a loss of capital to all, which, whatever may be the future demand, must prevent them from bestowing on the land that labor which can alone enable it to produce nearly sufficient for our subsistence.

If the corn-bill (of 1815) passed in the last session of parliament, had been enacted when it was first proposed, it is probable that the price would have been kept at nearly its cost, notwithstanding the surplus quantity. The general profusion in the use of corn would not have taken place; some of the surplus would have been stored to meet future periods of scarcity; and the land whose culture is now slighted, and neglected, would have been kept up to that full power of production, which is now from the loss of capital gradually diminishing.

2. *On the present and future effects of the depression of agriculture.*—It is not unusual to hear those who have paid but slight attention to the nature of agriculture express their surprise that a year or two of actual loss, should be productive of so much distress as is complained of at present; especially when following years in which the cultivators have gained large profits. They ask, cannot those who during several years have gained on the amount of their capital a larger share of profit than other members of the community endure the discontinuance of that profit, or even some loss, without suffering more than has been inflicted on their neighbours?

It may not be amiss in the first place to remark that, in those years in which the produce of the land has borne the highest prices, they have seldom been very much raised till a large part of the growth of the more numerous portion, the poorer farmers, had passed from their hands into those of the corn merchant, the factor, or the meal-man; and, therefore, those who most needed have been the least benefited by such high prices. The fact is that the smaller class of farmers are under the necessity of selling their produce early; long before the deficiency is apparent; and therefore never can have the full benefit which the richer part of the profession, the smaller number, may sometimes gain. Very high prices of produce, such as were obtained three or four years ago, have been occasioned by crops deficient either in quantity or quality; and then such advanced prices amounted to but little more on the whole growth

of the year, than a good crop would have produced at lower prices.

Whatever gains have been made in prosperous years by the great mass of cultivators, however much they may have increased their substance during those years, it has not usually been diverted into other channels than that in which it has been acquired. It has generally been expended either in improving the soil already under cultivation, or in preparing land, before in a neglected state, to bear the most valuable crops. Thus this increase of property, added to what they had before invested in agriculture, has only increased their loss. It is almost needless to state that all land recently brought into cultivation, instead of repaying any part of the capital expended upon it, or even any interest, has not paid the annual expenses of seed, labor, and taxes; and the loss has been equal to the capital expended, and the annual rent. It will thus appear that a series of years of moderate prosperity and accumulation, if that accumulation has been re-invested in the soil, is not a compensation equivalent to the disastrous events which the two last years have produced; in which probably the whole rental of the corn land in this kingdom has been paid (as far as rents have been paid), not out of the profits, but out of the capital of the cultivators.

The first of the evils, a long train of which must follow, has fallen on the laboring poor, whose wages, indeed, have not been lessened to the full extent of the reduced prices of the produce of the land, and who, could they obtain employment, would have no great reason to complain; but their sufferings arise from the scarcity of labor. The farmer has no means, and no inducement to employ laborers, the cost of whose labor is greater than he can hope to be paid for; and should corn now become higher in price, the greater part of his growth being sold, he would still be unable to pay those whom, excited by hopes of further improvement, he might wish to employ.

At no period in the memory of man has there been so great a portion of industrious agricultural laborers absolutely destitute as at the present moment. They cannot procure employment, and parochial relief is doled out with a scanty hand, by those who want even the pittance that is bestowed to pay the few workmen they are obliged to employ. This evil is not likely to be lessened, but, on the contrary, must increase as the capital of the farmers approaches nearer to annihilation. To them it will be of no consequence that labor is cheap, and corn scarce. The capital, which by setting in motion the labor would increase the quantity of corn grown, is departed, and a long period must elapse before it can be again collected. The mechanics and tradesmen, whose principal dependence was on the agriculturists, and who form a very large proportion of the kingdom, are in a situation not much better than the laboring poor. Their best customers can scarcely employ them; and for the little trade they have, instead of being paid with punctuality as heretofore, they are glad to receive a very small proportion, and defer the remainder to a future period. This

evil extends to all the other classes not immediately dependent on the agriculturists; and it would be difficult to point out a single branch of industry that is not suffering under the influence of the general depression.

The higher classes of the community, the landed proprietors, whose wealth and rank are as beneficial to the poor as to themselves, must suffer in their revenues and their comforts, as well as in their feelings. They have been warranted in living very nearly up to their annual incomes; and, in general, cannot be capable of very great retrenchments, without denying themselves many luxuries, and even comforts, in the furnishing of which numerous members of the community have found the means of subsistence. It is notorious that rents cannot be paid, except in a few partial instances; that, as the capital of the tenants is diminished, their means of paying must become lessened; and, for many extensive portions of land, no tenants will be found who have the means of cultivating them. Thus that important class, the pillars and the ornaments of our country, are already in some degree, and must more extensively hereafter become sharers in the general calamity.

This slight sketch of the evils which have already resulted from the depression of agriculture, and whose extent must be yet increasing, is by no means overcharged. The subject is too painful, or it might be much enlarged. Alarming, however, as this representation is, it is by no means equal to those which the future presents. The distress of the agriculturists has been stated to have already diminished the labor applied to the land. The withdrawing of the labor will diminish the produce; and if the opinions before stated, of the proportion between our supply of food and our consumption, be nearly correct, a very small diminution in our produce, which is already begun, and will surely continue, must reduce the community to a state approaching to famine.

It may appear ridiculous, to those who suppose we are overloaded with food, to talk of approaching famine: they may think that, having already too much corn, we shall never again feel a deficiency of that necessary article: but let it be considered that, during twenty years, we have regularly, with one exception, felt a deficiency; that in the whole of that period, if not rapidly, our agriculture was regularly increasing, whereas now it is at least as rapidly on the decline; that many producing farms are now absolutely and totally without cultivation; that the number of such farms is daily increasing; that the land which has hitherto enjoyed its full portion of labor is deprived of the greater part; and that the population has increased, and will continue to do so till it is checked by a scarcity of food. If these facts are correct, and it is scarcely possible that they should be controverted, the time cannot be very distant when our cultivation will be so much diminished, that after a harvest but a little below the ordinary rate of productiveness, our deficiency in corn must be too great for any surplus in foreign countries to supply our wants, however high the price we may offer for it.

If it be true that at the commencement of the last harvest there was not a surplus of wheat sufficient to supply us for more than a month; that the produce of the last year was below the average of twelve months' consumption; that, unless the next harvest happens as early as the last, thirteen months' consumption will be requisite; that from the distress of the farmers the markets early became overloaded, and were depressed to a price that created profusion in the use of wheat; that the cultivation of potatoes, that useful substitute for wheat, has, from the losses sustained, nearly ceased, except in the vicinity of large towns or populous districts; and if we consider that the price of wheat is in most parts of Europe so high as to indicate a scarcity rather than a surplus, we may conclude that a considerable degree of want will prevail before any new wheat is produced. If such scarcity should happen, and a probability appear of such a price being maintained as will repay the expense of cultivation, those who have not quite exhausted their powers may continue the growth of corn to a moderate extent; but, should it happen that the present depression continues, the prospect will be gloomy indeed; the great number of cultivators who will have been driven from the occupation, the increased quantity of land without culture, and the slovenly manner in which what is cultivated will be managed, must produce scarcity, famine, and depopulation.

These observations may be thought a little antiquated, but we conceive most of the reasoning applicable to the present state of agricultural affairs: and cannot better conclude than by the following brief statement of the drawbacks and improvements in agriculture, suggested by another able writer, Mr. Clegborn, in the article we have already been much indebted to, *Agriculture*, Supplement to the *Encyclopædia Britannica*. 'To the class of drawbacks upon agriculture,' says this writer, 'and impediments to its improvement, belong tithes,—poor-rates,—payments in the shape of fines, and services exacted by the lords of manors—entails—tenancy at will, or on very short leases—unfair restrictions on the tenant as to the disposal of his lease, and as to the management of the lands during its currency—the game laws—and the complicated regulations under which commons and common fields are

cultivated, and the great expense required to place them in a state of severalty. It appears that nearly three-fourths of the land of England and Wales are exposed to claims which wrest from the husbandman one-tenth of the gross produce of his labor and capital, and this whether the remainder of the produce be or be not sufficient for his remuneration. Though no rent were paid for poor soils, this burden alone would effectually prohibit their correct cultivation; and, even in the case of rich soils, tithes diminish the rent so considerably, as to make it the interest of landholders, in many parts of England, to restrain their tenants from converting grass lands into tillage; that is, from placing them under the most productive management for the community, both in regard to the supply of food and of employment.

'To the enlightened enquirer it must appear abundantly clear that all plans for the extension and improvement of British agriculture must prove ineffectual, so long as these capital obstacles are left untouched; and that their removal is all that need be done, and all that ought to be done by a wise government, for securing an abundant supply of the first necessities of life. Let all land be held and occupied in severalty—let it be exempted from all indefinite exactions, particularly such as diminish, or altogether absorb the just returns of capital and industry—let the connexion between the land proprietor and the farmer be every where formed upon equitable principles to the exclusion of all remnants of feudal ideas, all notions of favor and dependence, and all obligations that do not appear within the four corners of the lease itself, or are not imposed by the general principles of law—let the rights of a tenant be so far enlarged as that he may be enabled at pleasure to withdraw his capital by a transference of his lease, and to regulate the succession to it after his death—then there can be little doubt that a large part of the disposable capital of the nation, now embarked in much less profitable pursuits, would, of its own accord, turn towards the improvement of our lands; and thus furnish employment and subsistence for our population, secure from the caprice of fashion, and the rivalry and jealousy of other countries.'

RUSCUS, knee-holm, knee-holly, or butcher's broom, a genus of the syngenesia, and diœcia class of plants; natural order eleventh, sarmen-taceæ: MALE CAL. hexaphyllous: COR. none, nectarium central, ovate, and perforated at the top: FEMALE CAL. COR. and nectarium are the same as in the male; there is one style, with a trilobular two seeded berry. The most remarkable species is the

R. aculeatus, or common butcher's broom, common in the woods in many parts of England. It has roots composed of many thick fibres which twine about each other; from which arise several stiff green stalks about three feet high, sending out from their sides several short branches, garnished with stiff, oval, heart-shaped leaves, placed alternately on every part

of the stalk, ending with sharp prickly points. The flowers are produced in the middle, on the upper side of the leaves; they are small, and cut into six parts; of a purple color, sitting close to the midrib. They appear in June; and the female flowers are succeeded by berries as large as cherries, of a sweetish taste, which ripen in winter; when they are of a beautiful red color. As this plant grows wild in most parts of England, it is rarely admitted into gardens; but, if some of the roots are planted under tall trees in large plantations, they will spread into large clumps; and, as they retain their leaves in winter, at that season they will have a good effect. The seeds of this plant generally lie a year in the ground before they vegetate; and the plants so raised are long before

they arrive at a size big enough to make any figure, and therefore it is much better to transplant the roots. The root is accounted aperient, and in this intention is sometimes made an ingredient in apozems and diet drinks, for opening slight obstructions of the viscera and promoting the fluid secretions. This plant is used by the butchers for besoms to sweep their blocks.

RUSE, *n. s.* Fr. *ruse*. Cunning; artifice; little stratagem; trick. A French word, says Johnson, neither elegant nor necessary.

I might here add much concerning the wiles and *ruses*, which these timid creatures use to save themselves. *Ray.*

RUSH, *n. s.* } Sax. *pire*; Teut. *rusch*;
RUSH-CANDLE, } Goth. *raus*. A plant: the
RUSHY, *adj.* } compound and adjective
follow the noun-substantive in sense.

He taught me how to know a man in love; in which cage of *rushes* I am sure you are not prisoner. *Shakspeare.*

Man but a *rush* against Othello's breast,
And he retires. *Id. Othello.*

Be it moon or sun or what you please;
And if you please to call it a *rush-candle*,
Henceforth it shall be so for me. *Shakspeare.*

If your influence be quite dammed up
With black usurping mists, some gentle taper,
Though a *rush-candle* from the wicker hole
Of some clay habitation, visit us. *Milton.*

Your farm requires your pains;
Though *rushes* overspread the neighbouring plains. *Dryden.*

Not a *rush* matter, whether apes go on four legs or
two. *L'Estrange.*

In *rushy* grounds, springs are found at the first
sight. *Mortimer.*

John Bull's friendship is not worth a *rush*.
What knight like him could toss the *rushy* lance? *Arbuthnot.*
Tickell.

The timid hare to some lone seat
Retired; the *rushy* fen or rugged furze. *Thomson.*

A *rush* hath a flower composed of many leaves,
which are placed orbicularly, and expand in form of
a rose: they are planted with great care on the
banks of the sea in Holland, in order to prevent the
water from washing away the earth; for the roots of
these *rushes* fasten themselves very deep in the
ground, and mat themselves near the surface, so as to
hold the earth closely together. *Miller.*

RUSU, *v. n. & n. s.* Sax. *preoran*. To move
with violence; go on with tumultuous rapidity;
violent course or motion.

Their dam upstart out of her den afraide,
And *rushed* forth, hurling her hideous taile. *Spenser. Faerie Queene.*

Gorgias removed out of the camp by night, to the
end he might *rush* upon the camp of the Jews. *1 Mac. iv. 2.*

A gentleman of his train spurred up his horse,
and with a violent *rush* severed him from the duke. *Wotton.*

Him while fresh and fragrant time
Cherish in his golden prime,
The *rush* of death's unruly wave
Swept him off into the grave. *Crashaw.*
Armies *rush* to battle in his clouds. *Milton.*

Desperate should he *rush*, and lose his life,
With odds oppressed. *Dryden's Æneis.*

They will always strive to be good christians, but
never think it to be a part of religion to *rush* into
the office of princes or ministers. *Sprat.*

You say, the sea

Does with its waves fall backward to the west,
And, thence repelled, advances to the east;
While this revolting motion does indure,
The deep must reel, and *rush* from shoar to shoar. *Blackmore.*

With a *rushing* sound the assembly bend
Diverse their steps. *Pope's Odyssey.*

RUSH, in botany. See JUNCUS.

RUSH, SWEET. See ACORUS.

RUSHWORTH (John), was born in Northumberland about 1607. After attending the university of Oxford, he removed to Lincoln's Inn; and attended the meetings of parliament, where he wrote down the speeches of the king and members. During eleven years, from 1630 to 1640, when no parliament was held, he was an attentive observer of the great transactions of state in the star-chamber, the court of honor, and exchequer chamber. He also visited the camp at Berwick, was present at the battle of Newborn, at the treaty of Rippon, and at the great council of York. In 1640 he was appointed assistant to Henry Elsynge, clerk to the house of commons; and the commons trusted him to convey their overtures to the king, while he was at York. When the parliament created Fairfax their general, Rushworth was appointed his secretary; and, when Fairfax resigned his commission, Rushworth returned to Lincoln's Inn, and was soon after chosen one of the committee to consider the propriety and means of new-modelling the common law. He was elected a representative for Berwick-upon-Tweed to the parliament which Richard Cromwell assembled in 1658, and was reelected to that which restored Charles II. to the crown. After the restoration he delivered to the king several books of the privy council, which he had preserved during the commotions. Sir Orlando Bridgeman keeper of the great seal chose him his secretary in 1677, which office he held as long as Sir Orlando kept the seals. In 1678 he was a third time chosen member for Berwick, and a fourth time in the parliament in 1679. He was imprisoned in the King's Bench for the last six years of his life. He died 12th of May, 1690. His Historical Collection of Private Passages in State, weighty Matters in Law, and Remarkable Proceedings in Parliament, was published in folio. The first part appeared in 1659; the second in 1680; the third in 1692; the fourth and last was published in 1701; and altogether made 7 vols. These underwent a second edition in 1721; and the trial of the earl of Strafford was added, which made the eighth. This work has of course been much applauded by those who condemn the conduct of Charles I., and accused of partiality by their opponents.

RUSK, *n. s.* Arm. *ruzg*. Hard bread for stores.

The lady sent me divers presents of fruits, sugar, and *rush*. *Raleigh.*

RUSMA, in natural history, is the modern name of the eastern nations for the substance called by the ancient Greeks sory, and used as a depilatory. The Turks in particular call this substance *rusma*. It is not, as some have imagined, a mineral substance found ready for use, in the

bowels of the earth; but requires a preparation and alloy. Bellon, who first described at Cuta, in Galatia, 'the source of a mineral which they call rusma,' adds that this mineral alone cannot be used 'till it has been beaten into a very fine powder, putting half as much quicklime as rusma, which is then diluted in a vessel with water.' Thus the rusma of Bellon is not of itself a depilatory; but it contains some caustic matter, which being mixed with lime gives it that property. This presumption is confirmed by Velmout de Bomare, who, having received from Constantinople some small pieces of mineral rusma, perceived that, on throwing it upon hot coals, there immediately exhaled from it a vapor, which gives reason for suspecting that it is a 'colchitis' mineralised by sulphur and arsenic. This mixture is the true rusma of the Turks, and the nouret of the Arabs. Boyle tells us he made a fine powder of equal parts of rusma and quicklime, and, letting them soak a little time in water, they became a soft paste, which he spread on the part he would free from hair; and, after letting this paste lie on about three minutes, he wiped it off with a wet cloth, and found the hair taken away by the roots without any inconvenience.

RUSSEL (Alexander), M. D., was born and educated at Edinburgh. He became physician to the English Factory at Aleppo. In 1775 he published a History of Aleppo, which was much esteemed, and has since been reprinted, and translated into different languages. He returned to England in 1759, and became physician to St. Thomas's hospital. He died in 1770.

RUSSEL (Lord William), an illustrious British patriot, the third son of William, first duke of Bedford, was born in 1641. In 1667 he married Rachael, second daughter of Thomas Wriothley, earl of Southampton, and widow of lord Vaughan, a lady of distinguished talents and piety. Having obtained a seat in the house of commons, he took part with the whigs, and opposed the succession of James duke of York, with great zeal. He afterwards entered into various schemes for excluding that prince, for which he was indicted and tried at the Old Bailey, by a venal court, and a packed jury who found him guilty; and he was beheaded at Lincoln's Inn Fields, July 31st, 1683. In 1689 the house of lords passed an act, reversing his attainder. His lady survived him several years, and a volume of her correspondence with some of the most eminent personages of that age has been published. See GREAT BRITAIN.

RUSSELLIA, in botany, a genus of the digynia order, and pentandria class of plants: CAL. five-leaved: COR. two-lipped; petals five above: CAPS. one-celled and many seeded. Species one only, a climber of Havannah.

RUSSELL (Thomas Macnamara), esq., admiral of the white, was descended, on both sides, from most respectable families. His father (an Englishman) went over to Ireland, where he married a lady of that country, and settled. Mr. Russell was born, we believe, about the year 1743, and his Christian name Macnamara was derived from his paternal grandmother. At the early age of five years, he had the misfortune of

losing his father; and, through either the fraud or mismanagement of his guardians, all the fortune which had been left him was dissipated by the time that he reached fourteen. Our officer entered the service at an early period; and, after serving fourteen years as midshipman, was promoted to the rank of lieutenant. During the war with the colonies he served on board the Albany, Diligent, and Raleigh, principally on the coast of America, and distinguished himself on several occasions. The pilot having once run the Albany upon a rock, at some distance from the land, to the westward of the bay of Fundy, lieutenant Russell requested and obtained from his commander the Albany's boats, armed with volunteers, to cruise for vessels to lighten and get her off; or, should that be impracticable, to save her stores, and to cover their own retreat to Halifax. In the course of seven or eight hours he returned, with no fewer than four fine sloops and schooners, some laden and some in ballast, which he had cut out from under a very heavy fire from the shore.

From the Albany Mr. Russell was removed to the command of the Diligent brig, of eight three-pounders. In this ship, whilst cruising off the Chesapeake, he engaged and took the Lady Washington, letter of marque, of sixteen six-pounders, richly laden, from France. Mr. Russell now became first lieutenant of the Raleigh, commanded by captain (afterwards admiral) Gambier. In this ship he was engaged in repelling the French attempt upon Jersey (under the command of captain Ford and Sir James Wallace) in 1779.

After this service lord Shulldham, then port admiral at Plymouth, honored lieutenant Russell with the command of Drake's Island, with 200 or 300 seamen and marines. His lordship flatteringly termed this the Post of Honor; it being, as he observed, the advanced post of Great Britain, whilst the combined fleets kept the channel. Lieutenant Russell next served in the Raleigh, at the siege of Charlestown; on the reduction of which (May the 11th, 1780) vice-admiral Arbuthnot, the naval commander-in-chief, promoted him to the rank of master and commander in the Beaumont sloop.

From the Beaumont sloop, captain Russell was made post in the Bedford, of seventy-four guns, then bearing the broad pendant of commodore Affleck. He soon after removed into the Hussar, of twenty guns; in which ship he cruised successfully against the enemy, by taking and destroying a large frigate near Boston, laden with masts and naval stores, for the French fleet; a large brig privateer, of eighteen guns; a letter of marque, of nearly the same force; and several smaller prizes, beside the Sybille frigate, the capture of which demands more particular notice.—The Hussar had only twenty guns, and 116 men, thirteen of whom were on the sick list; but La Sybille had thirty-eight guns, and 350 men; circumstances which rendered the odds far greater in favor of the Frenchman.

Captain Russell's official letter says, 'On my approach, she displayed an English ensign reversed in her main shrouds, and English colors over French at the ensign-staff. Having like-

wise discovered that she was under very good jury-masts, had some shot-holes in her quarter, and not supposing that French tactics contained a *ruse de guerre* of so black a tint, I took her to be what her colors intimated—a distressed prize to some of his majesty's ships; every hostile idea vanished; my mind was employed in devising means to succor and protect her; I declined the privilege of my supposed rank, and stood under his lee to hail. At that moment, by a pre-concerted and rapid movement, he put up his helm, aimed at laying me athwart hawse, carrying away my bowsprit, raking, and then boarding me. I felt the error of my credulity; ordered our helm hard-a-weather, shivered, and shortened the after-sails. The Hussar obeyed it—saved me from the murdering reflection of a surprise—baffled in part the enemies' attention, and received only a half-raking fire; which, however, tore me to pieces forward, and killed two of my men. By this time both ships were by the lee forward, and almost aboard each other. I called aloud, to stand by to board him. It had the desired effect; he put up his helm—wore off—the Hussar closed with him—and a fair engagement commenced before the wind. After about two hours' chase, the Hussar got up abreast of the enemy, gave him one broadside, which he returned with two guns, and struck his colors; the Centurion, then about long random shot astern, and the Terrier sloop about four or five miles to leeward, under a pressure of sail. The French officers, when prisoners, confessed that it was their intention to put the crew of the Hussar to the sword for daring to chase them in so contemptible a ship.

From the circumstance of peace taking place just at that period, the above letter was never published. Perhaps, also, from motives of conciliation on the part of Great Britain, it was thought politic not to give it to the world, as it certainly bore extremely hard upon the French commander. But, as it was intended that this letter should appear at the court of France against count Kregarou, it became necessary to have it legally authenticated, which was accordingly done.

When the captain of la Sybille delivered his sword to captain Russell on the Hussar's quarter-deck, he commenced a speech, with much pomposity of style and manner, saying, 'Accept, Sir, of a sword, which was never before surrendered. Conceive my feeling, on being reduced to it by a ship of less than half my force but such a ship! such a constant and continued tremendous fire!'—Captain Russell answered, 'Sir, I must humbly beg leave to decline any compliments to this ship, her officers, or company, as I cannot return them. She is indeed no more than a British ship of her class should be. She had not fair play: but Almighty God has saved her from a most foul snare of a most perfidious enemy.' 'I receive your sword with the most inexpressible contempt; and, sir, you will please to observe, that lest it should ever defile the hand of any honest French or English officer, I here, in the most formal and public manner, break it.' At this moment a strong box, containing about £500, was brought on board the

Hussar, and another filled with plate, &c. The French officers in a body declared that the money was their private property, and that the plate belonged to their captain. 'Gentlemen,' said captain Russell, 'it shall continue yours; whatever your captain may think, British officers do not fight for money.' Attempts were made to bribe captain Russell to release the count; the English commander, of course, revolted at the offer, and severely reproved the bearer.

On his return to England, captain Russell, for his various services, was offered the honor of knighthood; an honor which he modestly declined, as not possessing a sufficient fortune. Some of his friends thought that this refusal might disoblige lord Keppel; but that it did not was evident from his lordship's continued friendship towards him whilst he lived.

During the peace, in the course of the year 1791, captain Russell was appointed to command the *Diana*, on the Jamaica station; where, for his conduct during the apprehension of a rising among the negroes, he was twice honored with the public thanks of the inhabitants. It was during this time that he was sent by admiral Affleck, to convoy a cargo of provisions, as an act of charity, from the government and principal inhabitants of Jamaica, to the white people of St. Domingo, who were then severely suffering from the depredations of the people of color. He was received with joy and gratitude; and was invited to a public dinner given by the colonial assembly at Aux Cayes. At this repast our officer represented to the assembly that there was a lieutenant Perkins, of the British navy, cruelly confined in a dungeon at Jeremie, on the other side of the island, under the pretext of having supplied the blacks with arms; but, in fact, through malice for his activity against the trade of that part of St. Domingo in the American war. Captain Russell stated that, before he had ventured to plead his cause, he had satisfied himself of his absolute innocence; that he had undergone nothing like a legal process, a thing impossible from the suspension of their ordinary courts of justice, owing to the divided and distracted state of the colony; and yet, horrible to relate, he lay under sentence of death! 'Grant me,' said captain Russell, 'his life! Do not suffer these people to be guilty of the murder of an innocent man, by which they would drag British vengeance upon the whole island.' So forcible was this appeal that the assembly, in the most hearty and unequivocal manner, promised that an order should be instantly transmitted for him to be delivered up. On the following day, however, on captain Russell sending an officer to receive the order for lieutenant Perkins's liberation, he returned with a refusal from the assembly; for, 'as it was a promise made after dinner, they did not think it binding.'

Almost at the moment of the officer's return, the *Ferret* sloop, captain Nowell (afterwards admiral Nowell), hove in sight. She had been at Jeremie, with despatches containing the requests of lord Effingham and admiral Affleck, that lieutenant Perkins might be delivered up, which the council of commons there absolutely refused. No sooner was captain Russell apprised of this state of the

business, than he declared that he would sacrifice as many Frenchmen as there were hairs on Perkins's head, if they murdered him. His determination was soon known amongst the Diana's crew; the anchor was up, sail crowded, and the wind favoring them in an uncommon manner, the frigate and sloop quickly appeared off Jeremie. Both of the vessels hove to close to the harbor, and prepared for battle; every soul on board of them panting for vengeance, should Perkins be murdered. Captain Nowell, on landing, was surrounded by a mob of at least 300 villains, armed with sabres; and, together with Lieutenant Godby, who accompanied him, had occasion to keep his hand on his sword during the whole of the conference which took place. The president read the letter, and said, 'Sir, suppose I do not?' 'In that case,' replied the British officer, 'you draw down a destruction which you are little aware of. I know captain Russell; beware, if you value your town, and the lives of thousands; he has given me sixty minutes to decide; you see, sir, that thirty of them are elapsed.' The mob now grew outrageous. 'You shall have him,' exclaimed one of them, 'but it shall be in quarters!' Captain Nowell instantly drew his sword, and, looking at the president, said, 'Sir, order that fellow out of my sight, or he dies!' The president did so; and, after a few more threats from captain Nowell, that he would return without him, poor Perkins was led from the brig of war lying off the town in which he had been kept a close prisoner, into the Ferret's boat.

Having remained the usual time on the Jamaica station, the Diana returned to England, and was paid off; after which captain Russell was appointed to command the St. Albans of sixty-four guns, and brought home four or five East Indiamen from St. Helena. On the 11th of January, 1796, he was appointed to the Vengeance, of seventy-four guns; in which he served in the West Indies, under rear-admiral Harvey, at the captures of St. Lucia and Trinidad, and at the subsequent unsuccessful siege of Porto Rico; and on this station captain Russell had the satisfaction of making, the second time in his life, an ample fortune; but, by an unlimited confidence in the integrity of others, his golden treasures soon vanished.

In the spring of 1799 he returned to England, and joined the Channel fleet, then under the orders of earl St. Vincent. Having remained for some time in that service, the Vengeance, being much out of repair, was paid off; and, on the 23d of April, 1800, captain Russell was appointed to the Princess Royal, a second rate, in which ship he remained until advanced to the rank of rear admiral of the white, Jan. 1st., 1801; and on

the 23d of April, 1804, rear-admiral of the red. Soon after the commencement of the late war, we find our officer serving under lord Keith. About the year 1807 he was appointed to the chief command of the North Sea fleet; but, from the rigid caution which the Dutch squadrons observed, no opportunity occurred for him to display the determined spirit which he was well known to possess. His promotion to the rank of vice-admiral took place Nov. 9th, 1805; and on the 12th of August, 1812, he became a full admiral. Mrs. Russell, to whom he was united about the year 1793, died March 9th, 1818, leaving an only child, a daughter, married in 1817 to George Edward Patey, esq., lieutenant. R.N.

Admiral Russell's blockade of the Texel, during the period of the threatened invasion of our shores, has been considered admirable, and was planned and executed by himself. His system of anchoring during the strongest gales, with sometimes three cables on end, was rewarded by the most complete success. During the neap tides, the line-of-battle ships for the most part rendezvoused at North Yarmouth, by which a saving to his country in wear and tear, and probable loss of ships, was effected to an immense amount. Indeed, while this blockade of the Texel was the most efficient ever known, and was conducted with all the rigidity of a state of bitter warfare, it was marked by instances of refined humanity which procured the respect and esteem of the Dutch admiral Kitchurch, his officers, and men.

RUSSET, *adj.* & *n. s.* Fr. *rousset*; Lat. *ruscus*. Reddish brown: such is the color of apples called russetings, and of coarse country dresses.

The morn, in russet mantle clad,
Walks o'er the dew of yon high eastern hill.
Shakspeare.

Taffata phrases, silken terms precise,
Figures pedantical: these summer flies
Have blown me full of maggot ostentation:
Henceforth my wooing mind shall be exprest
In russet yeas, and honest kersey noes. *Id.*

Our summer such a russet livery wears,
As in a garment often dyed appears. *Dryden.*

The Dorick dialect has a sweetness in its clownishness, like a fair shepherdess in her country russet. *Id.*

This white spot was immediately encompassed with a dark gray or russet, and that dark gray with the colors of the first iris. *Newton's Opticks.*

The russet pearmain is a very pleasant fruit, continuing long on the tree, and in the conservatory partakes both of the russeting and pearmain in colour and taste; the one side being generally russet, and the other streaked like a pearmain. *Sturtevant.*

R U S S I A.

RUSSIA (from Slav. *Rossi* or *Russi*, a small Slavonic tribe) comprehends a portion of Europe and Asia, exceeding in extent any empire that was ever before included under one form of government. It borders on the Baltic, the Euxine, and the Caspian, and is washed both by the Arctic and Great Pacific Oceans. Stretching from the eastern confines of Asia to the mountains of Olonetz, and from the mouths of the Don, the Volga, and the Kuban, to the Frozen Sea, Russia comprises, independently of islands and promontories, 165° of longitude and 32° of latitude; being 9684 miles in length and 2400 in breadth. It contains a surface of about 4,000,000 square miles, and a population of more than 42,000,000 inhabitants, or about ten persons to each square mile. The population of European Russia, exclusively of the kingdom of Poland, does not much exceed 40,000,000. The chief augmentations by which the empire has been enlarged (for since its provinces were united under one government they have never been contracted) are the following, as stated in the Russian Court Calendar for 1817 :—

The conquest of Siberia took place in 1573. Yermak, the hetman of the Don Cossacks, rebelled against the authority of Russia, and was obliged to flee before the forces of the czar. In this extremity he ascended the Ural mountains, and discovered the vast plains of Siberia. Animated by the idea of founding a new empire, in these unknown regions, he pushed on from conquest to conquest, till he had subdued all the savage tribes from the Ob and the Ural to the Altaian mountains. But, being unable to preserve the conquests which his valor had achieved, he laid the fruit of his victories at the feet of the czar, who not only forgave his rebellion, but rewarded his talents, his courage, and his enterprise. 'Thus an empire more extensive than Mexico or Peru was added to the Russian territory, by a man inferior to the conquerors of the New World, only because his exploits have not been recorded.' Little Russia was added to the former possessions in 1644; and Livonia, Esthonia, Ingria, Carelia, Viborg, and several islands in the gulf of Finland, were ceded to Sweden, at the peace concluded between the two powers in 1721. White Russia was annexed in 1772; and the Crimea, the island of Taman, and a great part of the Kuban, comprising a vast territory, with about 1,500,000 inhabitants, were wrested from the Porte, by the treaty which the menacing attitude of Catharine II., and her celebrated minister Potemkin, induced that power to sign in 1784. The dukedoms of Lithuania and Courland augmented the accumulating mass in 1793; and the partition of Poland, about two years afterwards, added nearly 3440 square leagues, and about 2,000,000 inhabitants. Georgia was annexed in 1801; and Bailystock in 1807. The war between Russia and Sweden, in 1809, proved disastrous to the latter, and Russia acquired Finland by the peace that was concluded in September of that year.

VOL. XIX.

By a treaty of peace in August 1811 between Russia and Turkey the former obtained the province of Bessarabia, and the eastern part of Moldavia; for by that treaty the Pruth, from its entrance into Moldavia, to its junction with the Danube, and this last river to the Black Sea, were fixed as the boundaries between the two empires. The grand duchy of Warsaw was also annexed to Russia in 1815, but now constitutes a great part of the present kingdom of Poland.

This empire has undergone much variation in its political divisions. In 1796 Catherine II. divided the whole into fifty governments; a division annulled by Paul in 1800, another, comprising forty-one governments, being substituted in its stead. When the late emperor ascended the throne, he re-established most of the governments which his father had abolished; and a Ukase for that purpose was published in September 1801, by which the forty-one existing governments were increased by five others that had previously been established, and four more were added, which made the number fifty. The acquisition of Finland has been made since that period. The following are its present chief divisions :—

GOVERNMENTS ON THE NORTH.

Governments.	Capitals.
Finland	Abo
Wyburg	Wyburg
Olonetz	Olonetz
Archangel	Archangel
Esthonia	Revel
St. Petersburg	St. Petersburg.
Novogorod	Novogorod-Veliki
Vologda	Vologda
Livonia	Riga
Pskove	Pskove
Twer	Twer
Jarosla	Jarosla
Kostroma	Kostroma.

GOVERNMENTS IN THE CENTRE.

Smolensko	Smolensko
Moscow	Moscow
Volodimir	Volodimir
Nizney Novogorod	Nizney Novogorod
Kaluga	Kaluga
Tula	Tula
Riazan	Riazan
Tambof	Tambof
Orel	Orel
Kursk	Kursk
Woronetz	Woronetz
Tschenigo	Tschenigo
Ukraine	Karkof.

GOVERNMENTS ON THE SOUTH.

Kiev	Kiev
Catharinoslaf	Catharinoslaf
Cossacks	Tscherkaskoy
Taurina	Caffa
Caucasus (part in Asia).	

N

GOVERNMENTS ON THE EAST.

Governments.	Capitals.
Perm (part in Asia)	Perm
Vyatka	Vyatka
Orenburg (part in Asia)	Orenburg
Kazan	Kazan
Simbirsk	Simbirsk
Penza	Penza
Saratof	Saratof.

GOVERNMENTS ON THE WEST.

Witepsk	Witepsk
Moghilef	Moghilef
Courland	Mittau
Wilna	Wilna
Grodno	Grodno
Minsk	Minsk
Volhynia	Lucko
Podolia	Kaminieck
Cherson	Cherson.

I. EUROPEAN RUSSIA.—European Russia occupies the north-east portion of Europe; being bounded on the north by the Frozen Ocean; on the east by Asia; on the west by Sweden, the gulf of Bothnia, the Baltic, Prussia, Poland, and Austria; and on the south by Turkey and the Black Sea. It extends from about 44° to 72° of N lat.; and from 22° to 60° of E. long. from Greenwich. Its length in a right line on the western frontier is about 1940 miles; but from south-west to north-east it is nearly 2180 miles. Its greatest breadth is about 51° of lat., where it is nearly 1520 miles. Its superficial extent has been estimated at about 1,000,000 square miles.

The two distinguishing features of this part of Russia are vast plains, denominated steppes, and majestic rivers. Some of the former consist of an extremely fertile soil; others are saline wastes; while a middle kind produces a scanty supply of vegetation, and are occupied, in summer, by tribes that roam in quest of pasturage. The most noted of these steppes are, 1. The desert of Petchora, situated between the Dwina and Petchora, and extending from 63° of lat. to the shores of the White Sea. This plain is interspersed with forests and small lakes, and is almost destitute of inhabitants, except in the vicinity of Archangel and Mezen. 2. The steppe of the Dnieper, including the Crimean desert, and comprised between the Dnieper, the Don, and the sea of Azof. It consists chiefly of dry sand diversified with salt lakes. The appearance indicates its having once been a submarine bed, the waters of which, by bursting the Thracian Bosphorus, may have flowed into the Mediterranean. 3. The steppe of the Don and the Volga, which occupies a considerable part of the space between these rivers. The great and generally rich plain bounded by the Volga and the Ural is about 2° further north than the latter, and stretches towards the Caspian.

Other parts of the Russian territory, though generally flat, present more variety. The surface, generally speaking, is composed of two inclined planes; one sloping towards the south and south-east, and the other descending towards the opposite points. These declivities meet on

the east side of the empire, about 60° of lat. and thence follow a winding line towards the south-west, till their union reaches 50°, and quits Russia in the vicinity of Smolensko. From this waving ridge, the waters flow on the one side to the Euxine and Caspian; and, on the other, into the White Sea and the Baltic.

The mountains of Olonetz originate in the northern extremity of Lapland, and stretch through about 15° towards the south. The northern parts are constantly covered with snow; the more southern regions with forests, and contain various metals, particularly iron. The mountains of Valday, which are crossed by the road from St. Petersburg to Moscow, have been supposed, by some travellers, to be merely a continuation of the former chain. They are chiefly composed of clay and sand, with occasional blocks of granite, forests, and fertile valleys. This elevated region gives rise to the Volga, the Duna, the Dnieper, and the Ocka. A ridge of hills likewise extends through Moldavia and Bessarabia, along the southern coast of Taurida, and connects the Carpathian with the Caucasian chain. 'They form the southern extremity of the peninsula, and consist of calcareous matter, supported, as it were, by pillars of marble, trap, clay, common lime-stone, and schistus, in parallel and almost vertical veins, alternating with each other. This singular ridge has the appearance of an amphitheatre along the Euxine. The vales produce the laurel, the olive, the fig, the lotus, and the pomegranate; the cliffs are adorned with the red bark and perpetual foliage of the strawberry-tree; while the sheep and goats, clinging to the declivities, combine with the simple manners of the Tartars to form an enchanting picture.' The Uralian mountains, which separate Europe from Asia, for more than 1200 miles, have already been mentioned in our article EUROPE. This range declines abruptly on the western side. The highest part is in the province of Orenburg, and the most elevated near the western verge of the range. These, however, do not exceed 4500 feet in height.

The principal rivers descending towards the south are the Volga, the Don, and the Dnieper. Those that run in an opposite direction, the Petchora, the Dwina, the Neva, and the Duna, with their tributaries.

The level nature of the soil, and the number of large rivers, are extremely favorable to internal navigation of all kinds. Peter the Great completed the navigation from the Caspian to the Baltic, by opening the canal of Vishnei Voloshok, between the river Twerza, that falls into the Volga, and the Shlina, which terminates in the gulf of Finland. Various other plans of internal navigation have at different times been wholly or partially executed; and the repose of peace, aided by the information which the Russians have derived from their visits to the more improved nations of Europe, will doubtless be employed in promoting the national resources of these vast dominions. Among these improvements, the construction of canals is finding a place, though they are rendered less necessary in Russia than in most other countries, by the

continued intensity of the frost, which makes the conveyance of heavy articles on sledges a matter of ease constantly to be depended on. No sooner has the frost set in than sledge-ways, covered with these vehicles, are opened from the gulf of Archangel to the mouth of the Don, and from the banks of the Irtysh to those of the Neva. Some of the Russian lakes are the largest bodies of fresh water in Europe: as those of Ladoga, Peypus, Onega, and Ilmen. Russia also contains several others.

Russia is generally connected with the idea of *cold*; but this applies only to the northern districts; those of the opposite extreme participate

in the temperature, and yield all the products of southern Europe. With respect to climate, European Russia may be divided into three distinct regions; the cold one from 60° northward; the temperate between 50° and 60°; and the warm from 50° to the southern extremity. In the first of these the severity of winter is great, and confines the labors of agriculture to a very limited period. Little vegetation appears before June; but then the accumulated heat of almost continual day renders its progress vigorous and rapid. The extremes of heat and cold at St. Petersburg during ten years were as follow:—

GREATEST HEAT.			GREATEST COLD.	
Year.	Day.	Degree of Fahrenheit.	Day.	Degree of Fahrenheit.
1782	12th July	85°	16th February	29° below 0.
1783	17th June	88	9th January	23 ditto
1784	29th July	92	30th January	8 ditto
1785	23d July	86	3d March	22 ditto
1786	27th June	87	2d January	24 ditto
1787	13th June	92	9th February	14 ditto
1788	18th July	95	{ 20th January }	15 ditto
			{ 23d December }	
1789	19th July	90	12th January	20 ditto
1790	31st July	78	3d and 10th February	8 ditto
1791	15th June	86	7th and 22d December	10 ditto

The climate here is as changeable as in our own country. Fahrenheit's thermometer has been known at St. Petersburg to be at 3° one day, and nearly 37° the next; making a difference of about 34° in a few hours. Storms of thunder and lightning seldom take place in Russia; but the aurora borealis is very frequent, and the atmosphere is often seen to discharge electric fluid. Near Moscow the rivers are generally frozen as early as the beginning of November; and the ice seldom breaks up till the middle of March. The buds of the birch expand in May, and its leaves fall in September. In the southern parts of this middle region, particularly in the government of Tula, Orel, Kursh, and Kiev, the climate resembles that of parts of France. It produces apples, pears, plums, melons, and arbutuses. But here, as well as in the former region, the year embraces only two seasons. Snow clogs the path of retreating summer, and a vivid sun at once dissolves the winter's frost. In the southern regions the luxuriance of warm latitudes greets the travellers' eye, and wine and silk, with abundance of choice fruits, are found. Spring begins with March, and continues to the end of May. Nature is then arrayed in her most brilliant colors, and every aspect under which she is viewed is refreshing and beautiful. In June, the influence of the sun becomes powerful, the plains lose their verdure, the springs are dried up, and the rivers cease to flow. Fahrenheit's thermometer, in the shade, often exceeds 100°. September is sometimes far advanced before the fiery glare of summer abates. In this season rain and dew seldom fall; but in the peninsular province of Tamida the heat, during the middle

of the day, is tempered by refreshing breezes from the sea, succeeded in the evening by others from the land. Here the climate is salubrious; though in some other districts of the south the swamps and saline steppes are unhealthy. As autumn advances the nights become cold, and this season is the most sickly in the year. In winter the tops of the mountains are covered with snow.

The varieties of the soil we have already glanced at. Barren deserts occur even in the southern regions, and wide-spread plains, impregnated with salt. The governments of Volodimir and Riazan are esteemed the most productive. There the soil consists of a rich vegetable mould, and yields all kinds of grain and esculent vegetables. On some of the steppes the grass grows to the height of a man.

The Russian *forests* are perhaps unequalled in the old world, and consist of oak, pines, cedars, firs, linden, and birch. The shores of the Volga, the Ocka, and the Don, are adorned with vast woods of oak, whence it is conveyed to the ports of the Baltic and the Euxine. The Valchonskoi forest, through which the road lies from Viesma to Moscow, extends on all sides to a great distance. The governments of Olonetz, Archangel, Perm, and other northern regions, are likewise covered with forests of unknown extent. Even the road from Petersburg to Moscow runs chiefly through a succession of woods. The fir, the pine, and the black pine, are the prevailing trees in the northern parts. On the Ural mountains the cedar grows in abundance, and is often cut down by the inhabitants for its cones, which yield excellent oil. The larch flourishes in the

north, and is employed in ship-building, and for its turpentine and charcoal. In addition the beech, the elm, the maple, and the poplar, grow in the southern regions. The birch is used in various ways. Its bark is employed in tanning; its leaves afford a yellow dye, its sap a liquor called birch wine, and its wood not only supplies fuel, but is converted into domestic vessels. The linden is likewise equally valuable. Its outer bark is manufactured into carriages, baskets, trunks, and covering for cottages; and the inner rind into mats. The rind of its shoots is platted into shoes for the boors. Its blossom supplies food for bees, and its wood is made into boats.

The Russian agriculture is generally in a very rude state. In the north both the soil and climate are unfavorable to its progress, and a few patches of feeble rye are almost the sole evidences of civilisation; and the thinly scattered inhabitants chiefly derive their subsistence from the fishery and chase. In Finland also the inhabitants grow little grain. See FINLAND.

The productions of this extensive empire, it has been long said, are as various as the soil and climate. Here the gifts of Providence are scattered with a profusion which, while it corresponds with the prodigality of the inhabitants, forms a singular contrast with their indolence, poverty, and unskilfulness in the arts of wealth and comfort. The Russians at once suffer from want, and allow abundance to corrupt; and though they might supply the world they depend on others. The following facts have been recently stated:—‘The harrow consists of short wooden pegs, driven into thin laths, woven together with willows. The use of the roller is hardly known. A crooked stick frequently serves as a flail. To drain moist lands or swamps is not at all the practice, though they are so numerous and prejudicial to man and beast, and might be converted into the finest corn fields. The steppe lands are employed a short time without manure and then forsaken. When a boor has fixed on a piece of forest land for the purpose of making it arable, together with the bushes and young wood, he cuts down and consigns to the flames, trees which have stood for two centuries, and are fit to be the ‘mast of some great admiral.’ If he cannot fell such large trees, stripping them of their bark, he leaves them to wither, and kindles the brush-wood under them. In burning the dry weeds and grass for the purpose of manure the forests are sometimes set on fire, and consumed for miles. The boor has no conception of artificial manure, marl, chalk, or pond-mud. The land is seldom clean harrowed.’ Oats, rye, wheat, and barley, are sown in most parts; and raised in considerable quantities. Rice is grown in some of the southern districts; but hemp and flax are the principal objects of culture. In some of the Uralian mountains they grow wild. Hops and tobacco are cultivated in the southern provinces. Beyond 60° of latitude the vegetables resemble those of the northern parts of Norway and Sweden. Between 50° and 60° they differ little from those of Great Britain and Ireland. Almost all sorts of culinary vegetables are cultivated. This region is also plentifully stocked

with fruit trees and shrubs; and vast orchards of apple, pear, plum, and cherry trees appear. Cherries are produced in such abundance that both wine and vinegar are made of them. Nuts and walnuts are likewise plentiful. Various berries are annually gathered in vast quantities, and eaten either raw or preserved. They include gooseberries, currants, strawberries, cranberries, &c. &c.

Maize, rice, and cotton, are among the common products of the south. The fruits comprise chestnuts, almonds, pomegranates, olives, figs, peaches, apricots and mulberries, with grapes and other delicate fruits of southern climates. The vine is cultivated by the Cossacks of the Don, but in an imperfect manner. The water-melon often weighs 30 lbs., and is of an excellent flavor.

Cattle abound in all parts of Russia, and form a principal source of wealth. The breed is often large, and as well as that of the sheep has been much improved; but they are frequently left to seek their own food in the fields and forests. Buffaloes are numerous in the south. The long-tailed sheep, kept by the Cossacks of the Don, and other tribes in the south, yield wool of an excellent quality. The large sheep which range over the steppes of Taurida are covered with coarse wool mixed with hair; but the skins of their lambs furnish a fine colored and valuable fur in great request. The silky-fleeced Tauridan is also a valuable but small breed. Sheep indeed are so numerous in the southern provinces that a common Tartar often possesses a flock of 1000, and a rich one of 50,000. There are also great numbers of swine in Russia.

Notwithstanding the diversity of climate and treatment, the native Russian horses have a considerable resemblance to each other. All are of a compact form, with ram-like heads, and long and meagre necks, but they are hardy and active. In the governments of Moscow, Tambof, Kazan, and some others, the native breed has been improved by the introduction of foreign horses. The Tartar horses are of known excellence. Those of the Cossacks are small but indefatigable. The Russian cavalry is chiefly composed of Lithuanian horses. The Russian nobility pay great attention to the breed of this animal. The ass is little used; but, as well as the camel and dromedary, it is sometimes employed in the southern provinces for domestic purposes. The rein-deer is the principal domestic animal in the north. Goats are common in all the districts; and are kept both for their milk and hair. The peculiar species bred in Taurida sheds its fleece every spring; it is obtained by combing the animal at that season. In both silkiness and elasticity it exceeds the finest wool.

Among the wild animals are the bear, the wolf, the lynx, the fox, the deer, the elk, the antelope, and many other smaller species. Those which are most valued for their furs are inhabitants of Siberia; but hares and rabbits are common to all parts. The wild boar is found on the steppes of the Volga, and the borders of the Uralian forests; and is often hunted by the Cossacks. So much does this animal fatten on the roots and salt plants of the steppes, that he

often weighs more than six hundred weight. The flesh is esteemed a delicacy, and the animal is rarely killed without danger. The antelope ranges in large herds in the south.

Russia possesses nearly all the species of birds which are to be found in Europe. The number of wild fowl that flock to the desolate steppes, marshes, and forests, is almost incredible. Some idea, however, may be formed of their number by their value when caught; a bustard, weighing 20 lbs., is frequently sold for thirty or forty copecs, which is only equal to a few pence. Other game are equally plentiful.

The sturgeon is caught in the Volga, and some of the other rivers, in the highest perfection. The sterlet is also an excellent fish, common in the lakes and rivers; and a rich salmon is peculiar to the Kama, a stream that falls into the Volga. It is from three to four feet in length. To the general diffusion of the common species of European fish through the rivers of Russia, the eel forms an exception, none being found either in the Volga or in the rivers to the east of it. It is also remarkable that the herring and seal are here found in some of the lakes and even the rivers.

ASIATIC RUSSIA.—Asiatic Russia extends from about 37° of E. long., to the eastern extremity of Asia, (more than 5000 English miles), and from the Frozen Ocean to the great range of mountains which separates it from the central plateau. Its breadth exceeds 1500 miles; but it is much narrower towards the east. The whole surface is computed at 3,000,000 of square miles, with about one individual to each. The population is composed of a variety of primitive tribes, intermixed with a few Russian settlers, and a small accession in the east, which from its difference in manners, customs, and appearance, is supposed to be of American descent. The ancient Greeks and Romans extended their Scythian Ocean over the wide regions of Siberia; but Ptolemy, who was better informed, placed an unknown land in that direction: and Marco Polo, with other travellers of the middle ages, obtained some vague ideas of a country in this part of Asia, rich in furs. In the middle of the thirteenth century the Monguls had established a government on the Irtysh, in the western part of Siberia, but Russia was then too frequently exposed to the ravages of its eastern neighbours to carry either its arms or its investigations into those regions. Even when her internal divisions had enabled her, in some measure, to consolidate her empire, its southern and eastern frontiers were exposed to hostile attacks, and the northern provinces of Archangel afforded the means of first becoming acquainted with the countries bordering on that quarter. The Samojedes of the Oby and the adjacent districts visited Russia to barter their furs with the natives. This excited their curiosity, and enterprises were undertaken to the countries whence the furs were brought.

Yermack, one of the principal chiefs of the Cossacks, with about 6000 followers, first entered Siberia in quest of new regions, and vanquished Kutchum, the khan of Siber, took his capital, and suddenly found himself at the head of an almost unlimited empire. Apprehensive, how-

ever, that continual efforts would be made to wrest the newly-acquired sceptre from his hands, he endeavoured to secure it by laying it at the feet of the czar. This was an offer too congenial with the Russian disposition to be refused; and, though the conquest was transient, it not only disclosed those eastern countries, but animated the hope of permanent success. The Russians soon after penetrated to the Yenisei, or Jenisei, and, having conquered the Tonguses, enjoined them to prosecute their discoveries to the east. These people fulfilled their commission, and soon penetrated to the Pisida, which is supposed to have been the Angara, on the opposite side of which they found a people, whom they described as 'of good understanding, well set, with small eyes, flat faced, brown color, and inclining to tawney.' But they could not understand their language. The Russians now soon arrived at the Lena, descending its stream to the Frozen Ocean; in 1639 one of their adventurers reached the eastern shore. Thus, in half a century, a few wandering Cossacks and Tungusian hunters, added an extent of country to the Russian empire that stretched one-third round the globe. After this they founded the towns of Irkutsk and Nertschinsk, and established a line of posts along the Amur. The map of the Caspian, constructed by Peter the Great, was an important accession to the progressive geography of that district, and was the first document which represented that sea as stretching from north to south, instead of from east to west, as had been previously supposed.

The mountainous region, at the south-west extremity of Asiatic Russia, has always been inhabited by rude tribes, under independent chiefs, secure in their own fastnesses. Here they have imbibed, and constantly cherished, the spirit of the feudal ages; and, though Russia has made great advances in the work of subjugation, she is yet unable to exact more than a precarious submission, and can only levy her imposts by force of arms, and a chain of military posts.

Asiatic Russia consists of two distinct parts, Siberia and Caucasus. The first is divided into the two great governments of Tobolsk on the west and Irkutsk on the east. The latter government includes the peninsula of Kamschatka. Besides these two governments, the province of Astracan, with parts of Caucasus, Perm, and Orenburg, are Asiatic. We therefore adopt the following general division:—

Governments.	Capitals.
SIBERIA	{ Tobolsk . . Tobolsk
	{ Irkutsk . . Irkutsk
	Astracan . . Astracan
	Part of Perm
	Part of Orenburg
	Part of Caucasus Georgiewsk
CAUCASUS	{ Cossacks of the
	Black Sea . . Ekaterinodar
	Circassia . .
	Georgia . . Tiflis
	Lesghistan .
	Daghestan . . Derberd
	Schirwan . . Baku
	Mingrelia . . Zalikara
	Imeretta . . Catalis.

Abassia, bordering on the north-eastern shores of the Black Sea, is under the protection of the Turks; and Circassia, with some divisions of the other provinces, nearly independent. Georgia, however, was incorporated with Russia in 1800. The extent and population of those various governments are uncertain.

The ice-bound shores of the Arctic Ocean stretch along the north; while the fury of the eastern wave, and the action of subterranean fire, seem to have rent the oriental regions into vast promontories and islands. An immense range of mountains sweeps along its southern confines, mingling with the Caspian and Caucasian chain. The Uralian mountains, which constitute the western boundary, we have already noticed.

In Asiatic Russia the general surface, like that of the European portion of this empire, is chiefly composed of steppes; sometimes arid or saline deserts, at others principally occupied by marshes, or covered with almost interminable forests; while some consist of a fertile soil, and produce a luxuriant vegetation. Asiatic Russia, however, is not destitute, on its confines, of mountain ranges. The great ridge which stretches nearly from the eastern shores of the Caspian to the promontory of Tschutsloi is known by various names. The Altaian mountains form a barrier between this empire and independent Tartary. South of the lake of Baikal the mountains of that name, supposed to be the highest points of the chain, rear their summits to more than 10,000 feet above the sea. In most parts of the chain, however, they are lower. After bending to the north, they are known as the Daouria, which are succeeded by those of the Yablounoi and Stannovoi, which give place to the vague denomination of the mountains of Okotsk. The component parts of this range are various. In some, great masses of granite indicate a primitive formation, while in others, limestone, marble, petrified shells, and valuable ores abound. This range gives rise to many of the largest rivers of Northern Asia; but little is known beyond its outlines and general direction. Several lower ridges diverge from it, and diversify the neighbouring districts.

Through Kamtschatka also a mountainous range stretches, the highest summits of which are covered with perpetual snow, and many of them constantly shaken by volcanic fury. One of these is situated near Nijni Kamtschatka, and may be seen at the distance of more than 100 miles. Scarcely two years elapse without eruptions, when the whole country is covered with ashes for thirty miles round. Another active volcano rises near the southern extremity of Kamtschatka.

The Oby, the Yenisei, and the Lena, are the largest streams, and divide all the broad part of Siberia into three great basins. A few smaller streams also enter the Arctic Ocean from the narrower districts on the east. The first of these vast basins embraces all the space between the Uralian mountains and 90° of long., being about 30° from east to west, and 20° from north to south. Many writers place the source of the Oby in the lake of Altun, or Altyn, about

52° of lat.; but, as the Shabetian is the only confluent river of that lake, it may, with propriety, be considered as the parent stream, which extends several degrees to the south, and nearly to 95° of long. After crossing the Altaian chain it flows in a serpentine direction towards the north-west, till it meets the Irtysh, which issues from the said mountain range, and rivals it in magnitude.—Subsequently to its junction, it winds to the north, and forms that vast estuary called the Sea of Oby. Having collected the waters of such a wide space it becomes a large river long before it reaches the sea, and is in some places several miles in width. Its whole length is about 2180 miles, the greater part of which is navigable.—The Irtysh flows nearly in the same direction as the Oby, but a few degrees more to the west.

Several important streams likewise fall into the Caspian and Black Seas. The Ural rises from the south-western part of the Uralian chain, and, after flowing towards the west, turns to the south, and enters the Caspian. In the upper part of its course, its banks are steep and rocky, but it afterwards flows through a vast saline steppe: its fisheries are an inexhaustible source of wealth to the Cossacks. The Volga also falls into the same sea, which is likewise joined by the Terek and the Kuma on the west, while the Kuban or ancient Hypanis flows in the opposite direction, and enters the Euxine near the Isle of Taman.

Siberia contains few lakes; but the vast Baikal has often been delineated as an inland sea. Another large lake is met with about 52° of lat. and east of the Irtysh. Its length is 170 miles, and its shape very irregular. An island divides it into two parts, called the lakes of Tchany and Soumi. Several other lakes are situated between this and the Uralian mountains. That of Altyn has been mentioned in the description of the Oby. It is on the north side of the Altaian chain, and is nearly forty miles long and twenty broad. The largest lake in the north of Siberia is the Piazinskoi, in 68° of lat., and a few degrees east of the Yenisei. Some small saline lakes are found on the steppes north of the Caspian, and are considered as indications of that sea having extended much farther north than at present.

With respect to the climate, Asiatic Russia is colder than the European part, under the same latitudes. Beyond 60° the winter lasts nine or ten months, and the earth is frozen to a great depth; but the almost perpetual day imparts considerable heat to the summer. In the vast marshes traversed by the lower part of the Oby the whole accumulated heat of this period, however, does not thaw the ground more than two feet; and Gmelin states, that, at Jakoutsch, in 62°, the ground in the middle of summer was found to be frozen at the depth of three or four feet. The use of wells is therefore entirely prevented.

In the southern parts the cold is often extreme. Pallas witnessed the freezing of mercury in 58° of lat.; and even on the southern borders in 50° the cold is severe. North of the lake of Baikal, the summer is generally so short and uncertain

that agriculture is almost impracticable. In the most genial parts, where it is attempted, if the crop does not ripen before the end of August, it is usually buried in snow, before the husbandman can reap the reward of his labor. Captain Cook found snow six feet deep on the eastern coast in May, which was not dissolved till June. There the thermometer stood at 32° during the whole of the former month, and even in the middle of the latter it did not rise higher than 58°. In August it reached 65°, and the lowest point to which it sunk was 40°. In October the ground was again covered with snow. Winter then begins his sway, and, though in the latitude of England and some of the finest provinces of France, the mercury commonly stands below 20°.

With the name of Kamtschatka is connected the idea of one of the most desolate and inhospitable regions on the globe. Its geographical situation, however, renders its climate and productions much superior to those of Siberia. Baron Steinheil, who lived several years in this distant land, and drew up a plan for the improvement of the country, asserts, 'From a long course of observations made during my residence in Kamtschatka, I am convinced that both the climate and soil are such as that agriculture might be carried on with the most complete success.' But see our article KAMTSCHATKA.

The forests of Siberia contribute to render the air in many places damp and unwholesome, particularly in the western regions. The eastern districts are colder, but more salubrious. In most parts the winds are violent, and tremendous hurricanes often bury both man and beast beneath the sand and snow. Near the Caspian the inhabitants enjoy a warm and protracted summer, though the winter is cold. In the province of Astracan, the heat is sufficient to mature the grape, and much excellent wine is made. Mulberry-trees flourish also, and silk is produced in considerable quantities. In the mountainous region of Caucasus, the climate exhibits every variety. On the southern side heat prevails in the valleys, and cold on the mountains; the following extract from Mr. Glen's Journal gives a good idea of the climate of the northern side. 'The temperature of the atmosphere is in general,' he says, 'much more equable than at Astracan; the thermometer does not rise so high in summer, neither does it sink so low in winter; and, what may appear strange, the temperature is still more equable in the valleys of the snow mountains. Last winter (1818-19), when the thermometer fell to 17° in the colony, the rivulets among the mountains were not frozen, and the valleys were green all the winter through. The summer heats, too, are less oppressive. In short, from all accounts, the climate in these valleys does not materially differ from that of the valleys among the hills of our native country (Scotland). The most striking characteristic of a Karass winter, as it set in about the beginning of December, 1819, was a strong rind (rime), that lodged on the branches of trees, in the form of minute icicles, in such quantities as to weigh them to the ground, or break them. Its appearance is picturesque and romantic in a high degree; but its effect particularly in the orchards, destructive.

Nor are large trees proof against its overwhelming power. I have seen the massy branches of some of them break down with a crash, in a dead calm, merely by the weight of the rind. When it is strong, the whole country is overhung, sometimes for many successive days, by a thick fog.'

The oak and the hazel, which bear the rigors of a German winter, will not flourish under the same parallels in Siberia. They indeed stretch along the northern base of the Altaian chain, but farther north they become stunted. The common heath that covers many of the lower districts of Lapland is not to be found in these wastes. It must not, however, be inferred that these plains are merely tracts of snow; on the contrary, almost interminable forests of birch, elder, lime, maple, poplar, and aspen, interspersed with millions of pines, cover many parts. The Siberian plum, the crab, the mountain ash, the willow, and other trees, are found; and the short summer exhibits a brilliant display of flowers. The lily of the valley, and several bulbous-rooted plants, are concealed beneath the snow for the greater part of the year.

Though *agriculture* is but little practised in Siberia, the crops are occasionally good; nearly two-thirds of the country, however, yield no grain. Hemp and flax are cultivated in some parts, and the potatoe has likewise been introduced. The cattle, in a few of the richest steppes, are of a tolerable size, and the Mongol horses are beautiful; some of them resembling the tiger, and the leopard, in the variety of their colors. In all the northern and eastern regions, except Kamtschatka, and a few other parts, where dogs are employed in drawing sledges, the rein-deer is, however, the most valuable possession of the natives. The utility of this singular animal is greatly enhanced by its capability of enduring the most extreme cold, and subsisting on a species of moss. A Samoiede often possesses 150 or 200; and the wealthy Koriaks and Tchouktchis several thousands each. The Siberian dog resembles the wolf, and in many parts supplies the place of the rein-deer, in drawing the sledge. The wild animals are numerous.

The *mineral* productions of Russia are chiefly obtained in the Asiatic regions.

The primitive mountains supply granite and porphyry in great abundance. Alabaster is also found in extraordinary quantities and of every color. Yellow, gray, and cloudy marble abounds in many places, and white is found in the Uralian quarries, little inferior to the finest Parian. A great variety of gems have also been discovered in the mountainous part of the empire.

Various parts of Russia yield gold, silver, copper, iron, and lead. The chief gold-mines are on the Asiatic side of the Uralian mountains, and were first opened in 1754. These annually supply about 6430 tons of ore, which yield about 190lbs. of refined metal. But the produce has now been increased, as is stated, to nearly 280lbs. of gold. The mines which were previously opened, in the mountains of Olonetz, have either been abandoned or are now little productive.

Mines of silver are worked in several places,

but chiefly in Asia; and the whole produce is stated at 46,800lbs. of the refined metal. Lead mines have been worked in Russia for more than a century, and still yield a considerable quantity of metal. The number of workmen employed in all these mines is estimated at 70,000; and the value of the produce exceeds double the expenses of working them. Copper is obtained in the mountains of Olonetz, in the Uralian chain, and in Asia. The quantity of copper now annually obtained has lately been stated at 67,000 quintals, each equal to about 108lbs. avoirdupois, which is consequently equal to 3230 tons; and its value exceeds £250,000.

Most of the mountains, and many of the plains, of Russia afford iron-ore, and great quantities are annually procured, in the manufacturing of which about 100 forges and 800 hammers are constantly employed. The value of the iron is more than double that of the copper. The whole produce of all the gold and silver mines belongs to the crown, with a sixth of the copper and one-eighth of the iron.

Coal has been found in various parts of Russia, and attempts are making, under the immediate sanction of the emperor, for discovering it in others.

Salt abounds, and is found in the pure and solid rock, at the bottom of the lakes, in the liquid spring, and incrusting the plains. Rock salt is obtained in the government of Orenburg, and in the steppe of the Volga; the salt lakes of Saratof, Taurida, and other places, yield large quantities, as well as the impregnated springs of Perm and Novogorod. Glauber's salts, and several of the other saline species, are likewise found. Thermal springs are found in various places, and of different temperatures, from merely warm to 190° of Fahrenheit's thermometer. The most celebrated vitriolic waters are at Sarepta, near the banks of the Volga, in the government of Saratof, and are much frequented. The water is clear and saline, its taste not unpleasant, and its temperature generally about 10° of Fahrenheit above the common water in its vicinity. These waters are beneficial in various complaints, such as inflammations, cramps, and inveterate colds. They are supposed to contain about 1-200th part of earthy and mineral ingredients. The spring is very copious. The principal places in European Russia where naphtha is found are in the district of Perekop, in the government of Taurida, and in the Island of Taman; but it is still more abundant in the Asiatic part of the empire. Incrusting springs are numerous, and the mountains contain stalactic caverns, with springs that incrust substances with a coating of iron ore.

The chief towns of the provinces will be found in their places in our alphabet, and St. PETERSBURG and Moscow have received our particular attention, see these articles. Kiev, the original cradle of the monarchy, was settled by a colony of Sarmates before the Christian era. Its appearance from the Moscow road is thus described by Mr. James:—'Arrived at the top of a declivity,' says our traveller, 'a new scene presented itself. The cupolas, that before were but as spots in the view, faced us with a blaze of gold, and a thousand gay colors which dazzled the eye.

The country below showed an unvaried plain of immeasurable extent, covered with a thick forest, through the middle of which the Dnieper, now dwindled to a streamlet, was seen winding its silvery path into the horizon. It was a land seeming untouched by man, and afforded a prospect as wild in appearance as any that the most uncivilised tracts of America could furnish.' Kiev is celebrated for its ancient catacombs, which render it the resort of numerous pilgrims, many of whom undertake a journey of 1500 versts on foot.

Tcherchaskoy, the capital of the Don Cossacks, is situated on the river Don, about 100 miles before it is lost in the sea of Azof. It is thus described by Dr. Clarke:—'The appearance of Tcherchaskoy, as the traveller approaches it upon the river, affords a most novel spectacle. Although not so grand as Venice, it somewhat resembles that city. The entrance is by broad canals intersecting it in all parts. On each side wooden houses, built on piles, appear to float on the water; to these the inhabitants pass in boats, or on narrow bridges, only two planks wide, with posts and rails, forming a causeway to every quarter of the place. As we sailed into the town, we beheld the younger part of the inhabitants upon the house-tops, sitting upon the ridges of the sloping roofs, while their dogs were actually running about and barking in that extraordinary situation. During our approach, children leaped from the windows and doors like so many frogs, into the water, and in an instant were seen swimming about our boat. Every thing seemed to announce an amphibious race: not a square inch of dry land was to be seen; in the midst of a very populous metropolis, at least one half of its citizens were in the water, and the other in the air.' The population is estimated at 15,000 individuals. Nicholaef is the chief town in the southern part of the empire.

The principal town in the eastern part of Siberia is Irkutsk, on the right bank of the river Angara, at a short distance from the sea of Baikal. The streets are in general broad and regular, but not paved. Most of the private dwellings are of wood; the government buildings and churches of stone. This is now considered as the capital of the whole of Siberia. The mode of living is quite oriental; and the wives and daughters of the principal citizens are seldom seen except on public occasions. Nearly in the same latitude, on the Chinese borders, and about ten or twelve degrees further east, stands Nertschink, in the midst of a mining district. The caravans engaged in the China trade formerly passed through Nertschink, but since they have followed a different route it has declined. Kiakhta, in the government of Irkutsk, and on the borders of China, has lately risen to eminence, as the centre of the trade between the two empires.

The privilege of engaging in arts and *manufactures* in Russia was, till lately, reserved for the nobility and the first and second class of artizans. But the emperor Alexander, by an imperial Ukase, dated December 1818, removed this obstacle to improvement. Among the articles most extensively made are linen, leather, isin-

glass, and kaviar, of which large quantities are exported. The two latter are prosecuted with great success on the banks of the Volga, and other great rivers in the south. Silk, cotton, woollen-cloth, sail-cloth, hats, lace, glass, porcelain, oil, soap, candles, cordage, and paper, are likewise manufactures found in various parts of the empire. Those of pitch, tar, pot-ash, alum, saltpetre, and gunpowder, with iron, brass, and copper works, are numerous: nor is any one more extensive or more productive to the revenue than that of spirituous liquors. Cannon, and all other implements of war, are made in great numbers; and several steam engines have been purchased in England, for the improvement of the different national establishments. Breweries and sugar-refineries have likewise been introduced.

The *fisheries* of the Volga, the Ural, and other rivers, form an important part of the Russian industry. Those of the last named river belong entirely to the Cossacks, to whom it has proved an inexhaustible source of wealth. The manner in which they are conducted is thus described in the European commerce of Rordansz:—‘The river Ural flows into the Caspian; when winter approaches, the fish seek refuge in the river from the storms which at that season visit the Caspian. They ascend the river in such immense numbers that it is hardly possible to form an idea of it, and stop at different places where they find sufficient water and food. The Cossacks carefully observe, beforehand, all the places where such a mass is collected, and wait there patiently till the river is frozen over. On the 1st of January the fishery begins upon the whole river, from the capital town Uralski, down into the Caspian Sea. Above and below the several banks of fish, the hetman first causes the river to be blockaded by means of large double nets extended across its whole breadth, which is effected by cutting in the ice a ditch, if it may be so called, two feet broad. As soon as it is certain that the fish cannot escape, the governor of Orenburg and the hetman of the Cossacks repair to a certain place on the bank of the river, and on both sides of it above 30,000 Cossacks are ready, each in his own sledge, drawn by a strong and swift-footed horse, and armed with a harpoon and an axe. By the order of the governor, a cannon is fired as a signal for beginning; hereupon the Cossacks all rush upon the river, and drive full speed to the fish-bank, enclosed with nets, which is usually some versts distant. Those who arrive first are praised not only for the swiftness of their horses, but for their courage, for this racing is attended with no little danger; because, if any one should be so unskilful, or so unlucky, as to overturn his sledge, all those that follow would infallibly drive over him. As soon as the Cossacks reach the place where there is such a bank of fish, they immediately cut a hole in the ice with their axe, and thrust in their harpoon, and the quantity of fish is so great that they never fail to strike one at every time. The terrible noise caused by the driving of 30,000 sledges over the frozen river naturally terrifies the fish, which try all to escape at once, but are hindered by the nets. The greatest difficulty for the fishermen

is to draw out the fish, and they are often obliged to call their comrades to assist; for they sometimes spear fish weighing 150 lbs. to 200 lbs.; but in such cases they must divide the fish with him who assists them. This fishery continues the whole winter, during which the Cossacks dwell in tents on both sides of the river. They proceed successively from one bank of fish to another, down to the mouth of the river. During this time, the river affords a very peculiar spectacle; both its surface and its two banks are covered with a countless multitude of men, who are in constant motion. Traders come from the remotest parts of the empire to buy the fish immediately from the Cossacks, with a great train of sledges, all loaded with salt; they constantly attend the fishery in its progress down the river to the sea. Every evening the Cossacks sell to them what they have caught during the day, and receive payment on the spot. The merchants send the fish (which are frozen quite hard) to Moscow, Casan, &c., and also an incredible quantity of the salted row of sturgeon, known under the name of kaviar. It is astonishing what a great number of different kinds of fish are found in the Ural, and they all attain an extraordinary size, particularly the sturgeon, salmon, and pike. The very best of these fish cost, on the banks of the Ural, not more than a half-penny, or three farthings a pound. The day when the fishery begins, the governor has the fish, which the Cossacks send as a present to the emperor, chosen from among the whole number, and sends them without delay to St. Petersburg, where they arrive quite frozen. The quantity is fixed, and it is said to be very considerable. In summer the Cossacks also carry on the fishery; but it is far less productive, and, as the fish will not keep in this season, the Cossacks salt them immediately, and send them to the neighbouring towns for sale.’ The whale and seal fishery is chiefly prosecuted in the Arctic Ocean.

Among the exports of Russian *commerce*, are iron, copper, hemp, flax, linen, sail-cloth, cordage, grain, tobacco, linseed, saltpetre, and oil; with timber, planks, masts, pitch, tar, resin, pot-ash, wax, tallow, hides, candles, isinglass, kaviar, and horse-hair. Leather is the most important manufacture exported, and the greatest endeavours are used to keep the method by which it is prepared a secret. For these articles the Russians receive in return silks, woollen, and cotton cloth, hardware, looking-glasses, stockings, watches, wines, brandy, and fruits from southern Europe, with colonial produce, paper, books, engravings, &c., from England, and other states. It is estimated that one-half of the trade of Russia is carried on within the confines of the capital. The trade of Russia with Persia is by means of the Caspian, and the caravans that travel to Orenburg, a few degrees north of that sea. The chief articles are woollens, furs, iron, steel, copper, lead, and other native productions. Russia receives in return silk, cotton, drugs, tapestry, gold, pearls, and diamonds. The trade of China is carried on from the frontier of Siberia, and consists in the exchange of furs, iron, copper, and other minerals, for Chinese silks, tea, musk, tiger skins, and a few other articles.

The annual amount of this commerce is between 3,000,000 and 4,000,000 of rubles. With Turkey, the Russians exchange kaviar, soap, leather, iron, and other produce, for olive oil, wines, rice, and fruits. Of the whole foreign European trade of Russia more than half is with Great Britain, the different articles of which have been specified above.

We may now exhibit the comparatively modern rise and progress of the maritime greatness of Russia. At the close of the seventeenth century, when Peter the Great ascended the throne, Russia was still in a state of barbarism, in comparison with the other nations of Europe. This prince possessed from nature a great activity of disposition, an impatient ardor, and a perseverance which obstacles only served to stimulate. With such a character it was natural that Peter should form the project of improving his subjects, and of making Russia act a part amongst the nations of Europe; but to this effect it was necessary to have suitable communications with the ocean, and the procuring them was the first object of the enterprises of the czar. He first turned his views towards the White Sea, and in person visited Archangel; but observing that its distance, and the severity of its climate, opposed insurmountable obstacles to any considerable extension of industry and commerce, his next object was the Black Sea, situated under a more favorable climate, but of which the coasts were possessed, and the navigation watched with jealousy by the Turks. A war breaking out between the two nations, Peter attacked Azoph, but failed in the attempt, for want of vessels to block it by water. A fleet being, however, quickly created, the following year put him in possession of this fortress and its territory, but which the defeat of Pruth again obliged him to relinquish.

Peter now seriously occupied himself in the creation of a navy; and, in order to give full effect to his designs, he visited, as we have seen in his life, England, Germany, and Holland, in order to acquire a knowledge of the art of constructing vessels, and of the details of a marine. During his travels the activity and opulence of Riga, Königsberg, and other ports of the Baltic, did not fail to strike him, and to give him a just idea of the importance of maritime commerce. Not far from the frontiers of his dominions he met Augustus, who, on being raised to the throne of Poland, had promised his subjects to reconquer the Polish provinces, reduced under the dominion of Sweden; but, being too weak to execute this promise alone, he proposed a coalition to the czar. A perspective conformable to the views of Peter now presented itself; and on his return to his dominions he armed, and the coasts of the Baltic became the theatre of his efforts. While Charles XII. was overrunning Poland and Saxony, Peter seized on Ingria, and founded Petersburg.

In spite of the superiority of situation, and the encouragement given to foreigners to visit his infant capital, a great part of the productions of Russia were still sent to Archangel, until, prohibitions and punishments being added to premiums and privileges Petersburg at last triumphed.

The first foreign vessel that entered the Neva was a large Dutch ship, richly laden; and her arrival caused such satisfaction to the czar that he granted this vessel an exemption from all duties while she should continue to trade to Petersburg; and by frequent repairs she was kept in existence for more than half a century. So early as 1718 100 ships of the same nation loaded at Petersburg; and, other nations following the example of the Dutch, it was soon known that a vast field was opened in the north for the exercise of talents and industry, and strangers of all nations flocked to Russia to improve or seek their fortunes. The merchants of Germany, England, France, Holland, Denmark, and Sweden, established themselves in the cities for the purposes of commerce, while the English and Dutch also supplied ship-builders and officers, both of land and sea, who improved the organisation of the armies and fleets.

The plans of Peter were not lost sight of by his successors; Catharine II., in particular, by her victories and her negotiations, as well as by the encouragement of foreigners and the protection of commerce, accelerated the progress of industry and civilisation amongst her subjects.

Although a part of the commercial productions of the Russian dominions are still exported from Archangel, and another part from the ports of the Black Sea, since its navigation has been opened, the principal commerce of Russia is by the Baltic. From its ports on this sea are exported corn, hemp, flax and flax-seed, fir timber (masts, deals, rafters), pitch, tar, and potash, iron and copper of Siberia, hides and tallow, honey and wax, rhubarb, tobacco in leaf, fish oil, isinglass, kaviar, and furs of Siberia, viz. castors, sables, foxes of various colors, wolves, squirrels, bears, rats, and white hares. In 1793 Russia exported by sea, for 400,000 rubles of these furs; sea-birds' feathers, horse-hair, hogs' bristles, and neats' tongues. The chief manufactured objects are saltpetre, cordage, and sail-cloth; coarse linens, mats, and soap. The principal imports are English manufactures, viz. fine woollens, glass, and earthenware, stationary, all kinds of cottons, mathematical instruments, cutlery, and hardware, tin and lead. The other imports are colonial produce, particularly coffee, of which Petersburg imports nearly 1,500,000 lbs.; sugar, of which it receives nearly 5,000,000 lbs.; tea and spices, wines, liqueurs, fruits, and oil of the south; fine linens of Holland and Silesia; silks of France, watches, toys, &c., of ditto, besides various utensils of iron and copper.

In the middle of the eighteenth century the exports of Russia from the Baltic did not exceed 12,000,000 or 13,000,000 of rubles, and the imports about 8,000,000 or 10,000,000. At the close of the same century the exports exceeded 45,000,000, and the imports were above 32,000,000. The general statement of the Russian maritime commerce (independently of the Caspian and Siberian Seas*) was as follows:—

* The amount of the commerce of the Caspian Sea, in late years, has been about 100,000 rubles of exports, and 800,000 of imports.

	Exports.	Imports.
	Rubles.	Rubles.

Catharine II., by duties and prohibitions, endeavoured to diminish the mass of imports; and, by late regulations, certain objects are allowed to be imported by foreigners only into the ports of Petersburg, Riga, Revel, and Liebau. But, though the manufactures of Russia have advanced beyond the state of infancy they were in half a century past, they are still very insufficient to afford all the objects that increasing civilisation renders necessities to the higher classes, such as fine manufactures for clothing, wines, ornamental furniture, &c.

Russia presents a singular phenomenon among the maritime powers, that of possessing an imposing military marine with a very insignificant commercial one. The total number of her merchant vessels that navigate the Baltic and the ocean did not very lately exceed fifty; 100 lesser vessels serve to carry on the coasting trade of the Baltic, and about 100 craft, of twenty to thirty tons, are employed in loading and discharging the vessels at Cronstadt that cannot enter the Neva. Not one of the Russian ports, except Petersburg, has any establishments for building or repairing ships. Even the few ships that sail under the Russian flag from Riga and Revel belong to the merchants of Hamburg and Lubeck, who, in order to profit by the drawback of three-eighths of the duties on imports, have purchased the freedom of these cities.

Russia has two trading companies, one for carrying on the herring-fishery in the White Sea, and the North-west American Company. A company has also been founded at Petersburg for saving the cargoes of vessels wrecked in the gulf of Finland; and the fourth part of the property saved is adjudged to the company as salvage. Several ukases also prescribe to the inhabitants of the coasts the measures to be taken to assist the crews and save the cargoes of the stranded vessels.

Under the immediate successors of Peter the Great the Russian navy was neglected, and had little more than a nominal existence. When Catharine II. mounted the throne, this ambitious and enlightened princess again invited English and other foreign ship-builders and officers to Petersburg; and among the English was Sir Charles Knowles, a captain in the British navy, who united the professional knowledge of the complete practical seaman to an intimate acquaintance with the theory of naval construction. Under his direction the Russian marine was

soon put on a respectable footing, and many of the abuses in its civil administration corrected. Towards the end of Catharine's reign the marine again declined, but revived under Paul, who built many ships, and introduced several improvements into the administration. The Russian dominions afford every article necessary to the construction and equipment of a navy. At Cronstadt and Petersburg the ships are built of the oak of Kasan; the Ukraine and government of Moscow supply hemp; masts are procured from the vast pine forests of Novogorod, and from the Polish provinces; pitch and tar from Wyborg; iron and copper from Siberia. In spite of all these advantages the marine is far from having attained a height proportionate to the land forces of the empire. The want of ports on the ocean, and of colonies and fisheries abroad, as well as the state of vassalage of the peasantry, which binds them to the soil, are the chief causes that keep down the military marine, as well as the commercial, by preventing the formation of seamen. The government has, however, latterly done something towards forming national seamen, by obliging all Russian ships to have two-thirds of their crews natives; and binding the captains, under a penalty of 240 rubles, to bring back to port every Russian seaman he carries from it. There is, however, no restriction with respect to the countries of the captains and officers of merchant vessels; and the greater number of those in the Russian foreign traders are foreigners. It has also been latterly the custom to send young men, at the expense of the crown, into the English service to learn the profession, and they have been admitted into the British navy as volunteers.

In 1803 a school of naval architecture was founded at Petersburg, the expenses of which are paid by government, and amount to upwards of 200,000 rubles a year. There is also a similar institution at Nicolaef in the Black Sea. The palace of Oranienbaum has been appropriated for a naval academy, in which 600 cadets are educated at the expense of the crown. They are admitted at the age of five years, and remain till seventeen: during the last three years they make an annual cruise in the Baltic, as far as Revel. There are also navigation schools at Riga, Archangel, and Irkutsk in Siberia, and a school for Baltic pilotage at Cronstadt.

The government of Russia is a despotic monarchy; the sovereign uniting in himself the legislative, executive, and judicial authorities. Any subject, from the highest to the lowest, may be banished, and his property confiscated, at the pleasure of the czar. The succession appears to be hereditary; but one prince has often been deposed and another raised to the throne without exciting any commotion. The emperor is generally assisted, however, by a number of ministers and counsellors of his own appointing. The grand chancellor is the first officer of state; and under him are ministers for foreign affairs, finances, war, marine, interior, religious worship, public instruction, and police. The different councils in which the ministers preside are styled imperial colleges: the members, with a number of other statesmen appointed by the

emperor, amounting altogether to thirty-five, compose the supreme council, which is invested with a superintending and controlling power over all the public affairs. The senate is another public body, established by the late emperor in 1801, and of which his imperial majesty is the president. This body has the revision of both civil and criminal affairs. It receives reports from all the inferior departments, decides in every difficult case that arises in the tribunals; and from its decrees there lies no appeal except to the emperor. All questions are determined in this body by a majority of votes, amounting to two-thirds of the whole: in the other departments unanimity is necessary. The senate is the organ of the decrees or ukases of the emperor. The cabinet is a distinct council from any of the above, and has generally consisted of ten members, including the high steward of the household. This council manages his majesty's private affairs, examines petitions, despatches, and accounts, and watches over the produce of the revenue. It also assists the emperor in deliberating on the appeals received from the senate.

The civil law in Russia is a collection of rules derived from most of the other states of Europe, and methodised under the direction of Catharine II. She divided the empire into provinces, and adopted a variety of regulations for the better administration of justice. Courts are now established in each of the provinces, and judges appointed by the crown. But an impartial administration of justice cannot be introduced between the nobles who are tyrants, and the peasants, slaves. The criminal law admits of capital punishment for high treason only; and the humanity of the emperor Alexander induced him to abolish torture. Felons receive the knout, are branded on the cheek and forehead, and sentenced to hard labor. Many of them are sent to the mines of Siberia, where numbers perish from the effects of the knout, the fatigue of travelling nearly 5000 miles in fetters, and the unhealthy state of the mines.

The nominal force of the *army* is 600,000; but in time of peace one-fifth or one-sixth of this number is non-effective, and at least an equal number are required for garrison duty. At the beginning of 1812 the utmost exertions of the emperor could not bring into the field more than 200,000 men. The navy we have already noticed.

According to the most authentic accounts the *revenue* of Russia is nearly £25,000,000 sterling, arising chiefly from a poll tax, first imposed by Peter the Great; a tax on the capital of merchants residing within the imperial dominions; duties on the exports and imports, and upon law proceedings; together with the produce of the royal domains and monopolies. There are likewise stamp duties, and various other imposts.

The established *religion* is the Greek church, and has been fully described in our article GREEK CHURCH. There are about 2,000,000 of separatists, with a great number of Mahometans and Pagans, as well as Protestants and Roman Catholics, to all of whom complete toleration is allowed. The most singular of the sects is the Duhoborsti, who, after many persecutions, have

been allowed to settle undisturbed in Taurida. They have neither priests, church, nor pictures; and reject both baptism and the Lord's supper. They are sober, industrious, and gentle, and distinguished by mutual affection, hospitality, and benevolence. They take great care to bring up their children in the principles and precepts of religion. Their worship is confined neither to place nor time, and consists of singing, praying, and reading the scriptures. They have all things in common, and their only punishment for those who have transgressed the rules of the society is banishment from the community.

Education was much neglected in Russia till a late period; for though various schools, academies, and colleges were instituted, their benefits were confined to certain classes, and their influence was little felt on the general condition of society. A great number of schools have been established, in the different provinces, for the education of the peasants. The academies and universities have been improved or remodelled, and more amply endowed with funds, for the liberal support of the professors, and the better accommodation of the students, the number of whom has been greatly increased. The Russian language is a dialect of the Slavonian, harsh and difficult of utterance, but it is said to possess great copiousness. The alphabet comprises thirty-six letters, formed of the Greek characters, with others apparently of native origin. The language, however, is far from being in a precise form.

Dr. Clarke says, 'in whatever country we seek original genius we must go to Russia for a talent of imitation. It is the scheme of Russian intellect; the principle of all their operations. They have nothing of their own; but it is not their fault if they have not every thing that others invent. Their surprising powers of imitation exceed all that has hitherto been known. The meanest Russian slave has been found adequate to the accomplishment of the most intricate and most delicate works of mechanism, to copy, with his single hand, what has demanded the joint labors of the best workmen in France or England.' Mr. James (in reference to this subject)—'Newly extricated from barbarism, the infant mind is seized with the desire of pursuing whatever strikes the fancy, or serves to interest or amuse, while the labors of more rigid science and learning are entirely thrown aside. We find at Petersburg few men of abstruse acquirements, yet musicians, poets, and painters in abundance; and the nation has arrived in these arts, it must be confessed, at a highly reputable pitch of perfection. The works of art, though not fraught with the spirit of originality of the southern professors, yet display in almost every branch the most correct and refined taste; and even the natives shine, while the prejudices of their countrymen have denied them a fair share of patronage. The academy of arts is fostered by the superintendence of the crown; and, from the revenues allotted to it, it is well furnished with models from the antique, as well as other matters suited to its institution. The labors of the students exhibit some of the highest specimens of imitative excellence; their designs in architect-

ture are of great merit, and their pictures possess a free style of execution, combined with chasteness and harmony of color, seldom equalled in any school.' Their music is framed in the Italian state. Many of the national airs are extremely simple and regular. The cultivation of science has been encouraged by the establishment of various institutions for that purpose; and several volumes of the memoirs of the Academy of Sciences, founded at St. Petersburg in 1725, have been distinguished by the excellence of their papers in the abstruse parts of mixed mathematics. The chief Russian universities are those of St. Petersburg, Kiev, and Abo, with the colleges founded by Peter the Great at Moscow.

More than eighty distinct nations are said to be included within the limits of this empire, and thus exhibit man in every state of his physical and moral condition, from the being who lives on the produce of the chase, clothed in the skins of his prey, and sheltered in the recess of a rock, or the wandering Nomade, who pitches his tent to-day, removes it to-morrow, and is entirely dependent upon the produce of his flock, through the humble peasant, the industrious husbandman, the ingenious mechanic, the wealthy merchant, the owners of almost unknown estates, and the proprietors of men, to the autocrat of all the Russias. The Slavonians constitute the great body of the population of European Russia: this part of the empire embraces, beside Fins and Laplanders on the north-west, the Samoides on the north-east; the Cossacks on the south, and the Tartars of Taurida on the south-east. The Slavonic Russians are middle-sized, robust, and vigorous, differing little in complexion from the inhabitants of Great Britain. Those towards the north are a more diminutive race. Their characteristic physiognomy, according to Mr. Tooke, is a small mouth and eyes, thin lips, and white teeth, the nose usually small and turned upwards, the forehead low, the beard thick and bushy, and the hair varying from dark brown to red. The general expression of the countenance is that of gravity rather than sprightliness, but indicating much good-nature. Accustomed to implicit obedience from the nature of the government, and trained to the endurance of hardships and privation from their manner of life, they seem neither to fear danger, nor shrink from fatigue, are subject to few diseases, and frequently attain old age. With the same general features the women have a delicate skin and a fine complexion, which they often destroy by a free use of paint. 'On looking at their faces you easily discern the Tartar and Kalmuc ingraftation upon the old Moscovite stock. The visage is short, the bones of the cheek high, the forehead projecting, and the eyes small. Their stature is commonly of the middle size; and, from their habits of life, both men and women are inclined to be very corpulent. When a tinge of the Georgian Poles and Circassians mingles with the Russian blood, the result is the most exquisite beauty.'

The whole people of Russia may be said to consist only of two distinct orders, the nobles and the peasants. The interval between these has been denominated a tiers etat; but, as far as

relates to all the practical purposes of life, it is filled up by foreigners, who once enjoyed all the lucrative branches of commerce, in which only a few of the natives as yet participate. 'The privileges of a nobleman consist in being exempted from military conscription, and from corporal punishment; in having the right to establish manufactories, to possess land and slaves, to impose taxes, and to inflict chastisement upon them, &c. The charges on this class are to furnish recruits to the crown, and to pay a certain fee on the alienation of their property. Besides those who enjoy the above-mentioned rights by inheritance, these advantages are attached to certain stations in the civil and military lines; assessors in the chancery, for instance, and all officers of the army or navy, are called nobles, though the possession of slaves is limited to persons above the rank of major. The imperial companies of trade at Petersburg also participate in certain of these immunities, and are allowed to use carriages with one pair of horses. But even the nobility can neither marry, nor choose a profession, without the emperor's consent. Their estates are valued by the number of peasants they support. Several of the nobility possess more than 100,000 peasants; the property belonging to the family of Scheremeter consists of 125,000 slaves. Both in their privileges, and in their manner of life, these nobles seem to be exact copies of the great feudal barons of the middle ages. Many of them, in the country, have households consisting of 500 or 600 peasants, who perform all the various duties of butchers, bakers, tailors, shoemakers, footmen, valets, surgeons, musicians, and comedians; for which they are selected without discrimination. Their destinations are determined upon, and they are then qualified for them by the cudgel.'—James's Travels.

Dr. Clarke exhibits a lively picture of the effect of the extremes of poverty and riches in this empire.

'To this poverty, and to these riches, are equally joined,' he says, 'the most abject meanness, and the most despicable profligacy. In sensuality they are without limits of law, conscience, or honor; in their amusements always children; in their resentment women. The toys of infants, the baubles of French fops, constitute the highest objects of their wishes. Novelty delights the human race; but no part of it seeks for novelty so eagerly as the Russian nobles. Novelty in their debaucheries; novelty in gluttony; novelty in cruelty; novelty in whatever they pursue. This is not the case with the lower class, who preserve their habits unaltered from one generation to another. But there are characteristics in which the Russian prince and peasant are the same. They are all equally barbarous. Visit a Russian, of whatever rank, at his country seat, and you will find him lounging about, uncombed, unwashed, unshaven, half-naked, eating raw turnips, and drinking quass. The raw turnip is handed about in slices, in the first houses, upon a silver salver, with brandy, as a whet before dinner. The real Russian rises at an early hour, and breakfasts on a dram with black bread. His dinner, at noon, consists of the coarsest and most greasy viands, the scorbutic effects of which

are counteracted by salted cucumbers, sour cabbage, the juice of his vaccinium, and his nectar quass. Sleep, which renders him unmindful of his abject servitude and barbarous life, he particularly indulges; sleeping always after eating, and going early to bed. The principal articles of diet are the same every where, grease and brandy.

A uniform costume is seen in all parts of Russia, only differing in quality as it is worn in the country or the capital. In the one it is a sheepskin tunic, fastened round the waist with a girdle; in the other of cloth, plaited behind like a petticoat. The hair is cut in one shape, and the lower part of the face is always hid by a beard. The females retain much of Asiatic finery and gaudy robes. They wear a saraphan, or vest without sleeves, fitting close about the neck, down to the hips, and reaching to the feet. A row of close-set buttons usually adorns the front, and it is girt round the waist with a sash, to which the keys in common use are suspended. In some parts the females wear their hair bound up with a riband, or band, which crosses the forehead, and which is often decorated with pearls and beads of various colors: in others they wear caps made in the form of an upright crescent. In the vicinity of Moscow, and in some of the adjacent parts of the country, the cap has a front resembling that worn by the English jockey, studded with pearls or beads. The houses of the peasants are all of rough logs of wood, and in villages these are uniformly placed with their ends to the street. The walls have their interstices stopped with moss. The whole family sleep in the same room, reclining on mats, straw, or sheepskins, and in the clothes they wear during the day. The favorite place at night is on the edge of the stove, which is raised above the floor with a few bricks.

A peculiar custom of Russia is the frequent use of the warm bath, with which the meanest hamlets are provided. The heat they sustain on these occasions would be almost insupportable to other people. It is usually from 100° to 130° of Fahrenheit's thermometer; and the vapor is renewed every five minutes, by water thrown on hot stones. Such is the effect of habit on the constitution of the Russians that they frequently sally forth from these steam caldrons, and plunge immediately into cold water, or roll in the snow; and male and female, old and young, not only of the same family, but even of the same village, all assemble in the bath together.

We must conclude this part of our paper with a sketch of the mode of travelling peculiar to Russia: we mean the extensive and skilful use of sledges. Sometimes a body, like that of a coach, is placed on a sledge, which unites the advantage of repose with the convenience of rapid motion. In this manner eighty or 100 miles a day are performed. And hence the Russian prefers the winter for his long journeys. In summer travelling is far more tedious and fatiguing by the badness of the roads, which are often composed of rough logs of wood, laid transversely on beams. Of his passage over one of the large rivers, Mr. James says, 'Nothing could be more strikingly wild than our passage

over the Ypoote. A raft of trees loosely pinned together was provided; a rope, made from the bark of trees, served for its draught; on either bank of the river rose a vast forest, not thick and luxurious, but bared in many a line by the progress of age and decay; amidst its shades were seen the white shirts and black fur caps of the Tartars, as they scampered along in the wantonness of sport, with their horses at full speed; their caravan, just arrived, was ranged on the river side, and the oxen were seen, every now and then, as the raft put off, plunging into the stream, and swimming to the opposite shore.'

SOUTHERN RUSSIA is largely inhabited by the Cossacks, who present the singular anomaly of a free people in the midst of abject slavery. As free as a Cossack is a common proverb in Russia. They have been acknowledged as a distinct race for more than nine centuries; and, according to their different emigrations and settlements, are at present distinguished by the names of Malo-Russian Cossacks, Don Cossacks, Cossacks of the Black Sea, of the Volga, of Grebenskoy, of Orenburg, of the Ural Alps, and of Siberia. The subsequent remarks, chiefly confined to those within the European part of the empire, are principally derived from Dr. Clarke's Travels.

The ramifications of the Cossack republic, for such it is, extend into various parts of a vast despotic government, which considers it a matter of policy to guarantee their privileges. Nor do the Cossacks afford a greater contrast with the Russians in their political existence than in their personal appearance and individual character. These people are thus contrasted by the intelligent author above referred to, and who had excellent opportunities of witnessing the two nations. In reference to the Cossacks of the Don and the Black Sea, he says, 'The Russian regards both with aversion, and affects to consider them beneath his notice, and unworthy of his society, for no other assignable reason than ignorance or envy. The Cossack is rich, the Russian poor. The Cossack is high-minded, the Russian abject. The Cossack is for the most part clean in his person, honorable, valiant, often well informed, and possesses, with his loftiness of soul, a very noble stature; the Russian is generally filthy, unprincipled, dastardly, always ignorant, and rarely distinguished by any elevation of mind or body.' Many of those vast steppes in the vicinity of the Don, which appear as blanks in our best maps, are said to be filled with Cossack abodes. Stanitzas, or settlements, are formed along all the rivers by which they are intersected; and the late bishop Heber states that the procurator (who is a person appointed by the Russian government to superintend the execution of the laws) affirmed to him that the whole number of Cossacks liable to be called upon for active service amounted to 200,000 men. The entire male population is reckoned at 500,000. 'There is something extremely martial, and even intimidating, in the first appearance of a Cossack. His dignified and majestic look; his elevated brows and dark mustachoes; his tall helmet of black wool, terminated by a crimson sash, with its plume, and white cockade; his upright posture; the ease

and elegance of his gait; give him an air of great importance. We found them in considerable numbers at Kasankaia, lounging before their houses, and conversing in such large parties that it seemed as if we were entering their capital. Their dresses were much richer than any we had seen in Russia, although all were uniform. Each person's habit consisted of a blue jacket, edged with gold, and lined with silk, fastened by hooks across the chest. Beneath the jacket appeared a silk waistcoat, the lower part of which was concealed by the sash. Large and long trousers, either of the same material as the jacket, or of white dimity, kept remarkably clean, were fastened high above the waist, and covered the boots. The sabre is not worn, except on horseback, on a journey, or in war. In its place is substituted a switch, or a cane, with an ivory head: this every Cossack bears in his hand, as an appendage to his dress; being at all times prepared to mount his horse at a moment's notice. Their cap or helmet is the most beautiful part of the costume, because it is becoming to every set of features. It adds considerably to their height, and gives, with the addition of whiskers, a military air to the most insignificant figure. They wear their hair short round the head, but not thin upon the crown. It is generally dark, thick, and quite straight. The cap is covered by a very soft and shining black wool. Some of them have civil and military distinctions of habit, wearing, in time of peace, instead of the jacket, a large frock without buttons. The sash is sometimes yellow, green, or red, though generally black, and they wear large military gloves. There is no nation in the world more neat with regard to dress; and, whether young or old, it seems to become them all. A quiet life seems altogether unsuited to their disposition. They loiter about, having no employment to interest them; and, passionately fond of war, seem distressed by the indolence of peace. The territory of the Cossacks, which is almost entirely pasture land, is divided into stanitzas, or cantons; for many stanitzas now contain more than a single village. To each of these a certain portion of land and fishery is allotted by government, and an allowance of corn from Voronetz, and northwards according to the returned number of Cossacks. They are free from all taxes; even from those of salt and distilleries. The distribution of the land to individuals in each stanitzas is settled by the inhabitants and their Ataman. This Ataman was chosen by the people, and was both civil and military commander of the place; but he is now appointed by the crown, and greatly diminished in power; formerly the Ataman himself marched at the head of his stanitzas: now he merely sends the required contingent, which is put under officers named by the crown. The allotment of land and fishery which each Cossack possesses may be let out by him to farm, and often is so. The Cossack, in consequence of his allowance, may be called upon to serve for any term not exceeding three years, in any part of the world, mounted, armed, and clothed, at his own expense, and making good any deficiencies that may occur. Food, lay, and camp equipage, are furnished by go-

vernment. Those who have served three years are not liable, at least not usually called upon, to serve abroad, except on particular emergencies. They serve, however, in the cordon along the Caucasus, and in the duties of the post and police. After twenty years they become free from all service, except the home duties of police, and assisting in the passage of corn barks over the shallows of the Don. After twenty-five years' service they are free entirely.'

The Cossacks and other inhabitants of Tchérchaskoy export fish, iron, kaviar, and a little wine: their merchants going to war, like the rest of their countrymen, and the greater number of their superior officers being merchants. In the capital they live a pleasant and agreeable life, and have often public amusements, as balls and parties of pleasure.

The Cossacks are said to be favorably contrasted with the other inhabitants of Russia as to cleanliness both in their persons and houses. The dress of the females differs from all the other costumes of Russia; and its magnificence is displayed in the ornaments of the cap. The hair of the married women is tucked under the cap, which is adorned with flowers, or covered with pearls and gold. The dress of the young women is elegant; a silk tunic with trousers fastened with a girdle of solid silver, yellow boots, and an Indian handkerchief round the head. 'The common dress of men in Tchérchaskoy is a blue jacket, with a waistcoat and trousers of white dimity; the latter so white and spotless that they seem always new. We never saw a Cossack in a dirty suit of clothes. Their hands, moreover, are always clean, their hair free from vermin, their teeth white, and their skin has a healthy and cleanly appearance. Polished in their manners, instructed in their minds, hospitable, generous, disinterested, humane, and tender to the poor, good husbands, good fathers, good wives, good mothers, virtuous daughters, valiant and dutiful sons; such are the natives of Tchérchaskoy. In conversation the Cossack is a gentleman; for he is well informed, free from prejudice, open, sincere, and honorable.'

The following account of the religious ceremonies of this people is from Dr. Clarke:— 'The morning after our arrival (at Axay) the general, who was commander-in-chief over all the district, including the town of Tchérchaskoy, the metropolis, came to Axay. The day was celebrated as a festival, in honor of the recovery of one of the emperor's children from the small pox inoculation. He sent us an invitation to dinner; and in the forenoon we accompanied him, with all the staff officers, to a public ceremony in the church. On entering this building we were much surprised at its internal magnificence. The screen of the altar was painted of a green color, and adorned with gold: before it was suspended a very large chandelier, filled with tapers of green wax. The screen, like the rest of the church, was covered with pictures: some of these were tolerably well executed, and all of them curious from their singularity and the extraordinary figures they served to represent. Here were no seats as in other Russian churches. The general placed himself against a wall on the

right hand facing the sacristy, standing on a step covered with a carpet, and raised about four inches from the level of the floor. We were directed to place ourselves by his right hand. The other Cossacks, whether in military uniform or national domestic habit, stood promiscuously in the body of the church. The priest, in very rich robes, with his back towards the people, was elevated upon a kind of throne, placed beneath the chandelier, and raised three steps from the platform, facing the great doors of the sacristy : these were shut. Over them was a picture of the Virgin ; and before it, suspended by a string, were two wooden angels, joined back to back, like the figures of Janus, with candles in their hands. Whenever the doors of the sacristy were thrown open, the wooden angels were lowered before the centre of the entrance : here they whirled round and round in a most ludicrous manner. As the ceremony began, the priest, standing upon the throne, loosened a girdle bound across his breast and shoulders, whereon was an embroidered representation of the cross. This he held between his forefinger and thumb, repeating the service aloud, and touching his forehead with it, while the people sang responses, and were busied in crossing themselves. The vocal part of the ceremony was very solemn. The clear shrill notes of children placed among the choristers, rising to the dome of the church, and seeming to die away in the air, had a most pleasing effect. It is the same in all the Russian churches, and I know not any thing with which it can more justly be compared than the sounds produced by an Æolian harp. The words they use are Russian, and every where the same, ' Lord have mercy upon us ! ' We did not find them altered even among the Cossacks ; it was still ' Ghospodi pomilui ! ' but thrilled

' In notes with many a winding bout
Of linked sweetness long drawn out.'

' At last there was an interval of silence, after this, other voices, uttering solemn airs, were heard within the sacristy. The doors were then thrown open, and a priest, having upon his head a silver chalice, containing the sacred bread, covered with a white napkin, made his appearance. He was preceded by others, who advanced with censers, dispersing incense over the doors of the sacristy, the pictures, the priest, the general, the officers, and the people. After some ceremonies, the bread was distributed among the congregation ; then, those who came out of the sacristy having retired, its doors were again closed, and prayers were read for all the royal family ; their names being enumerated in a tone of voice and manner exactly like that of a corporal or serjeant at a roll-call. Passages were also read from the Psalms ; but the method of reading in all the Russian churches is beyond description. The young priests who officiate pride themselves upon mouthing it over with all possible expedition, so as to be unintelligible, even to Russians ; striving to give to the whole lesson the appearance of a single word of numberless syllables. Some notion may be formed of their delivery, by hearing the criers in our

courts of justice administer the oath to a jury.'

HISTORY.—Russia was anciently inhabited by various nations ; such as Huns, Scythians, Sarmatians, Cimbri, &c., of whom an account is given under the various detached articles. The origin of the Russians themselves, though not prior to the ninth century, is covered with almost impenetrable obscurity ; partly owing to the ignorance and barbarity of the people, and partly to the policy which long prevailed among them of discouraging all accounts of their origin, and enquiries into their ancient state and situation ; of which we have a remarkable instance in the modern suppression of a work by professor Muller, entitled *De Originibus Gentis et Nominis Russorum*. According to several authors of credit, the Russians derived their origin from the Slavi or Slavonians, corruptly called the Selavonians, who settled first along the banks of the Volga, and afterwards near the Danube, in Bulgaria and Hungary ; but, being driven thence by the Romans (whom the Russians call Wolochers, or Wolotaners), they first removed to the banks of the Borysthenes or Dnieper, then overran Poland, and built the city of Kiow. Afterwards they extended their colonies farther north, to the rivers which run into the Ilmen Lake, and laid the foundation of the city of Novogorod. The towns of Smolensk and Tsernikow appear also to have been built by them. The most ancient inhabitants, not only of Russia, but of all Siberia to the borders of China, are called Tshudi : for professor Muller, who, on enquiring in those parts by whom the ancient buildings and sepulchral monuments he saw there were erected, was every where answered that they were the works of a people of this name. In the ninth century the Scandinavians, that is, the Danes, Norwegians, and Swedes, emigrated from the north, and, crossing the Baltic, went to seek habitations in Russia. They first subdued the Courlanders, Livonians, and Estonians ; and, extending their conquests still farther, exacted tribute from the Novogorodians, settled kings over them, and traded as far as Kiow, and even to Greece. These new invaders were called Waregers, which, according to Muller, signifies seafaring people ; or, if derived from the old northern word war, it signifies warlike men. To these Waregers the name of Russes, or Russians, is thought by the most eminent authors to owe its origin ; but the etymology of the word itself is uncertain. In these dark ages Russia was divided among a great number of petty princes, who made war upon each other with great ferocity and cruelty, so that the whole country was reduced to the utmost misery ; when Gostomisel, a chief of the Novogorodians, pitying the unhappy fate of his countrymen, and seeing no other method of remedying their calamities, advised them to offer the government of their country to the Waregers. The proposal was readily accepted, and three princes of great abilities and valor were sent to govern them ; namely, Ruric, Sincus, and Truwor, said to have been brothers. The first took up his residence at Ladoga, in the principality of Great Novogorod ; the second at Bielo Osero, or the White Lake ; and the third kept his court at Isborsk,

or, according to others, at a small town then called Twertzog, in the principality of Pleskow. The three brothers reigned amicably, and made considerable additions to their dominions; all of which at length devolved on Ruric by the death of Sincus and Truwor.

RUSSIA, UNDER THE RACE OF RURIC.—Ruric became zealous for the strict administration of justice, and issued a command to all the boyars who possessed territories under him to exercise it in an exact and uniform manner. To this end it was necessary there should be general laws: and this leads us to conclude that letters were not entirely unknown in his dominions. The Russian empire continued to flourish till the end of the reign of Wolodomir, who ascended the throne in 976. Having settled the affairs of his empire, he demanded in marriage the princess Anne, sister to the Greek emperor Basilus Porphyrogenitus. His suit was granted, on condition that he should embrace Christianity. With this the Russian monarch complied; and that vast empire was thenceforward considered as belonging to the patriarchate of Constantinople. Wolodomir received the name of Basilus on the day on which he was baptised; and, according to the Russian annals, 20,000 of his subjects were baptised on the same day. Michael Syra, or Cyrus, a Greek, sent by Photius the patriarch of Constantinople, was accepted as metropolitan of the whole country. At the same time Wolodomir put away all his former wives and concubines, of whom he had upwards of 800, and by whom he had twelve sons, who were baptised on the same day with himself. The idols of paganism were now thrown down, churches and monasteries were erected, towns built, and the arts began to flourish. The Slavonian letters were now first introduced into Russia; and Wolodomir sent missionaries to convert the Bulgarians; but only three or four of their princes came to him and were baptised. These events happened in the year 987. Wolodomir called the arts from Greece, cultivated them in the peaceable periods of his reign, and rewarded their professors with generosity, that he might dispel the clouds of ignorance which enveloped his country, call forth the genius of his countrymen, and render them happy. He also founded public schools, and enacted a law concerning the method of instructing youth, and directing the conduct of the masters appointed to instruct them. He died in 1008, and, contrary to all rules of sound policy, divided his empire among his twelve sons.

Wolodomir was no sooner dead than his sons commenced a civil war. Suantepolk, one of the brothers, having destroyed and seized upon the dominions of two others, was himself driven out by Jarislaus, and obliged to fly to Boleslaus king of Poland. This brought on a dreadful war betwixt the Poles and Russians, in which the former were victorious, and the latter lost a great part of their dominions, as related under **POLAND**. Jarislaus, finding himself unable to oppose the king of Poland, now turned his arms against the rest of his brothers, all of whom he dispossessed of their dominions, and seized them for himself. He next attacked the Cos-

sacks, over whom he gained several advantages; after which he ventured once more to try his fortune with Boleslaus; but in this second expedition he was attended with worse success than before, being now reduced to the condition of a vassal and tributary to the victorious monarch. However, in the reign of Mieczislaus II. the successor of Boleslaus, the Russians again shook off the yoke, and a lasting peace was confirmed by the marriage of Mieczislaus with the sister of Wolodomir. Jarislaus now continued to enjoy the empire quietly; and devoted a great part of his time, we are told, to study. He invited men of letters to his court, and caused many Greek books to be translated into the Russian language. In 1019 he gave the people of Novogorod several laws, under the title of Gramota Soudebnaja, to be observed in the courts of justice. These are the first laws that are known to have been reduced to writing in Russia; and what renders them remarkable is the conformity they have to those of the other northern nations. He founded a public school at Novogorod, where he maintained and educated 300 children at his own expense. His court was the most brilliant of the north, and furnished an asylum to unfortunate princes. He died in 1052.

Jarislaus fell into the same error which his father had committed, by dividing his dominions among his five sons. This produced a repetition of the bloody scenes which had been acted by the sons of Wolodomir; the Poles took advantage of the distracted state of affairs to make continual inroads and invasions; and the empire continued in the most deplorable situation till 1237, when it was totally subdued by the Tartars. Innumerable multitudes of these barbarians headed by their khan Batto, after ravaging great part of Poland and Silesia, broke suddenly into Russia, where they committed the greatest cruelties. Most of the Russian princes, among whom was the great duke George Sevolditz, were made prisoners, and racked to death; and, in short, none found mercy but such as acknowledged themselves the subjects of the Tartars. The imperious conqueror imposed upon the Russians every thing that is most mortifying in slavery; insisting that they should have no other princes than such as he approved of; that they should pay him yearly a tribute, to be brought by the sovereigns themselves on foot, who were to present it humbly to the Tartarian ambassador on horseback. They were also to prostrate themselves before the haughty Tartar; to offer him milk to drink, and, if any drops of it fell down, to lick them up: a singular mark of servility, which continued nearly 260 years.

George Sevolditz was succeeded by his brother Michael Sevolditz Zernigouski; who opposed the Tartars, but was defeated by them, and lost his life. He left three sons, Theodore, Alexander, and Andrew, whose wars with each other ended in the death of them all. Alexander, a son of Alexander, was then placed on the throne by the Tartars; and his son Daniel removed his court from Wolodomir to Moscow, where he first assumed the title of great duke of Wolo-

dimir and Moscow. Daniel left two sons, Gregory and John; the former of whom, named Kalita, from a purse he used always to carry about him filled with money for the poor, ascended the throne; but he was soon assassinated by another prince named Demetrius, who was himself put to death for it by the Tartars; and John, likewise surnamed Kalita, was then made czar. This John left three sons, John, Simon, and Andrew; and the eldest of these, commonly called Ivan Ivanovitz in the barbarous language of Russia, i. e. John, the son of John, was made czar, with the approbation of the Tartars, on whom he was dependent. During these several reigns, which occupied upwards of 100 years, the miseries of a foreign yoke were aggravated by all the calamities of intestine discord and war; whilst the knights of Livonia, or brothers of the short sword, as they are sometimes called, a kind of military order of religious, on one side, and the Poles on the other, attacked Russia, and took several of its towns, and some considerable countries. The Tartars and Russians, whose interests were in this the same, often united to oppose their common enemies, but were generally worsted. The Livonians took Pleskow; and the Poles made themselves masters of Black Russia, the Ukraine, Podolia, and the city of Kiow. Casimir the Great, one of their kings, carried his conquests still farther. He claimed a part of Russia, in right of his relation to Boleslaus duke of Halitz, who died without issue, and took the duchies of Perzemyssia, Halitz, and Luckow, and the districts of Sanock, Lubackzow, and Trebowla; all which countries he made a province of Poland. See **POLAND**.

The newly conquered Russians were ill disposed to brook the government of the Poles, whose laws and customs were more contrary to their own than those of the Tartars had been. They joined the latter to rid themselves of the yoke, and assembled an army numerous enough to overwhelm all Poland, but destitute of valor and discipline. Casimir, undaunted by this deluge of barbarians, presented himself at the head of a few troops on the borders of the Vistula, and obliged his enemies to retire. Demetrius, the son of John, who commanded in Moscow, made frequent efforts to rid himself of the galling yoke. He defeated in several battles Majmay, khan of the Tartars; and, when conqueror, refused to pay them any tribute, and assumed the title of great duke of Muscovy. But the oppressors of the north returned in greater numbers than before; and Demetrius, at length overpowered, after a struggle of three years, perished with his whole army, which amounted to 240,000 men. His son, Basilus, revenged his father's death. He attacked his enemies, drove them out of his dominions, and conquered Bulgaria. He made an alliance with the Poles, whom he could not subdue; and even ceded to them a part of his country, on condition that they should help him to defend the rest against any new incursions of the Tartars. But this treaty was a weak barrier against ambition. The Russians found new enemies in their allies, and the Tartars soon returned. Basilus had a son

named Basilus, to whom the crown ought to have descended. But the father, suspecting his legitimacy, left it to his own brother Gregory, a man of a severe and tyrannical disposition, and therefore hated by the people, who asserted the son's right, and proclaimed him their sovereign. The Tartars took cognizance of the dispute, and determined it in favor of Basilus; upon which Gregory had recourse to arms, drove his nephew from Moscow to the principality of Uglitz, and usurped his throne. Upon the death of Gregory, Basilus returned to Moscow; but Andrew and Demetrius, sons of the late usurper, laid siege to that city, and obliged him to retire to the monastery of Troitz, where they took him prisoner, with his wife and son, and put out his eyes: hence the appellation of jennoi, the blind. The subjects of this unfortunate prince, incensed at the cruel treatment he had received, forced the perpetrators of it to fly to Novogorod, and reinstated their lawful sovereign at Moscow, where he died. In the midst of this general confusion, John I., the son of Basilus, by his invincible spirit and refined policy, became both the conqueror and deliverer of his country, and laid the first foundation of its future grandeur.

Observing with indignation the narrow limits of his power at his accession to the throne, after the death of his father, he began immediately to revolve within himself the means of enlarging his dominions. Marriage seemed to him one of the best expedients he could begin with; and accordingly he demanded and obtained Maria, sister of Michael duke of Twer, whom he soon after deposed, under pretence of revenging the injuries done to his father, and added this duchy to his own territories of Moscow. Maria, by whom he had a son named John, who died before him, did not live long; and upon her death he married Sophia, daughter of Thomas Palæologus, who had been driven from Constantinople, and forced to take shelter at Rome, where the pope portioned this princess, in hopes of procuring thereby great advantage to the Romish religion; but his expectations were frustrated, Sophia being obliged to conform to the Greek church after her arrival in Russia. John doubtless hoped by this marriage to establish a claim to the empire of the east, to which her father was the next heir: and the Russians certainly owed to this alliance their deliverance from the Tartar yoke. Shocked at the servile homage exacted by those proud victors, her husband going to meet their ambassadors at some distance from the city, and standing to hear what they had to say, whilst they were at dinner, Sophia told him that she was surprised to find that she had married a servant to the Tartar. Nettled at this reproach, John feigned himself ill when the next deputation from the Tartars arrived, and under that pretence avoided a repetition of the stipulated humiliating ceremonial. Another circumstance equally displeasing to this princess was that the Tartars had, by agreement, within the walls of the palace at Moscow, houses, in which their ministers resided; to show their power, and at the same time watch the actions of the great duke. To get rid of these, a formal embassy

was sent to the Tartarian khan, to tell him, that Sophia having been favored with a vision from above, ordering her to build a temple in the place where those houses stood, her mind could not be at ease till she had fulfilled the divine command; and therefore his leave was desired to pull them down, and give his people others. The khan consented: the houses within the kremlin were demolished; and, no new ones being built, the Tartar residents were obliged to leave Moscow, their prince being prevented from revenging this breach of promise, by a war he was engaged in with the Poles. John taking advantage of this circumstance, and having considerably increased his forces, disclaimed all subjection to the Tartars, attacked their dominions, and made himself master of Casan, where he was solemnly crowned with the diadem of that kingdom, which is still used for the coronation of the Russian sovereigns. The province of Permia, with great part of Lapland and Asiatic Bulgaria, soon submitted to him; and Great Novogorod was reduced by his generals after a seven years' siege, and yielded him 300 cart loads of gold and silver, and other valuable effects. Alexander Witold, waiwode of Lithuania, was in possession of this rich place, from which he had exacted for some years an annual tribute of 100,000 rubles, a prodigious sum for those days in that country. When it was taken by John Basiltowitz, he, to secure his conquest, put it under the protection of the Poles, voluntarily rendered himself their tributary for it, and accepted a governor from the hand of their king Casimir III., a weak prince, from whom he had nothing to fear. The Novogorodians continued to enjoy all their privileges till about two years after; when John, ambitious of reigning without control, entered their city with a numerous retinue, under pretence of keeping to the Greek faith, he being accused of an intention to embrace the Romish religion; and, with the assistance of the archbishop Theophilus, stripped them of all their remaining riches. He then deposed the treacherous prelate, and established over Novogorod new magistrates, creatures of his own; thus destroying at once a noble city, which, had its liberties been protected, and its trade encouraged, might have proved to him an inexhaustible fund of wealth. All the north beheld with terror and astonishment the rapid increase of the victor's power: foreign nations courted his alliance; and the petty princes of Russia submitted to him without resistance. The Poles, however, complained loudly of this breach of faith in regard to Novogorod, and threatened revenge; upon which John, elated with his successes, with the riches he had amassed, and the weak condition of most of his neighbours, sent a body of troops into Lithuania, and soon became master of several of its towns. Casimir applied for assistance to Matthias king of Hungary; but was answered that his own soldiers were quite undisciplined; that his auxiliaries had lately mutinied for want of pay; and that it was impossible for him to raise a new army out of the neighbouring countries. The Polish monarch in this distress was obliged to purchase of John a cessation of arms for two years, during which the

Muscovite made new accessions to his dominions. The dukes of Servia, whose territories were about 500 miles in extent, had long thought themselves ill used by the Lithuanians on account of their religion, which was that of the Greek church; and wanted to withdraw from this subjection to Poland, and put themselves under the protection of Russia. An accident afforded them the wished for pretence. Their envoys, arriving at Wilna, desired admittance to the king's presence; which being refused one of them endeavoured to force his way in; but the porter shut the door rudely against him, and in so doing broke one of his fingers. The porter was immediately put to death; but the Servians, not satisfied, returned home in great fury, and prevailed upon their countrymen to submit to the Muscovites. Casimir made several attempts to recal them, but to no purpose. Matthias king of Hungary dying about this time, two of his sons, Uladislau, then king of Bohemia, and John Albert, contended for his vacant crown. Casimir wished to give it to the latter, whom he assisted to the utmost of his power; and, though he was in great want of men and money, he purchased a renewal of the truce with the Russians, and thereby gave John time to establish himself in his new acquisitions. Casimir died in 1492, and was succeeded on the throne of Poland by his son John Albert, who, totally disregarding the Russians, involved himself unnecessarily in a war with the brave Stephen duke of Moldavia; and, though he had at the same time both the Tartars and Turks against him, his propensity to pleasure rendered him so indolent that he not only did not attempt to molest John in any of his possessions, but concluded a peace with him on terms very advantageous to the latter; and even entered into a treaty, by which he stipulated not to assist the Lithuanians, though they had chosen his brother Alexander for their duke, in case the Russians should attack them. Alexander, to parry the inconveniences of this agreement, and to guard against the designs of his enemies, demanded in marriage John's daughter, Helena, by his second wife Sophia, and obtained her. The Lithuanians then expected tranquillity; but the ambitious czar, (for John had assumed that title since his conquest of Casan,) soon found a pretence to break with his new allies, by alleging that Polish Russia, as far as the river Berezhina, had belonged to his ancestors, and therefore was his by right, and that Alexander had engaged to build a Greek church at Wilna for his Russian consort, which instead of doing, he had endeavoured to force the Polish Russians to become Roman Catholics. In consequence of this plea, he sent into the territories of his son-in-law, by different ways, three armies, which reduced several places, destroyed the country about Smolensko, and defeated the Lithuanian field marshal Ostrosky near the river Wedrasch, where he fell unawares into an ambush of the Russians. Alexander raised a new army of Silesians, Bohemians, and Moravians; but they came too late, the Russians having retired with their plunder. Elated by their success they invaded Livonia in 1502, with 130,000 men; but Walter Von Plettenberg, grand-master of the knights of the cross, with only 12,000 men,

gave them a total overthrow ; killing 10,000 of them with little loss on his own side. John dispirited by this defeat, and being engaged in a war with the Tartars, the Poles, and the city of Pleskow, immediately despatched an embassy to Plettenberg, and concluded a truce with him for fifty years. At the same time he begged of that general to send to Moscow, that he might see him, one of the *iron* dragoons, as he called them, who had performed wonders in the late engagement. Von Plettenberg readily complied ; and the czar rewarded the cuirassier's accomplishments with considerable honors and presents. Alexander had been elected king of Poland upon the death of his brother John Albert, in 1501, but the Poles refused to crown his consort Helena, because she adhered to the Greek religion. Provoked at this affront, and probably still more stimulated by ambition, John resolved again to try his fortune with them : and accordingly ordered his son Demetrius to march against Smolensko, and reduce that city. The young prince did what he could, but the vigorous resistance of the besieged, and the arrival of the king of Poland with a numerous army, obliged the Russians to raise the siege and return home ; and the czar was glad to make a fresh truce with the Poles for six years, upon the easy terms of only returning the prisoners he had taken. Neither the czar nor Demetrius long survived this event ; for Sophia, who had gained an absolute ascendant over her husband, and wanted to give the sovereignty to her children, persuaded him to set aside and imprison his grandson Demetrius, the only child of the late John, whom he had by his first wife Maria, and declare her eldest son Gabriel his successor. The czar blindly followed the iniquitous advice ; but shortly after, finding his end approach, he sent for young Demetrius, expressed great remorse for his barbarity, and on his death-bed declared him his lawful successor. He died in November 1505, after a reign of fifty-five years ; leaving behind him an immense territory, chiefly of his own acquiring.

The czar was no sooner dead than his son Gabriel, at the instigation of his mother Sophia, put an end to the life of the young Demetrius, by confining him in prison, where he perished with hunger and cold ; after which Gabriel was crowned by the name of Basilus, and took the title of czar. On his accession he expected that the Poles would be in confusion about the election of a new sovereign ; but, being disappointed by their unanimous election of Sigismund I. (see POLAND), he sent an army into Lithuania, and laid siege to Smolensko. It made a brave resistance, till news arrived that the crown troops of Poland were coming to their assistance, with 30,000 Crim Tartars ; on which the Russians retreated with precipitation, but were quickly followed by the Poles, who reduced the czar to submit to their own terms. Basilus remained quiet for some time ; after which he, with a numerous army, encamped near Pleskow, where the Poles, presuming on the late treaty, received him as a friend. But the Muscovite priests, of the Greek church, preaching up that it would be advantageous to have a sovereign of their own re-

ligion, brought them to such a height of enthusiasm that they murdered their magistrates, and opened their gates to the czar, who made them all slaves, banished them to different parts, and filled the city with Muscovites, to secure his conquest. Soon after he took Smolensko ; and the Swedes, alarmed at his rapid progress, desired a prolongation of the truce for sixty years longer. The duchy of Lithuania was the great object of Basilus ; to accomplish which he ordered John Czeladin, a man enterprising even to rashness, to march thither with 30,000 men. The army of the Poles did not exceed 35,000 men, but was commanded by a most experienced general. The two armies met on the opposite banks of the Dneiper, near Orsova, and the Poles passed that river in sight of their enemies. The Lithuanians began the attack, but were repulsed by the Russians, who, imprudently following them, became at once exposed to the full fire of the enemy's artillery. The Polish cavalry then rushed in among them and made dreadful havoc. Those who endeavoured to fly were drowned in the Dneiper ; and the rest, including Czeladin himself, were made slaves. Basilus was at Smolensko, when he received the news of this dreadful defeat ; on which he immediately fled to Moscow where his danger increased daily. The Crim Tartars ravaged his dominions, and the emperor Maximilian, with whom he had been in alliance, deserted him ; his troops were defeated in Livonia, where he was obliged to submit to a peace on dishonorable terms. In the mean time, the king of Poland stirred up the Tartars to invade Russia, while the Russian monarch endeavoured to excite them to an invasion of Poland. These barbarians, equally treacherous to both parties, first invaded and ravaged Podolia in Poland ; and then invaded Russia, defeated the armies of the czar in 1521, and quickly made themselves masters of Moscow. An army which had been sent to oppose their progress was defeated near the Oeca ; and the czar's brother Andrew, who commanded it, was the first who fled. Basilus with great difficulty made his way to Novogorod ; but so terrified that he hid himself by the way under a haycock, to avoid a party of the enemy. The Tartars, however, soon obliged him to sign a writing, by which he acknowledged himself their vassal, and promised to pay them a tribute of so much a head for every one of his subjects. Besides this, Machmet Gerei, the commander of the Tartars, caused his own statue to be set up at Moscow, as a mark of his sovereignty ; compelled Basilus to return to his capital, to bring thither in person the first payment of this tribute, and, as a token of his submission, to prostrate himself before his statue. Machmet Gerei then left Moscow, and returned home with an immense booty, and upwards of 80,000 prisoners, who were made slaves, and sold like cattle to the Turks. In his way back he attempted to take the city of Rezan ; but was repulsed with considerable loss by John Kowen, who commanded in that place for the Russians. Here the Tartar general narrowly escaped with his life, his coat being shot through with a musket ball ; and the Muscovites pulled down his statue, and broke it to pieces as soon as the con-

querors had left them. Basilius died in 1533, and was succeeded by his son John Basiliowitz II., an infant of five years of age.

During the minority of John II. his two uncles Andrew and George endeavoured to deprive him of the crown; but their attempts were defeated by the activity of his guardians. The Poles also commenced hostilities, but made little progress. John, as soon as he entered his nineteenth year, showed a desire to rescue his subjects out of that desperate state of ignorance and barbarism in which they had been hitherto immersed. He sent a splendid embassy to the emperor Charles V., who was then at Augsburg, to desire the renewal of a treaty of friendship which had been concluded with his father Maximilian, and offering to enter into a league with him against the Turks, as enemies to the Christian religion; for his farther information in which, particularly in regard to the doctrine and ceremonies of the Latin church, he requested that his ambassador might be allowed to send from Germany to Russia proper priests to instruct him and his subjects. With these he likewise desired to have some wise and experienced statesmen, able to civilize the wild people under his government; and also, the better to help to polish them, he requested that he would send mechanics and artists of every kind; in return for all which he offered to furnish two tons of gold yearly, for twenty years together, to be employed in the war against the Turks. The emperor readily agreed, and the Russian ambassador accordingly engaged upwards of 300 German artists, to repair to Lubec, and proceed thence to Livonia. But the Lubeckers, who were very powerful at that time, and aimed at nothing less than the engrossing of the whole commerce of the north, stopped them, and represented strongly to the emperor, in the name of all the merchants in Livonia, the dangerous consequence of thus affording instructions to the Russians, who would soon avail themselves of it to ruin their trade, and distress the subjects of his imperial majesty. The workmen and others intended for Russia were easily prevailed upon to return home; and the czar's ambassador was arrested upon his arrival at Lubec, and imprisoned there at the suit of the Livonians: however he escaped soon after; and the czar, though provoked at the Lubeckers, was obliged to suspend his resentment. His first enterprise was against the Tartars at Casan, who had hitherto been such formidable enemies. In this he was attended with success: the whole territory was conquered in seven years; but the capital, Casan, being well fortified and bravely defended, made such resistance as quite disheartened the besiegers. John, hearing of this, hastened to them with considerable reinforcement, and exhorted them to push the siege with redoubled vigor. But the greater part, deaf to his remonstrances, proceeded to mutiny, and fell upon their comrades who were for continuing the war. John, alarmed at this, rushed in among the combatants, and with difficulty parted them; but neither menaces nor entreaties, nor even a promise of the whole plunder of the city if they took it, could prevail on them to continue the war. Their rage at last prompted

them to threaten the life of their sovereign, who was obliged to make the best of his way to Moscow; and the mutineers instantly returned thither. John, though justly incensed at this insolence, took a method of punishing it which does honor to his humanity. Having selected a guard of 2000 of his best troops, he ordered a great feast, to which he invited his principal nobles and officers, to each of whom, according to the Russian custom, he gave very rich garments. The chief of the seditious were clothed in black velvet; and after the dinner was over he made a speech to the whole company, setting forth the behaviour of his troops before Casan, their contempt of his commands, and their conspiracy against his life: to which he added that he was doubly sorry to find the instigators of such wickedness among those who were styled, and who ought to be, his faithful counsellors; and that those who knew themselves to be guilty of such atrocious wickedness could not do better than voluntarily to submit themselves to his mercy. Upon this most of them immediately threw themselves at his feet, and implored his pardon. Some of the most criminal were executed, but the rest were only imprisoned. Immediately after this John marched with a fresh army to reinvest Casan, before the Tartars had time to recover themselves. The besieged still made an obstinate defence, and the Russians again began to be dispirited; upon which the czar ordered his pioneers to undermine the walls of the citadel, a practice then unknown to the Tartars. This work being completed, he directed his priests to read a solemn mass to the whole army, at the head of which he afterwards spent some time in prayer, and then ordered fire to be set to the powder, which acted so effectually that great part of the foundation was immediately blown up, and the Muscovites, rushing into the city, slaughtered all before them; while the astonished Tartars, crowding out at the opposite gate, crossed the Casanka, and fled into the forests. Among the prisoners taken on this occasion were Smeon king of Casan, with his queen; both of whom were sent to Moscow, where they were treated with the utmost civility and respect. Encouraged by this success, John invaded the country of Astracan, the capital of which he soon reduced; after which he prepared to revenge himself on the Livonians for their behaviour in stopping the German artists. John Basiliowitz I. had concluded a truce with this people for fifty years; which now being expired, Iodocus, archbishop of Dorpt and canon of Munster, sensible of the danger to which he was exposed by the vicinity of the Russians, requested the czar to give him a prolongation of the truce. John offered him the alternative of a truce for five years, upon payment of one-fifth of a ducat for each person in Dorpt; or for twenty years, on condition that he and the Livonians should rebuild all the Russian churches which had been demolished in their territories, and allow his subjects the free exercise of their religion. Iodocus evaded an answer, but at last levied a considerable sum, and fled with it to Munster, where he resigned his prebend and married. His successor, named Herman, and

the deputies from Livonia, accepted of conditions, and swore to observe them; with this additional clause, that the priests of the Romish communion should be exempted from paying tribute. But, while the Livonians swore to these terms, they were at that very time in treaty with Gustavus Vasa, king of Sweden, to join them in attacking Russia. Gustavus complied with their desires; upon which John invaded Finland. Gustavus advanced against him with a powerful army; but, as neither the Poles nor Livonians gave him any assistance, he was obliged to conclude a treaty with the czar, and soon after to evacuate the country. Finland was then governed by William of Furstenberg, grand master of the Livonian knights and the archbishop of Riga; between whom a quarrel happened about this time, which facilitated John's designs. The archbishop, after attempting to set himself above the grand master even in civil affairs, and to persecute those who adhered to the confession of Augsburg, chose for his coadjutor in the archbishopric of Riga Christopher duke of Mecklenburg. From the abilities and haughty temper of this lord the Livonian knights had reason to fear the worst; and the step was, besides, unprecedented, and contrary to the established laws. These discontents were heightened by letters intercepted from the archbishop to his brother Albert, duke of Prussia, inviting this last to suppress the order of Livonian knights, and to secularise their possessions; so that an open war broke out among the contending parties, and the archbishop was seized and made prisoner. He was, however, soon released, through the mediation of the emperor of Germany and other potentates, backed by the powerful preparations of the Prussians to avenge his cause; but in the mean time, the strength of their country being totally exhausted, the Livonians were obliged, instead of preparing for war, to sue to the czar for peace. John replied that he did not believe their intentions to be sincere while they kept 6000 Germans in pay; and, therefore, if they meant to treat of peace, they must begin with dismissing these troops. The Livonians did as they were ordered; and in 1558 an army of 100,000 Russians entered the district of Dorpt, and laid every thing waste with the most shocking cruelty. After this they entered the territories of Riga, where they behaved with equal inhumanity; and, having at last satiated themselves with blood and treasure, they retired with an immense booty and a great number of prisoners. The Livonians, now convinced of their own folly in provoking the rage of the Russians, sent ambassadors to sue for peace. These offered the czar a present of 30,000 ducats, and prevailed upon him to grant their nation a truce for four months, during which they returned home to get the money. But in this interval the Livonian governor of the city of Nerva fired some cannon against Ivanogorod or Russian Nerva, on the opposite side of the river, and killed several of the czar's subjects who were quite unarmed. The Russians, out of regard to the truce, did not attempt to make reprisals, but immediately acquainted John with it; which so incensed the czar that, when the Livonian ambassadors arrived, he told them he looked upon

their nation to be a set of perjured wretches, who had renounced all honesty; that they might go back with their money and proposals, and let their countrymen know that his vengeance would soon overtake them. The ambassadors were scarcely arrived in Livonia when an army of 300,000 Russians entered the district of Nerva, under Peter Sisegaledrii, who had been a famous pirate in the Euxine Sea. He took Nerva in nine days, and soon made himself master of Dorpt, where he found immense treasures. Several other garrisons, terrified by the approach of such numbers, quitted their posts; so that the Russians became masters of a great part of Livonia almost without opposition. At last Gothard Kettler, grand master of the knights of Livonia, entreated Christian III. king of Denmark, to take Riga, Revel, and the countries of Garmland, Wirrland, and Esthonia, under his protection; but, from his advanced age, he declined the offer, though he assisted them with money and powder, of which they stood greatly in need. Having then applied to the emperor of Germany and the court of Sweden, Kettler put himself under the protection of the Poles, who had hitherto been such formidable enemies to the Russians. In the mean time the latter pursued their conquests; took the city of Marienburg, laid waste the district of Riga, destroyed Garmland, and penetrated to the very gates of Revel. Felin, though provided with the best artillery in the whole country, became theirs by the treachery of its garrison; and William of Furstenberg, the old grand master, was taken, and ended his days in a prison at Moscow. The distracted situation of the Livonian affairs now reduced the bishop of Oesel to sell his bishopric to Ferdinand king of Denmark, who exchanged it with his brother Magnus for a part of Holstein. The districts of Revel and Esthonia put themselves under the protection of Sweden; and the grand master, finding himself deserted by all, suppressed the order of which he was the chief, and accepted of the duchy of Courland, which he held as a fief of the crown of Poland. The czar saw with pleasure the division of Livonia between the Swedes and Poles, which, he rightly judged, would produce quarrels between the two nations, and thus give him the fairer opportunity of seizing the whole. In 1564 the Swedes offered him their assistance against the Poles; but he, judging himself strong enough without them, attacked the Poles with his own forces, but was twice defeated, which checked his farther operations in Livonia. In 1569 he entered into a treaty of commerce with England, captain Richard Chancellor having recently discovered a passage to Archangel in Russia, through the White Sea, by which that empire could be supplied with foreign goods, without the assistance of Poland or Livonia. To the discoverers of this new passage John granted many exclusive privileges; and after the death of queen Mary I. renewed the alliance with queen Elizabeth, which has been continued without interruption ever since. In the mean time, however, a prodigious army of Turks and Tartars entered Muscovy, with a design to subdue the whole country; but Zerebrinov, the czar's general, having attacked them in a defile, put them to flight with great slaughter. They then

retired towards the mouth of the Volga; but, being closely pursued by the Russians and Tartars, they were again defeated, and forced to fly towards Azof on the Black Sea, which they found ruined by the blowing up of a powder magazine. The Russians then attacked their ships there, took some, and sunk the rest; by which means almost the whole army perished either with hunger or sword. From this time the empire of Russia became so formidable that none of the neighbouring nations could expect to make a conquest of it. The Poles and Swedes indeed continued to be very formidable; and, by the instigation of the former, the Crim Tartars, in 1571, again invaded the country with an army of 70,000 men. The Russians, who might have prevented their passing the Volga, retired before them till they came within eighteen miles of Moscow, where they were totally defeated. The czar no sooner heard this news than he retired with his most valuable effects to a well fortified cloister; upon which the Tartars entered the city, plundered it, and set fire to several churches. A violent storm of wind soon spread the flames all over the city, which was totally burnt in six hours, though its circumference was upwards of forty miles. The fire likewise communicated itself to a powder magazine at some distance from the city; by which accident upwards of fifty roods of the city wall, with all the buildings upon it, were destroyed; and, according to the best historians, upwards of 120,000 citizens were burnt or buried in the ruins, besides women, children, and foreigners. The castle, however, which was strongly fortified, could not be taken; and the Tartars hearing that a formidable army was coming against them under John Magnus, duke of Holstein, whom John had made king of Livonia, thought proper to retire. The war, nevertheless, continued with the Poles and Swedes; and the czar, being defeated by the latter after some trifling success, was reduced to the necessity of suing for peace. But, the negotiations being somehow or other broken off, the war was renewed with vigor. The Livonians, Poles, and Swedes, having united against the Russians, gained great advantages over them; and in 1579 Stephen Batori, then king of Poland, levied an army to invade Russia, and regain all that Poland had formerly claimed, which indeed was little less than the whole empire. As the Poles understood the art of war much better than the Russians, John found his undisciplined multitudes unable to cope with the regular forces of his enemies; and their conquests were so rapid that he was soon obliged to sue for peace, which, however, was not granted: and the number of enemies which now attacked Russia might probably have conquered it entirely, had not the allies grown jealous of each other. The consequence was that, in 1582, a peace was concluded with the Poles, in which the Swedes were not comprehended. However the Swedes, finding themselves unable to effect any thing of moment after the desertion of their allies, concluded a truce; after which the czar, having been worsted in an engagement with the Tartars, died in 1548. This great prince was succeeded by his son Theodore; a man of such weak under-

standing that he was totally unfit for government. Under him, therefore, the Russian affairs fell into confusion; and Boris Gudenov, a nobleman whose sister Theodore had married, assumed all the authority. At last he resolved to usurp the throne. For this purpose he caused the czar's brother Demetrius, who was only nine years of age, to be assassinated, and afterwards caused the czar also to be murdered. In 1597 the czar himself was taken ill and died, being poisoned by Gudenov; of which indeed the czarina was so well convinced that she would never afterwards speak to her brother. With Theodore ended the line of Ruric, who had governed the empire of Russia for above 700 years.

II. RUSSIA, TILL THE ELECTION OF THEODORE III. OF THE HOUSE OF ROMANO V.—Boris, who in reality was possessed of all the power, and would indeed have suffered nobody else to reign, artfully pretended to be unwilling to accept the crown, till compelled to it by the intreaties of the people; and even then he put the acceptance of it on the issue of an expedition which he was about to undertake against the Tartars. The truth of the matter, however, was, that no Tartar army was in the field, nor had Boris any intention of invading that country; but by this pretence he assembled an army of 500,000 men, which he thought the most effectual method of securing himself in his new dignity. Boris, in 1600, concluded a peace with the Poles, but resolved to continue the war against the Swedes; however, being disappointed in some of his attempts against that nation, he entered into an alliance with the Swedish monarch, and even proposed a match between the king's brother and his daughter. But, while these things were in agitation, the city of Moscow was desolated by one of the most dreadful famines recorded in history. Thousands of people lay in the streets and highways, with their mouths full of hay, straw, or even the most filthy things, which they had been attempting to eat. In many houses the fattest person was killed, in order to serve for food to the rest. Parents were said to have eaten their children, and children their parents, or to have sold them to buy bread. One author, Petrius, says that he himself saw a woman bite several pieces out of a child's arm as she was carrying it along: and Margaret relates that four women, having ordered a peasant to come to one of their houses, under pretence of paying him for some wood, killed and ate both him and his horse. This dreadful calamity lasted three years, notwithstanding all the means which Boris could use to alleviate it; and in this time upwards of 500,000 people perished in the city. In 1604 a young man appeared, who pretended to be Demetrius, whom Boris had caused to be murdered. Being supported by the Poles, he proved very troublesome to Boris all his lifetime; and after his death deprived his son Theodore II., the new czar, of the empire; after which he ascended the throne himself, and married a Polish princess. However he held the empire but a short time, being killed in an insurrection of his subjects; and the unhappy czarina was sent prisoner to Jaroslaw. After the death of Demetrius, Zuski, who had conspired against him, was chosen czar; but rebellions

continually taking place, and the empire being perpetually harassed by the Poles and Swedes, in 1610 Zuski was deposed, and Uladislaua son of Sigismund king of Poland was elected. However, the Poles representing to Sigismund that it would be more glorious for him to be the conqueror of Russia than only the father of its sovereign, he carried on the war with such fury that the Russians in despair fell upon the Poles, who resided in great numbers at Moscow. The Poles being well armed, and mostly soldiers, had greatly the advantage; however, they were on the point of being oppressed by numbers, when they fell upon the most cruel method of insuring their success that could be devised. This was by setting fire to the city in several places; and, while the distressed Russians ran to save their families, the Poles fell upon them sword in hand. In this confusion upwards of 100,000 people perished; but the event was that the Poles were finally driven out, and lost all footing in Russia. The expulsion of the Poles was succeeded by the election of Theodore Romanov, a young nobleman of seventeen years of age, whose posterity still continue to enjoy the sovereignty. He died in 1646, and was succeeded by his son Alexis.

III. RUSSIA UNDER THE HOUSE OF ROMANOV. —The reign of Alexis was almost one continued scene of tumult and confusion, the empire being harassed on all sides by external enemies, and perpetually disturbed by internal commotions. The sources of these commotions arose from the multiplicity and inconsistency of the laws, and the jarring claims of the border nobles. An eman-
noy ukase, or personal order of the sovereign, signed with his own hand, is to this day the law of Russia. These edicts are as various as the opinions, prejudices, passions, or whims of men; and in the days of Alexis they produced endless contentions. To remedy this evil, he made a selection from all the edicts of his predecessors, of such as had been familiarly current for 100 years; presuming that those either were founded in natural justice, or during so long a currency had formed the minds of the people to consider them as just. This digest, which he declared to be the common law of Russia, and which is prefaced by a sort of institute, is the standard law book at this day, known by the title of the Ulogenié or Selection; and all edicts prior to it were declared to be obsolete. He soon made his Novellie, however, more bulky than the Ulogenié; and the additions by his successors are beyond enumeration. This was undoubtedly a great and useful work; but Alexis performed another still greater. Though there are many courts of judicature, in this widely extended empire, the emperor has always been lord paramount, and could take a cause from any court immediately before himself. But as several of the old nobles had the remains of principalities in their families, and held their own courts, the sovereign or his ministers, at a distance up the country, frequently found it difficult to bring a culprit out of one of these hereditary feudal jurisdictions, and try him by the laws of the empire. This was a very disagreeable limitation of imperial power; and the more so, that some families claimed even a right to repledge. A

lucky opportunity offered of settling this dispute; and Alexis embraced it with great ability. Some families on the old frontiers were taxed with their defence, for which they were obliged to keep regiments on foot; and, as they were but scantily indemnified by the state, it sometimes required the exertion of authority to make them keep up their levies. When the frontiers, by the conquest of Casan, were far extended, those gentlemen found the regiments no longer burdensome, because, by the help of false musters, the former scanty allowance much more than reimbursed them for the expense of the establishment. The consequence was that disputes arose among them about the right of guarding certain districts, and law-suits were necessary to settle their respective claims. These were tedious and intricate. One claimant showed the order of the court, issued a century or two back to his ancestor, for the marching of his men, as a proof that the right was then in his family. His opponent proved that his ancestors had been the real lords of the marches; but that, on account of their negligence, the court had issued an eman-
noy ukase to the other, only at that particular period. The emperor ordered all the family archives to be brought to Moscow, and all documents on both sides to be collected. A time was set for the examination; a fine wooden court-house was built; every paper was lodged under a good guard; the day was appointed when the court should be opened and the claims heard; but that morning the house, with all its contents, was in two hours consumed by fire. The emperor then said, 'Gentlemen, henceforward your ranks, your privileges, and your courts, are the nation's, and the nation will guard itself. Your archives are unfortunately lost, but those of the nation remain. I am the keeper, and it is my duty to administer justice for all and to all. Your ranks are not private, but national, attached to the services you are actually performing. Henceforward colonel Buturlin (a private gentleman) ranks before captain Viazemsky (an old prince).' This constitution, which established the different ranks of Russia, as they remain to this day, is by Voltaire ascribed to Peter; but it was the work of Alexis, who, when the situation of himself and his country is considered, must be allowed to have been a great and a good man. He died in 1676.

Alexis was succeeded by his son Theodore IV., who after an excellent reign, during the whole of which he exerted himself to the utmost for the good of his subjects, died in 1682, having appointed his brother Peter I., commonly called the Great, his successor. See PETER I. Theodore had another brother named John; but, as he was subject to the falling sickness, the czar had preferred Peter, though very young, to the succession. But through the intrigues of the princess Sophia, sister to Theodore, a strong party was formed in favor of John; and soon after both John and Peter were proclaimed sovereigns of Russia under the administration of Sophia, who was declared regent. But the princess regent conspired against Peter, and, being discovered, was confined for life in a convent. From this time also John continued to be only a nominal sovereign till his death, which

happened in 1696, Peter continuing to engross all the power. To this emperor Russia has long ascribed the whole of her present greatness. The private character of Peter, however, seems to have been very indifferent. Though he had been married in his eighteenth year to a young and beautiful princess, he was not restrained by the vows of wedlock; and was besides so much addicted to the pleasures of the table, the prevailing vice of his country, that nobody could have imagined him capable of effecting the reformation which he accomplished. In spite of all disadvantages, however, he applied himself to the military art and to civil government. He had also a very singular dread of water, which, had it not been conquered, would have rendered him for ever incapable of accomplishing what he afterwards did. When he was about five years of age, his mother went with him in a coach in the spring season; and passing over a dam where there was a considerable water-fall, whilst he lay asleep in her lap, he was so suddenly awaked and frightened by the rushing of the water, that it brought a fever upon him; and after his recovery he retained such a dread of that element that he could not bear to see any standing water, much less to hear a running stream. This aversion, however, he conquered by jumping into water; and afterwards became fond of that element. Being ashamed of the ignorance in which he had been brought up, he learned almost of himself, and without a master, enough of the High and Low Dutch languages to speak and write intelligibly in both. He looked upon the Germans and Dutch as the most civilised nations; because the former had already erected some of those arts and manufactures in Moscow which he was desirous of spreading throughout his empire, and the latter excelled in navigation. During the administration of the princess Sophia, he had formed a design of establishing a maritime power in Russia; which he accomplished by the means recorded in our memoir of him. Having reformed his army, and introduced new discipline, he led his troops against the Turks; from whom, in 1696, he took the fortress of Azof; and had the satisfaction to see his fleet defeat that of the enemy. On his return to Moscow were struck the first medals which had ever appeared in Russia. The legend was, 'PETER THE FIRST, the august emperor of Russia.' On the reverse was Azof, with these words '*Victorious by fire and water.*' Notwithstanding this success, however, Peter was much chagrined at having his ships all built by foreigners; having besides as great an inclination to have a harbour on the Baltic as on the Euxine. These considerations determined him to send some of the young nobility of his empire into foreign countries, where they might improve. In 1697 he sent sixty young Russians into Italy, most of them to Venice, and the rest to Leghorn, to learn the method of constructing their galleys. Forty more were sent to Holland, to be instructed in building and working large ships; others to Germany, to serve in the land forces, and to learn military discipline. At last he resolved to travel through different countries in person, that he might have the opportunity of profiting by his

own observation and experience. Of this journey we have given a short account in our memoir of him; and shall only add that, in executing his great design, he lived and worked like a common carpenter. He labored hard at the forges, rope-yards, and mills for sawing timber, manufacturing of paper, wire-drawing, &c. In acquiring the art of a carpenter he began with purchasing a boat, to which he made a mast himself, and by degrees executed every part of the construction of a ship. Peter went also from Sweden to Amsterdam, to attend the lectures of the celebrated Ruysch on anatomy. He likewise attended the lectures of burgo-master Witsen on natural philosophy. From this place he went to Utrecht, to visit king William III. of England; and on his return sent to Archangel a sixty gun ship, in the building of which he had assisted with his own hands. In 1698 he went to England, where he employed himself as he had done in Holland, and perfected himself in the art of ship-building; and, having engaged a great number of artificers, returned with them to Holland: whence he set out for Vienna, where he visited the emperor; and was on the point of setting out for Venice, to finish his improvements, when he was informed of a rebellion having broken out in his dominions. This was occasioned by the superstition and obstinacy of the Russians, who, having an almost invincible attachment to their old ignorance and barbarism, had resolved to dethrone the czar on account of his innovations. But Peter, arriving unexpectedly at Moscow, quickly put an end to their machinations, and took a most severe revenge on those who had been guilty. Having then made great reformatations in every part of the empire, in 1700 he entered into a league with the kings of Denmark and Poland against Charles XII. of Sweden. The particulars of this famous war are related under SWEDEN. Here we shall only observe that, from the conclusion of this war, Sweden ceased not only to be a formidable enemy to Russia, but even lost its political consequence in a great measure altogether. Peter applied himself to the cultivation of commerce, arts, and sciences, with equal assiduity as to war; and he made such acquisition of dominion, even in Europe itself, that he may be said, at the time of his death, to have been the most powerful prince of his age. He was unfortunate in the Czarovitz his eldest son, whom he contrived to get rid of by the forms of justice, and then ordered his wife Catharine to be crowned with the same magnificent ceremonies as if she had been a Greek empress, and to be recognised as his successor; which she accordingly was, and mounted the Russian throne upon the decease of her husband.

Catharine I. succeeded her husband in 1725, and carried into execution many of the great designs which he had left unfinished. See CATHARINE. She died after a short but glorious reign, in 1727, and was succeeded by Peter II. a minor, son to the Czarovitz Alexis. Many domestic revolutions happened in Russia during the short reign of this prince; but none was more remarkable than the disgrace and exile of prince Menzikoff, the favorite general in the two late

reigns, and esteemed the richest subject in Europe. See MENZIKOFF. Peter died of the small pox in 1730. See PETER II.

Notwithstanding the despotism of Peter the Great and his wife, the Russian senate and nobility, upon the death of Peter II., ventured to set aside the order of succession which they had established. The male issue of Peter was now extinct; and the duke of Holstein, son to his eldest daughter, was by the destination of the late empress entitled to the crown; but the Russians filled their throne with Anne duchess of Courland, second daughter to John, Peter's eldest brother; though her elder sister the duchess of Mecklenburg was alive. Her reign was extremely prosperous; and though she accepted of the crown under limitations that some thought derogatory to her dignity, yet she broke them all, asserted the prerogative of her ancestors, and punished the aspiring Dolgoroucki family, who had imposed upon her limitations, with a view, as it is said, that they themselves might govern. She raised her favorite Biron to the duchy of Courland; and was obliged to give way to many severe executions on his account. She died in 1740.

John, the son of the empress Anne's niece, the princess of Mecklenburg, by Antony Ulric of Brunswick Wolfenbittel, was, by her will, entitled to the succession; but, being only two years old, Biron was appointed to be administrator of the empire during his nonage. This destination was disagreeable to the princess of Mecklenburg and her husband, and unpopular among the Russians. Count Munich was employed by the princess of Mecklenburg to arrest Biron; who was tried, and condemned to die, but was exiled to Siberia. The administration of the princess Anne of Mecklenburg and her husband was, upon many accounts, but particularly that of her German connexions, disagreeable not only to the Russians, but to other powers of Europe; and, notwithstanding a prosperous war they carried on with the Swedes, the princess Elizabeth, daughter by Catharine to Peter the Great, formed such a party, that in one night's time she was declared and proclaimed empress of the Russias; and the princess of Mecklenburg, her husband, and son, were made prisoners. Elizabeth's reign may be said to have been more glorious than that of any of her predecessors, her father excepted. She abolished capital punishments, and introduced into all civil and military proceedings a moderation till her time unknown in Russia: but she banished the counts Munich and Osterman, who had the chief management of affairs during the late administration. She made peace with Sweden; and settled the succession to that crown, as well as to her own dominions, upon the most equitable foundation. Having gloriously finished a war, which had been stirred up against her with Sweden, she replaced the natural order of succession in her own family, by declaring Peter duke of Holstein-Gottorp, who was the son of her elder sister, to be her heir. She gave him the title of grand duke of Russia; and, soon after her accession, she called him to her court; where she renounced the succession to the crown of

Sweden, which undoubtedly belonged to him, embraced the Greek religion, and married a princess of Anhalt-Zerbst. Few princes have had a more uninterrupted career of glory than Elizabeth. She was completely victorious over the Swedes. Her alliance was courted by Great Britain at the expense of a large subsidy; but many political, and some private reasons, it is said, determined her to take part with the house of Austria against the king of Prussia in 1756. Her arms alone could give a turn to the success of the war, which was in disfavor of Prussia, notwithstanding that monarch's amazing abilities both in the field and cabinet. Her conquests were such as portended the entire destruction of the Prussian power, which was perhaps only saved by her critical death on January 5th, 1762.

Elizabeth was succeeded by Peter III., grand prince of Russia and duke of Holstein; a prince whose conduct has been variously represented. He mounted the throne possessed of an enthusiastic admiration of his Prussian majesty's virtues; to whom he gave peace, and whose principles and practices he seems to have adopted as the directories of his future reign. He might have surmounted the effects even of those peculiarities, unpopular as they then were in Russia; but it is said that he aimed at reformations in his dominions which even Peter the Great durst not attempt; and that he even ventured to cut off the beards of his clergy. He was certainly a weak man, who had no opinions of his own, but childishly adopted the sentiments of any person who took the trouble to teach him. His chief amusement was buffoonery; and he would sit for hours looking with pleasure at a merry andrew singing drunken and vulgar songs. He was a stranger to the country, its inhabitants, and their manners; and suffered himself to be persuaded by those about him that the Russians were fools and beasts unworthy of his attention, except to make them, by means of the Prussian discipline, good fighting machines. These sentiments regulated his whole conduct, and prepared the way for that revolution which improprieties of a different kind tended to hasten. Becoming attached to one of the Vorontzoff ladies, sister to the princess Dashkoff, he disgusted his wife, who was then a lovely woman in the prime of life, of great natural talents and great acquired accomplishments; whilst the lady whom he preferred to her was but one degree above an idiot. The princess Dashkoff, who was married to a man whose genius was not superior to that of the emperor, being dame d'honneur and lady of the bedchamber, had of course much of the empress's company. Similarity of situation knit these two illustrious personages in the closest friendship. The princess, being a zealous admirer of the French economists, could make her conversation both amusing and instructive. She retailed all her statistical knowledge; and, finding the empress a willing hearer, she spoke of her in every company as a prodigy of knowledge, judgment, and philanthropy. Whilst the emperor, by his buffoonery and attachment to foreign manners, was daily incurring more and more the odium of his subjects, the popularity of his wife was really increasing; and some persons about

the court expressed their regret that so much knowledge of government, such love of humanity, and such ardent wishes for the prosperity of Russia, should only furnish conversation with Catharine Romanovna, the princess Dashkoff. The empress and her favorite did not let these expressions pass unobserved; they continued their studies in concert; and, whilst the former was employed in her famous code of laws for a great empire, the latter always reported progress, till the middling circles of Moscow and Petersburg began to speak familiarly of the blessings which they might enjoy if these speculations could be realized. Meanwhile Peter III. was giving fresh cause of discontent. He had recalled from Siberia count Munich, who was indeed a sensible, brave, and worthy man; but as he was smarting under the effects of Russian despotism, and had grounds of resentment against most of the great families, he did not much discourage the emperor's unpopular conduct, but only tried to moderate it and give it a system. Peter, however, was impatient. He publicly ridiculed the exercise and evolutions of the Russian troops; and hastily adopting the Prussian discipline, without digesting and fitting it for the constitution of his own forces, he completely ruined himself by disgusting the army. What he lost was gained by the emissaries of Catharine. Four regiments of guards, amounting to 8000 men, were instantly brought over by the three brothers Orloff, who had ingratiated themselves with their officers. The people were in a state of indifference, out of which they were roused by the following means. A little MS. was handed about, containing principles of legislation for Russia, founded on natural rights and on the claims of the different classes of people, which had insensibly been formed, and become so familiar as to appear natural. In that performance was proposed a convention of deputies from all the classes, and from every part of the empire, to converse, but without authority, on the subjects of which it treated, and to inform the senate of the result of their deliberations. It passed for the work of her majesty, and was much admired. While Catharine was thus high in the public esteem and affection, the emperor took the alarm at her popularity, and in a few days came to the resolution of confining her for life, and then of marrying his favorite. The servants of that favorite betrayed her to her sister, who imparted the intelligence to the empress. Catharine saw her danger, and instantly formed her resolution. She must either tamely submit to perpetual imprisonment, and perhaps a cruel and ignominious death, or contrive to hurl her husband from his throne. No other alternative was left her; and the consequence was what undoubtedly was expected. The proper steps were taken; folly fell before abilities and address, and in three days the revolution was accomplished. When the emperor saw that all was lost, he attempted to enter Cronstadt from Oranienbaum, a town on the gulf of Finland, thirty-nine versts, or nearly twenty-six miles from Petersburg. The sentinels at the harbour presented their muskets at the barge; and though they were not loaded, and the men had no cartridges,

he drew back. The English sailors called from ship to ship for some person to head them, declaring that they would take him in and defend him; but he precipitately withdrew. Munich received him again at Oranienbaum, and exhorted him to mount his horse and head his guards, swearing to live and die with him. He said, 'No: I see it cannot be done without shedding much of the blood of my brave Holstenians. I am not worthy of the sacrifice.' The revolution was settled, and Catharine declared autocratrix. The crown was said to be pressed upon her, and her son was proclaimed her heir, and as such great duke of all the Russias. The unfortunate emperor was formally deposed on the 10th of July, 1762, and murdered on the 17th. See CATMARINE II., and PETER III.

Catharine, after accomplishing this revolution, affected to behave with magnanimity and moderation; retained Munich; even pardoned countess Vorontzoff the emperor's favorite; and afterwards, on her marriage with Mr. Paulotsky, made a handsome settlement on them. She allowed the expectations of golden days and a philosophical government to become the subject of fashionable conversation; and the princess Dashkoff was completely happy. The convention of deputies was even resolved on; and as they were not to be elected by the people, except here and there for show, prince Galitzin and count Panin, whom she had completely gained over, and who had the greatest abilities of any Russians about court, were at immense pains in appointing a proper set. In the mean time a great number of showy patriotic projects were begun. An English clergyman was invited over to superintend the institution of schools for civil and moral education; and the empress was most liberal in her appointments. This institution failed, however, to produce the effects expected from it. The clergyman appointed, though a most excellent character and real philanthropist, had views too contracted for the sphere in which he was placed; and Mr. Betskoy, the Russian Mecænas, to whom the empress referred him for instructions, preferred declamation, and stage-playing, and ballets, to all other accomplishments. In the mean time, elegance of all kinds was introduced, before the people were taught the principles of morals. The nobles were sent to travel; and, as the Russians more easily acquire foreign languages than the people of most other nations, have great vivacity without flippancy, and in general understand play, these travellers were every where well received, especially at Paris, where reasons of state contributed not a little to procure them that attention with which they were treated. They were ravished with the manners of foreign courts, and imported fashions and fineries without bounds. The sovereign turned all this to her own account, by encouraging a dissipation which rendered court favors necessary, and made the people about her forget their Utopian dreams. The convention of deputies at last assembled in the capital. The empress's book of instructions came forth; and great things were doubtless expected. It was entitled *Instructions for the Deputies to consult about*

New Code of Laws, &c., and is a very respectable work, which does honor to the empress, by whom it was undoubtedly composed, if she had seriously intended to put it in execution. But the most consequential of the deputies were privately instructed to be very cautious, and informed that carriages and guards were ready for Siberia. There was a grand procession at their presentation. Each had the honor of kissing her majesty's hand and receiving a gold medal. They met in form to recognise one another, then parted, and have never met since. The New Code melted away without notice; and the princess Dashkoff was handsomely given to understand that her counsels were no longer necessary, and that she could not do better than take the amusement of the tour of Europe. She was liberally supplied, visited London, Edinburgh, and most other capitals in Europe; accompanied by one of the young princes, said to have been Paul, afterwards emperor; and was treated with great kindness, but kept amused with something very different from legislation. In the mean time, many patriotic things were really done. Taxes were frequently remitted where they were burdensome. Every person was declared free who had served government without pay for two years. No man was allowed to send boors from his cultivated estates to his mines in Siberia, nor to any distant estates, but for the purposes of agriculture. Many colonies of German peasants were in various places settled on the crown-lands, to teach the natives the management of the dairy: a branch of rural economy of which the Russians were till that period so completely ignorant that there is not in their language an appropriated word for butter, or cheese, or even for cream. The Russians hoped to be likewise instructed in agriculture; but the colonists were poor and ignorant; and this part of the project came to nothing, like the great national schools. Other improvements, however, took place in favor of commerce; for all barriers were removed, and goods suffered to pass through the empire duty-free. The empress with great liberality encouraged the introduction of arts and manufactures. An academy was instituted of sculpture, painting, architecture, &c., a magnificent and elegant building was erected for it, and many *élèves* supported in it at the expense of the crown. Several very promising youths have been educated in that academy; but as the Russians are childishly fond of finery, and cannot be persuaded that any thing fine was ever done by their own countrymen, the students are all, on leaving the academy, suffered to starve. The empress, who had a very just taste in architecture, designed several buildings equally useful and ornamental to her capital (see NEVA and PETERSBURG); and, while she thus diligently cultivated the arts of peace, she did not neglect those of war. She put her fleets on the most respectable footing, and procured a number of British officers to instruct her seamen in the science of naval tactics. By land, her successes against the Turks, the Swedes, and the Poles (see POLAND, SWEDEN, and TURKEY), compel us to believe that her troops were better disciplined, and her generals more skilful, than

any whom the greatest of her predecessors could bring into the field; and the empire of Russia, though the people are but just emerging from a state of barbarism, is at this day one of the most powerful in Europe. But the glory of Catharine's reign is stained by injustice and cruelty. More horrible massacres than those of Ismail and Prague, by her general Suwarrow, were not committed by the most savage troops in the most barbarous ages. Of her character, both public and private, we have given a general sketch under the article CATHARINE II. About fifteen different princes and courtiers successively gratified her desires. Among these were Alexis and Gregory Orloffs, brothers; prince Potemkin; prince Lauskoi; the two Zubows, brothers; Vassilchikoff, a lieutenant of the guards; count Panin; and several others. The first of her lovers was Stanislaus Augustus, count Poniatowski, with whom she had formed a connexion even in her husband's lifetime; and whom she afterwards rewarded with the kingdom of Poland, for it was by her influence, and the presence of her troops, that the election was over-awed in his favor, on the 7th of September 1764; though she afterwards deprived him of his crown and dominions, when she found him no longer pliable, but willing to give the Poles a free constitution. While she was thus disposing of foreign kingdoms, she was under continual dread of being thrown, by some sudden plot or revolution, from the throne she had usurped. To prevent this, she hesitated at no new crimes. She procured the private assassination of prince John, whom her husband Peter III. had generously liberated from prison. She also, by the most treacherous means, wherein prince Alexis Orloff was her villainous agent, shut up the princess Tarrakanoff, a daughter of the empress Elizabeth, by Alexis Razumoffsky (who had been privately married to her), in a fortress, where she was never more heard of. Such were the means she used to get rid of all who had any claim to the throne. Yet, with all her crimes and vices, it must be allowed that she did more to civilize her barbarous subjects than even Peter the Great. In Petersburg alone she founded thirty-one seminaries, wherein 6800 children of both sexes were educated at the annual expense of 754,333 rubles. She superintended the education of her own grandchildren, and even wrote books for their instruction; while jealousy led her to keep their father, her own son Paul, at a distance from court and from all opportunity of improvement. But her greatest effort for the improvement of science was in 1767, when she employed the celebrated Drs. Pallas, Gmelin, Euler, and several other men very eminent in the republic of letters, to travel through her vast dominions, to determine the geography of her extensive territories, the position of the chief towns, their temperature, soil, and productions; and the manners of the inhabitants, &c. This survey of her empire must immortalise her name in science, when her crimes are forgotten. In the coalition against the French republic Catharine promised much, but did nothing, except granting refuge to French emigrants, and sending a squadron of crazy ships to co-operate with the British navy, which were

obliged to be repaired at the expense of the British government. This extraordinary woman was meditating a new war with the Turks, when she was suddenly seized on the morning of November 9th, 1796, with a fit of apoplexy, which put an end to her life at 10 o'clock in the evening of the 10th, in the sixty-eighth year of her age. And she certainly died with the character of one of the greatest sovereigns that ever swayed the sceptre in Russia.

Catharine II. was succeeded in the empire of all the Russias by her son Paul, whose reign was short, and his end, like that of his father, unfortunate. Paul, though his education, from his mother's jealousy, had been very much neglected, seemed not to want spirit for great exertions. He took an active and zealous part with the combined powers in the operations against the French republicans; and, by the exertions of his troops under Suwarrow, the French power in Italy was for some time totally overthrown. They also made some exertions in Holland to assist the British troops, but with less success. But all Suwarrow's exertions were unrewarded by Paul; who, adopting a new system of politics, and showing an evident inclination to favor the French republicans, disgraced instead of recompensing the old general. But, while Paul was meditating farther exertions in favor of his new allies, the French republicans, he was murdered on the 23d March, 1801. The particulars of this transaction have been so variously related that we forbear to state any of them. The causes of the murder have been also so variously assigned that we shall likewise leave the investigation of them to future historians. But it is per-

haps an instructive exhibition of the nature of all arbitrary governments that, where the lives of the subjects are all at the mercy of the sovereign, the life of the sovereign should be at all times at the mercy of assassins. Of the character of Paul we shall only say that he appears to have been a well meaning man, but too fond of that arbitrary power to which he thought himself entitled by his birth, and of consequence rash and precipitate in his measures. See PAUL.

Paul was succeeded by his eldest son, Alexander; who, whether he was previously acquainted with the plot or not, appears to have made little enquiry after his father's murderers. For some time after his accession to the throne he appears to have profited considerably by his grandmother's instructions, and those of the preceptors she placed over him. He encouraged learning, the sciences, commerce, and manufactures, for the benefit of his subjects and empire. After several energetic but unsuccessful struggles against France, he became the humble friend of Buonaparte, and was afterwards for a while the most illustrious of his dupes and victims. See his life in detail in our article ALEXANDER OF RUSSIA. That article also brings down the history of this empire to a very recent period. We need only add that, through the intrigues of the empress mother, Constantine the elder brother was afterwards set aside, or compelled to abdicate the throne in favor of the reigning emperor Nicholas: he has principally distinguished himself by a still equivocal attack on Turkey (1828); in which, however, he has succeeded in the capture of the important fortress of Varna.

RUST, *n. s., v. n., & v. a.* Sax. *rust*; Dan. *Rust*, *adj.* } *rust*; Sard. *rost*.
The red oxide of iron: to gather rust or make rusty; the adjective corresponding.

Must I *rust* in Egypt never more
Appear in arms, and be the chief of Greece? *Id.*
Part scour the *rusty* shields with seam, and part
New grind the blunted axe. *Id. Aeneis.*
My scymitar got some *rust* by the sea water.
Gulliver.

This iron began at the length to gather *rust*.
Hooker.
Her fallow leas,
The darnel, hemlock, and rank fumitory
Doth root upon, while that the culter *rusts*,
That should deracinate such savagery. *Shakspeare.*
Keep up your bright swords, for the dew will *rust*
them. *Id. Othello.*
Hector, in his dull and long continued truce,
Is *rusty* grown. *Id. Troilus and Cressida.*
Let 'her see thy sacred truths cleared from all *rust*
and dross of human mixtures. *King Charles.*
Rust eaten pikes and swords in time to come,
When crooked ploughs dig up earth's fertile womb,
The husbandman shall oft discover. *May's Virgil.*
Gold is the best metal; and, for purity, not sub-
ject to *rust* as all others: and yet the best gold has
some dross. *Bp. Hall.*
After a long calm of peace, he was left engaged
in a war with a *rusty* sword and empty purse.
Howel.

RUST is the oxide of any metal, procured by corroding and dissolving its superficial parts by some menstruum. Water is the great agent in producing rust; and hence oils and other fatty bodies secure metals from rust; water being no menstruum for oil, and therefore not able to make its way through it. All metals except gold are liable to rust; and even this also if exposed to the fumes of sea-salt. Iron, for instance, when exposed to the air, soon becomes tarnished, and gradually changed into a brownish-red or yellow powder, well known by the name of rust. This change is occasioned by the gradual combination of the iron with the oxygen of the atmosphere, and is therefore an oxide of iron. The cutlers in Sheffield, when they have given knife or razor blades the requisite degree of polish, rub them with powdered quicklime, in order to prevent them from tarnishing; and we have been informed that articles made of polished steel are dipped in lime-water by the manufacturer, before they are sent into the retail market. Another method is that of varnishing over the metal with a composition of two parts oil varnish, mixed with one part rectified

But Pallas came in shape of *rust*,
And 'twixt the spring and hammer thrust
Her Gorgon shield, which made the cock
Stand stiff, as 'twere transformed to stock.
Hudibras.
By dint of sword his crown he shall increase,
And scour his armour from the *rust* of peace.
Dryden.

spirits of turpentine. This varnish must be lightly and evenly applied with a sponge; after which the article is to be left to dry in some situation not exposed to dust. Articles thus varnished retain their metallic lustre, and do not contract any spots of rust. This varnish may be employed with particular advantage to preserve philosophical instruments from any change, in experiments where, by being placed in contact with water, they are liable to lose that polish and precision of form, which constitute part of their value. Plumbago, or black lead, also protects iron from rust for a time, and is on that account used on the fronts of grates, &c.

RUSTIC, <i>adj. & n. s.</i>	} Lat. <i>rusticus</i> .
RUSTICAL,	
RUSTICALLY,	
RUSTICALNESS,	
RUSTICATE, <i>v. n. & v. a.</i>	
RUSTIC'RY.	} man: the adverb

and noun-substantive corresponding: to rusticate is to reside in or banish into the country.

By Julius willing missing was the odds of the Iberian side, and continued so in the next by the excellent running of a knight, though fostered by the muses, as many times the very *rustick* people left both their delights and profits to hearken to his songs.

Sidney.

There presented himself a tall, clownish, young man, who, falling before the queen of the fairies, desired that he might have the achievement of any adventure, which, during the feast, might happen; that being granted, he rested him on the floor, unfit for a better place by his *rusticity*.

Spenser.

My brother Jaques he keeps at school,
And report speaks goldenly of his profit;
For my part he keeps me *rustically* at home.

Shakespeare.

An altar stood, *rustick*, of grassy ford.

Milton.

This is by a *rustical* severity to banish all urbanity, whose harmless and confined condition is consistent with religion.

Browne's Vulgar Errors.

He confounds the singing and dancing of the satyrs with the *rustical* entertainment of the first Romans.

Dryden.

Quintius here was born,

Whose shining ploughshare was in furrows worn,
Met by his trembling wife, returning home,

And *rusticuly* joyed, as chief of Rome.

Id.

I was deeply in love with a milliner, upon which I was sent away, or, in the university phrase, *rusticated* for ever.

Spectator.

The sweetness and *rusticity* of a pastoral cannot be so well exprest in any other tongue as in the Greek, when rightly mixed with the Dorick dialect.

Addison.

As nothing is so rude and insolent as a wealthy *rustick*, all this his kindness is overlooked, and his person most unworthily railed at.

South.

This so general expense of their time would curtail the ordinary means of knowledge, as 'twould shorten the opportunities of vice; and so accordingly an universal *rusticity* presently took place, and stopped not till it had over-run the whole stock of mankind.

Woodward's Natural History.

With unguent smooth the polished marble shone,
Where ancient Neleus sat, a *rustick* throne.

Pope.

My lady Scudamore, from having *rusticated* in your company too long, pretends to open her eyes for the sake of seeing the sun, and to sleep because it is night.

Id.

An ignorant clown cannot learn fine language or

a courtly behaviour, when his *rustick* airs have grown up with him till the age of forty.

Watts's Logick.

RUSTIC GODS, *dii rustici*, in antiquity, the gods of the country, or those who presided over agriculture, &c. Varro invokes the twelve di. consentes, as the principal among the rustic gods, viz. Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympha, and Fortune. Besides these twelve arch-rustic gods, there were a number of lesser ones; as Pales, Vertumnus, Tutelina, Fulgor, Sterculius, Mellona, Jugatinus, Collinus, Vallonia, Terminus, Sylvanus, and Priapus. Struvius adds the Satyrs, Fauns, Sileni, Nymphs, and even Trytons; and gives the empire over all the rustic gods to Pan.

RUSTIC WORK, is where the stones in the face, &c., of a building, instead of being smooth, are latched, or picked with the point of a hammer.

RUSTICUS (L. Junius Arulenus), a learned Roman, the preceptor and friend of Pliny the younger. His abilities are celebrated by Pliny and Tacitus. He was put to death by Domitian.

—Sueton.

RUSTLE, *v. n.* Sax. *pnrytlan*. To make a low continued small noise or rattle.

He is coming; I hear the straw *rustle*.

Shakespeare.

This life

Is nobler than attending for a check;
Richer than doing nothing for a bauble;
Prouder than *rustling* in unpaid-for silk.

Id.

Thick swarmed, both on the ground, and in the air

Brushed with the hiss of *rustling* wings.

Milton.

As when we see the winged winds engage,
Rustling from every quarter of the sky,
North, East, and West, in airy swiftness vy.

Granville.

All begin the attack;

Fans clap, silks *rustle*, and tough whalebones crack.

Pope.

Not less their number than the milk-white swans
That o'er the winding of Cyaster's springs,
Stretch their long necks, and clap their *rustling* wings.

Id.

RUSTSCHUK, or RUSCEK, a large town or European Turkey, in Bulgaria, situated at the influx of the Cara Lom into the Danube, which is here nearly two miles wide. It has a strong castle and several mosques and public baths; is the see of a Greek archbishop, and contains considerable manufactures of silk, cotton, linen, woollen, and tobacco. Giorgley and this town are the two great entrepôts for the commercial intercourse by the Danube between the Euxine and the interior. It was taken by the Russians in 1810, and the following year a Turkish army was totally defeated near this by the Russians, with the loss of all its artillery and baggage. About five miles from Rustschuk are to be seen the ruins of the old town of Tschernow or Csernavoda. Population 24,000. Forty miles east of Nicopoli, and fifty-five west of Semendria.

RUT, *n. s.* Fr. *rut*. Copulation of deer: also, from the Fr. *route*, the track of a cart-wheel.

That is an advertisement to one Diana, to take heed of the allurements of count Rousillon, a foolish idle boy; but for all that very *rustish*.

Shakespeare. All's Well that Ends Well.

The time of going to *rut* of deer is in September ; for that they need the whole summers feed to make them fit for generation ; and, if rain come about the middle of September, they go to *rut* somewhat the sooner. *Bacon.*

From hills raine waters headlong fall,
That always eat huge *ruts*, which, met in one bed
fill a vall

With such a confluence of streames, that on the
mountaine grounds

Farre off, in frighted shepherds eares the bustling
noise rebounds. *Chapman.*

The ground hereof was the observation of this part
in deer after immoderate venery, and about the end
of their *rut*. *Browne.*

RUTA, in botany, rue ; a genus of the monogynia order, and decandria class of plants ; natural order twenty-sixth, multisiliquæ : *CAL.* quinquepartite ; petals concave ; receptacle surrounded with ten melliferous pores : *CAPS.* lobed : *SEEDS* numerous. There are several species, of which the most remarkable are these :—

1. *R. бага*, or Swedish turnip. See **RURAL ECONOMY**. Besides being later in shooting than the common turnip, this plant loses not its nutritive qualities after being shot, but retains all its juices and solidity. This root has been supposed a mere variety of the yellow turnip, but it is found to differ very materially. The stem has something of the appearance of the rape, or cabbage kind ; and that part of the root which is above the surface of the ground is covered by a thick, green skin, which in some is smooth, but in others quite rough, and the internal fleshy part is of a dense firm consistence, having a yellowish tinge, nearly similar to that of the horn carrot. The great inducements for the farmer to enter freely into the culture of this root are, according to Mr. Young, 1. If he has the right sort of seed, the root yellow in flesh, and rough in coat, it lasts through all frosts, and may be depended on for sheep quite through the month of April, though drawn two months before, and spread on a grass field. 2. It is an excellent and nourishing food for sheep, and also for any sort of cattle. 3. It is equal to potatoes in keeping stock swine : a point of very great consequence. 4. It is, next to carrots, the very best food that can be given to horses. 5. It is sown at a season which leaves ample time, in case of a failure, to put in common turnips, or cabbages. Another extraordinary quality of the *ruta бага* is that it seems impossible to make it rot : though bit, or trod upon by cattle or horses, it never rots ; but whatever part of the root is left, nay, if scooped out to the shell, it remains perfectly fresh, and in spring puts out a new stem. Both roots and leaves are excellent for culinary purposes.

2. *R. hortensis*, or common broad-leaved garden rue, has been long cultivated for medicinal use. It rises with a shrubby stalk to the height of five or six feet, sending out branches on every side, garnished with leaves, whose small lobes are wedge-shaped, of a gray color, and have a strong odor. The flowers are produced at the end of the branches in bunches almost in the form of umbels : they are composed of four yellow concave petals, which are cut on their edges, and eight yellow stamina which are longer

than the petals, terminated by roundish summits. The germen becomes a roundish capsule, with four lobes, full of holes containing rough black seeds. Rue has a strong unpleasant smell, and a bitterish penetrating taste : the leaves, when full of vigor, are extremely acrid, insomuch as to inflame and blister the skin, if much handled. With regard to their medicinal virtues, they are powerfully stimulating, attenuating, and detergent. Boerhaave entertained a very high opinion of the virtues of this plant, particularly of the essential oil, and the distilled water cohobated or redistilled several times from fresh parcels of the herb

RUTCHESTER, an ancient town of Northumberland, north-west of Chollerton, called Vindobala by the Romans. The wall of Severus runs on the middle of the east rampart, and that of Adrian passes about a chain to the south of it. Its fort was formerly considerable, and its ruins are still remarkable.

RUTH, *n. s.*

RUTHFUL, *adj.*

RUTHFULLY, *adv.*

RUTHLESS, *adj.*

From rue. Mercy ;

pity ; tenderness : the de-

rivatives all correspond-

ing. Out of use.

His archers circle me ; my reins they wound,
And *ruthless* shed my gall upon the ground.

Sandys.

The Britons, by Maximilian laid way
With wretched miseries and woful *ruth*,
Were to those Pagans made an open prey. *Spenser.*

Help me, ye baneful birds, whose shrieking sound
Is sign of dreary death, my deadly cries
Most *ruthfully* to tune. *Id. Pastorals.*

The flower of horse and foot, lost by the valour of
the enemy, *ruthfully* perished. *Knolles.*

What is Edward but a *ruthless* sea ?

What Clarence but a quicksand of deceit ?

Shakspeare.

All *ruth*, compassion, mercy be forgot. *Fairfax.*

By this Minerva's friend bereft

Oileades of that rich bowl, and left his lips, nose,
eyes

Ruthfully smeared.

Chapman's Iliad.

O wretch of guests, said he, thy tale hath stirred
My mind to much *ruth*. *Chapman.*

The inhabitants seldom take a *ruthful* and reaving
experience of those harms, which infectious dis-
eases carry with them. *Carew.*

The better part with Mary and with Ruth

Chosen thou hast ; and they that overween,

And at thy growing virtues fret their spleen,

No anger find in thee, but pity and *ruth*. *Milton.*

Their age the hostile powers restrain,

All but the *ruthless* monarch of the main. *Pope.*

RUTH, a canonical book of the Old Testament, being a kind of appendix to the book of Judges, and an introduction to Samuel ; and having its title from the person whose history is herein principally related. In this history are observable the ancient rights of kindred and redemption, and the manner of buying the inheritance of the deceased. The authenticity of this book was never disputed ; but the learned are not agreed about the epocha of the history it relates. Watkins places it about A. A. C. 1254.

RUTHERFORD (John), M. D., one of the founders of the medical school in the University of Edinburgh, was born in 1695, and received the rudiments of his education at the parish school of Selkirk. After his father's death he

went to Edinburgh, where he studied at the University. He next engaged himself as an apprentice to a surgeon in Edinburgh, with whom he continued till 1713, when he went to London, and attended the lectures on anatomy by Dr. Douglas, on surgery by Andre, and on *materna medica* by Strotter. In 1717 he returned to Edinburgh, and afterwards he went to Leyden, then the most famous medical school in Europe. In 1719 he went to France, and was, in July, admitted to the degree of M. D. at the University of Rheims. He spent the winter in Paris, for the sake of Winslow's demonstrations in anatomy; and in 1720 returned to Britain. In 1721 he settled as a physician in Edinburgh; and soon afterwards joined with Drs. Sinclair, Plummer, and Junes, in purchasing a laboratory, for the preparation of compound medicines. They also gave lectures on chemistry to a numerous audience; and soon after on other branches of medicine. In 1725 they were appointed conjoint professors in the University, and each for some time read lectures in every department of medical science, except anatomy, and carried forward their classes in rotation. In 1748 Dr. Rutherford introduced a great improvement in medical education. Sensible that abstract lectures on the symptoms and the mode of treating various diseases, of which the students know little but the names, could scarcely be of any benefit, he had for some time encouraged his pupils to bring patients to him on Saturday, when he enquired into the nature of their diseases, and prescribed for them in the presence of the class. This gave rise to the course of clinical lectures; the utility of which was so obvious that it was enacted, by a decree of the senate of the University, that no man should be admitted to an examination for his degree who had not attended those lectures; to which an excellent hospital, then newly erected, gave the professors every opportunity of doing ample justice. He resigned his professorship in 1765, after having taught medicine in its different departments for upwards of forty years. He died in Edinburgh in 1779.

RUTHERFORD (Thomas), D.D., was born in 1712; became fellow of St. John's College, Cambridge, regius professor of divinity in that university, rector of Shenfield, and archdeacon of Essex. He married Charlotte Elizabeth Abdy, daughter of Sir William Abdy, Bart. He published, 1. *An Essay on the Nature and Obligations of Virtue*; 8vo. 1744. 2. *A System of Natural Philosophy*; Cambridge, 1743; 2 vols. 8vo. 3. *A Letter to Dr. Middleton, in defence of Bishop Sherlock*; 8vo. 1750. 4. *A Discourse on Miracles*; 8vo. 1751. 5. *Institutes of Natural Law*; 2 vols. 8vo. 6, 7. *Two Letters to Dr. Kennicott*; 1761 and 1762. 8. *A Vindication of Subscriptions to an Established Confession of Faith*. &c.; Cambridge, 1767. 9, 10. *Two other Tracts on the same subject*; 1766 and 1767: besides several Sermons, and Charges to the Clergy. He died October 5th, 1771, aged fifty-nine.

RUTHERGLEN, or RUTLEN, an ancient royal borough of Scotland, in Lanarkshire. Maitland says it was founded by Ruth, the

seventh king of Scots, from whom it derived its name. From several original charters, still preserved, it is certain that it was erected into a royal borough by king David I. about 1126. The territory under the jurisdiction of the borough was extensive, and the inhabitants enjoyed many distinguished privileges, which were however gradually wrested from them in favor of Glasgow, which in later times rose into consequence by trade and manufactures. It is now much reduced, consisting of but one street and a few lanes. About 150 yards to the south of the main street is a kind of lane, named *Dins Dykes*, where queen Mary was for a short time stopt in her flight, after the battle of Langside, by some insolent rustics. Adjoining to a lane called the *Back Row* stood the castle of Rutherglen, originally built about the time of the foundation of the town. This ancient fortress underwent several sieges during the wars in the days of king Robert Bruce, and it remained a place of strength until the battle of Langside; soon after which it was destroyed by the regent, to revenge himself on the Hamilton family, in whose custody it then was. No relic of it now exists. Rutherglen joins with Glasgow, Renfrew, and Dumbarton, in electing a member to the British parliament. Rutherglen is two miles south-east of Glasgow, and nine west of Hamilton.

RUTHVIN, a town of North Wales, in Denbighshire, with a good market on Monday, with an ancient castle seated in a valley on the *Clyd*, now in ruins. The church, a handsome building, was made collegiate in 1310, at which time there was here a monastery of White Friars. The town was formerly surrounded by walls, but it is now little more than a broad ill-built street, leading to the market-house, near which stands the town-hall. It has a free school and a large hospital; fifteen miles south-west of Holywell, and 210 north-west of London.

RUTILIUS RUTUS (Publius), a Roman consul, in the age of Sylla, celebrated for his writings. Sylla having banished him, he retired to Smyrna, and refused, when solicited by his friends, to be restored by arms. He was the first who taught the Roman soldiers to fabricate their own weapons; and, during his exile, wrote a *History of Rome*, in Greek; an account of his own life in Latin; and many other works, which are lost. Ovid, Fast., Seneca, Cic. &c.

RUTLAND, county of, or RUTLANDSHIRE, is the smallest county of England. The Saxon name of this county was *Roteland*, but its etymology is otherwise unknown. Some have derived it from *Roet*, or *Rud*, which signifies red, because in many parts of the county the land is of a red color. But others object that this cannot be the reason, and allege that there is only one part of the county, which is about *Glaiston*, that has a ruddy soil; besides, most of the English counties have soils of the same color; and therefore the word would have it to be derived from the word *Rotundalandia*, from its circular figure; but its form was not round when this name, of which Rutland is supposed to be a contraction, was given it; and, besides, it is not probable that the Saxons would give a Latin name to an English county. The *Coritani* inhabited this

district in the time of the Romans; but under the Saxons it was part of the kingdom of Mercia. This county is bounded by Leicestershire on the N.N.W., west and south-west; and by Lincolnshire on the east and north-east. It is only forty-eight miles in circumference. It is divided into five hundreds, and contains 91,002 acres and twenty-nine perches.

The climate of this county is generally esteemed very good and healthy; and it is thought that the winds blow as many days in the year from one point as another, the west excepted. The mean quantity of rain which has been observed, according to a journal kept by Samuel Barker, esq., and cited in Mr. Parkinson's Survey, in eight years, was 24·61. The soil of this county is, generally speaking, fertile, but varying very much in different parts; the east and south-east parts, through which the great North road runs, being in general of a shallow staple, upon limestone rock, with a mixture of cold woodland clay soil. The other parts of the county are composed of a strong loamy red land, intermixed with keal (iron-stone is found amongst it). This soil is esteemed most congenial for convertible tillage crops; the understratum of the whole county, at different depths, is generally a very strong blue clay. The circumstance of this county varying so much in its soils, at such small distances, causes each sort to be much more valuable than it would be were it of one kind through the whole of a lordship; there being a proportion of each soil on the different farms, so as to have convertible high lands for tillage, and low lands for grass, having the advantage of being proper for breeding and store stock; thus producing every thing useful within themselves, the tillage land growing turnips for the store and fattening sheep; barley, clover, wheat, and grass-seeds plentifully. The face of the county is, generally speaking, very beautiful, especially where it is well timbered, being much diversified by small and gently rising hills running east and west, with valleys of about half a mile in width intervening; so that in travelling through the county there are fresh views at the distance of every three or four miles, causing its appearance to be very lively. The produce of this county has already been partially alluded to: its barley is of a very superior quality, so that the inhabitants call it corn, giving other grain its name, such as wheat, oats, &c. At Ketton there is a kind of stone very proper and famous for building. There is also in many parts stone for lime, consisting of a soft and hard species. Various opinions are entertained of the lime made from these two sorts; but in general that from the hard stone is preferred. This county is, upon the whole, well watered. The rivers Eye and Welland are its south-west and south-east boundaries; but its two principal rivers are the Guash and the Chater: there are also many rivulets and numberless springs. The Welland divides this county from Northamptonshire; the Guash, or, as it is commonly called, the Wash, rises near Oakham, in a district surrounded with hills, and running eastward divides the county nearly into two equal parts, and running into

Lincolnshire falls into the Welland to the east of Stamford. This river supplies many towns with excellent water, and affords plenty of fish; and most of the other towns and villages at a distance from this river have rivulets and brooks that pass by them.—There is a navigable canal in this county, made by act of parliament passed in 1793, for extending the Melton Mowbray canal to Oakham, the centre of the county, which has proved of great benefit to it. It is said, however, to be frequently defective in the summer season from the very scanty supply of water. Rutlandshire sends only two members to parliament, both for the county.

The smallness of this county will account for the few eminent men it has produced. We know not whether we may apply the term eminent to Jeffery Hudson, the dwarf; but certainly he thought himself of some consequence when he fought a duel with a brother of lord Croft's. He was born at Oakham, the county town, in the year 1619, and when seven years of age was not above fifteen inches high, though his parents, who had several other children of the usual size, were tall and lusty. At that age the duke of Buckingham took him into his family; and, to divert the court, who, on a progress through this county, were entertained at the duke's seat at Burleigh-on-the-Hill, he was served up at table in a cold pie. Between the seventh and the thirteenth year of his age he did not advance many inches in stature; but it is remarkable that even after thirty he shot up to the height of three feet nine inches, which he never exceeded. He was given to Henrietta Maria, consort to king Charles I., probably at the time of his being served up in the pie; and that princess, who kept him as her dwarf, is said frequently to have employed him in messages abroad. In the civil wars between king Charles the First and the Parliament, Hudson was raised to the rank of captain of horse in the king's service, and afterwards accompanied the queen, his mistress, to France; whence he was banished for killing his antagonist, as above mentioned. They fought on horseback. After his banishment, he was taken at sea by an Algerine corsair, and was many years a slave in Barbary; but being redeemed he came to England, and in 1678 was committed prisoner to the Gate House, Westminster, on suspicion of being concerned in what was called Oates's plot. After lying there a considerable time he was discharged, and died in 1682, aged sixty-three years. In Newgate Street, London, there is a small stone sculpture of one William Evans, a gigantic porter to Charles I.; and another of his diminutive fellow-servant. Pennant has given us a sketch of this sculpture on the same plate with the Boar in East Cheap, but has omitted to insert the date, 1669. The same author observes that it was probably by his own consent that the dwarf was put into the pocket of the giant, and drawn out by him at a masque at court to amaze and divert the spectators; for it is certain he had too much spirit to suffer such an insult from even Goliath, as was evident from his courage in 1644, when he killed Mr. Croft, who had presumed to ridicule the irritable hero. These figures are in

very excellent preservation, having been recently painted, with red surtouts, by the owner or occupier of the house (No. 80), Mr. George Payne, hatter, hosier, and glover. Mr. Pennant, and others after him, have placed this sculpture over the entrance to Bagnio Court.—This county has given the title of earl ever since the reign of Richard II. The first earl of Rutland was Edward, the eldest son of Edward Langley, the fifth son of Edward III.: but the first earl of the present family of Manners was created earl of Rutland by Henry VIII. In the reign of queen Anne, John Manners, then earl of Rutland, received from that princess the title of marquis of Granby and duke of Rutland, which his successors still enjoy.

‘There is no manufacture carried on in this county of any account. Want of water and scarcity of fuel are the only reasons, and not any want of inclination, spirit, or property, in the inhabitants of the county.’ Parkinson.

RUTTUNPORE, a town and district of Hindostan, in the province of Gundwaneh. It is governed by a rajah, who is tributary to the Mahrattas. The town consists of about 1000 houses, but it was formerly a place of much greater consequence. There are other places of this name in Hindostan.

RUTUBA, in ancient geography, two rivers of Italy: one in Liguria, rising in the Appenine mountains, and running into the Mediterranean: another in Latium, falling into the Tiber.

RUTULI, an ancient people of Latium, over whom Turnus reigned, when Æneas arrived in Italy. Their capital was Ardea.

RUTUPÆ, RUTUPIUM, or RUTUPENSIS PORTUS, in ancient British geography, a sea-port town of Cantium, on the south coast of Britain, abounding in oysters. Some suppose it to be Dover; others Richborough, or Sandwich.

RUYSCH (Frederick), the celebrated Dutch anatomist, was born at the Hague in 1638. After making great progress at home, he repaired to Leyden, and there prosecuted the study of anatomy and botany. He studied next at Franeker, where he became M. D. He then returned to the Hague; and, marrying in 1661, devoted his whole time to his profession. In 1665 he published a treatise, entitled *Dilucidatio valvularum de Vasis Lymphaticis et Lacteis*; which raised his reputation so high that he was chosen professor of anatomy at Amsterdam. After this he was perpetually engaged in dissecting the various parts of the human body. His anatomical collection was very valuable. He had a series of fetuses of all sizes, from the length of the little finger to that of a new born infant. Peter the Great of Russia, in his tour through Holland in 1698, visited Ruysch, passed whole days with him, and, when he returned to Holland in 1717, purchased his cabinet of curiosities for 30,000 florins, and sent it to Petersburg. In 1685 he was made professor of medicine. Ruysch retained his vigor of mind and body till 1731, when he died on the 22d of February. His anatomical works are printed in 4 vols. 4to. The style of his writings is simple and concise, but sometimes inaccurate. The academy of

sciences at Paris in 1727 elected him a member. He was also F.R.S. of London.

RUYSDAAL, or RUYSDALE (Jacob), an eminent Dutch landscape painter, born at Haarlem, in 1636. He painted sea pieces with inimitable truth and transparency. He died in 1681.

RUUYTER (Michael Adrian), a distinguished Dutch naval officer born at Flushing, in Zealand, in 1607. He entered on a seafaring life when he was only eleven years old, was first a cabin boy, and advanced successively to the rank of mate, master, and captain. He made eight voyages to the West Indies, and ten to Brasil. He was then promoted to the rank of rear admiral, and sent to assist the Portuguese against the Spaniards. His gallantry was still more conspicuous before Sallee in Barbary. With one single vessel he sailed through the roads of that place in defiance of five Algerine corsairs. In 1653 a squadron of seventy vessels was sent against the English under admiral Van Tromp. Ruyter, who accompanied the admiral in this expedition, seconded him with great skill and bravery in the three battles which the English so gloriously won. He was afterwards stationed in the Mediterranean, where he took several Turkish vessels. In 1659 he received a commission to join the king of Denmark in his war with the Swedes; and the king of Denmark ennobled him and gave him a pension. In 1661 he run ashore a vessel belonging to Tunis, released forty Christian slaves, made a treaty with the Tunisians, and reduced the Algerine corsairs to submission. His country raised him to the rank of vice-admiral and commander in chief. He obtained a signal victory over the combined fleets of France and Spain in 1672, about the time of the conquest of Holland. Ruyter, having thus made himself master of the sea, conducted a fleet of Indiamen safely into the Texel; thus defending and enriching his country, while it was the prey of hostile invaders. In 1673 he had three engagements with the fleets of France and England, in which his bravery was more distinguished than ever. But in an engagement with the French fleet, off the coast of Sicily, he lost the day, and received a mortal wound, of which he died in a few days. His corpse was carried to Amsterdam, and a magnificent monument was there erected by the command of the states-general.

RYDAL WATER, a lake of Westmoreland, a little west of Ambleside; about one mile long. It has many small islands; and communicates by a narrow channel with Grassmere Water on the west, and by the Rothway with Windermere Lake on the south. Rydal Hall stands on an eminence near the lake.

RYDROOG, a town and district of Hindostan, in the province of Bijanagur, now included in the British collectorship of Bellary. It was taken possession of in the end of the sixteenth century, by the delawai, or minister of the rajah of Bijanagur, after the defeat of that prince by the Mahometans. In 1766 it was subdued by Hyder Aly; and at the peace of 1792 ceded to the Nizam; but in the year 1800 it was

made over to the British. The town stands in long. 77° 22' E., and lat. 14° 19'.

RYE, *n. s.* Sax. *ryge*; Swed. *ryg*, *rog*; Belg. *rogge*, *i. e.* rough. A coarse kind of bread corn.

Between the acres of the *rye*,
These pretty country folks would lye. *Shakspeare*
Some sow *rye* grass with the corn at Michaelmas
Mortimer.

Rye is more acid, laxative, and less nourishing than wheat. *Arbutnot on Aliments.*

RYE, in botany. See SECALE.

RYE, a town of Sussex, with markets on Wednesday and Saturday. It is one of the cinqueports; is a handsome well built place, governed by a mayor and jurats, and sends two members to parliament. It has a church built with stone, and a town hall; and the streets are paved with stone. It has two gates, and is a place of great naval trade. Thence large quantities of corn are exported, and many of the inhabitants are fishermen. It is thirty-four miles south-east by south of Tunbridge, and sixty-four on the same point from London. The mouth of the harbour is choked up with sand, though of late it has been considerably improved, by cutting a new channel to the sea, and erecting a dam across the old one, under the direction of Dr. Pape, vicar of Pen. The corporation is held by prescription, and consists of a mayor, jurats, and freemen; and, ever since the reign of king Edward III., this place has sent two members to parliament, who are elected by the mayor and freemen. A store-house, called the Friary, was formerly a church belonging to the Augustins.

RYEGATE, a borough and market town of Surry, seated in the valley of Hohnsdale. It sends two members to the imperial parliament. It had a castle, the ruins of which are still to be seen; particularly a long vault, with a large room at one end, where the barons held their private meetings in the reign of king John, before they took up arms against him. It is sixteen miles east of Guildford, and twenty-one south-west of London. Market on Tuesday.

RYEGRASS. See HORDEUM.

RYEPOOR, a large town of Hindostan, province of Gundwanah, district of Choteesgur. It was formerly reckoned the second in the Nagpore dominions, and is situated on the road from Cuttack to Nagpore, in long. 82° 26' E., lat. 21° 17' N.

RYER (Peter Du), a French dramatic writer, born in Paris in 1605. He was secretary to the king, and afterwards became secretary to the duke of Vendome. He wrote for the booksellers, and his works procured him a place in the French Academy in 1646. He was afterwards made historiographer of France. He wrote nineteen dramatic pieces, and thirteen translations. He died in 1658.

RYMER (Thomas), esq., the author of the *Fœdera*, was born in the north of England, and educated at the grammar school of Northallerton.

He was admitted a scholar at Cambridge, then became a member of Gray's Inn, and at length was appointed historiographer to king William. He wrote *A View of the Tragedies of the Last Age*, and afterwards published a tragedy named *Edgar*. His *Fœdera*, a collection of all the public transactions, treaties, &c., of the kings of England with foreign princes, is esteemed one of our most authentic and valuable records, and is often referred to by the best English historians. It was published in London about 1700, in 17 vols. folio. Three were added by Sanderson after Rymer's death. The whole were reprinted at the Hague in 10 vols. in 1739. They were abridged by Rapin in French, and inserted in *Le Clerc's Bibliothèque*. Rymer died in 1713. Some specimens of his poetry are preserved in *Nichols's Select Collections*.

RYMER, THOMAS THE. See RHYMER.

RYNABAD, a town of Bengal, in the district of Jessore, stands on the south bank of the Boirub, and is one of the most frequented channels for boats coming down the country in the hot season, through the woods or *sunderbunds*. Long. 89° 44' E., lat. 22° 42' N.

RYNCIOPS, in ornithology, a genus belonging to the order of anseres. The bill is straight; and the superior mandible much shorter than the inferior, which is truncated at the point. The species are two, viz.

1. *R. fulva*, and 2. *R. nigra*, both natives of America.

RYSCHIA, in botany, a genus of the monogynia order, and pentandria class of plants: *cal.* pentaphyllous: *cor.* pentapetalous; the apices turned back, about three times the length of the calyx; the filaments are five, awl-shaped, and shorter than the petals: *caps.* quadrilobular, and contains many seeds. Of this there are two species, viz.

1. *R. clausifolia*; and 2. *R. souroubea*.

RYVES (Sir Thomas), an English lawyer, born about 1590, and educated at Winchester school, and the university of Oxford. He became a celebrated civilian in Doctors' Commons, and the court of Admiralty. On the accession of Charles I. he was made king's advocate, and knighted. He wrote, 1. *The Vicar's Plea*; 2. *Historia Navalis Antiqua*; 3. *Historia Navalis Media*. He died in 1651.

RZESZOW, one of the circles of Austrian Poland, lying along the southern frontier of the new kingdom of Poland, and containing a tract of 1675 square miles. It is watered by the San and the Wisloka, and has about 225,000 inhabitants. It is in general level and fertile, but is covered on the north side by almost impenetrable forests. The capital of the same name is a small town on the Wisloka, seventy miles west of Lemberg, and eighty east of Cracow. It is one of the best built towns of the Austrian part of Poland, and has a brisk traffic in corn and poultry. Inhabitants 4600.

S.

As a letter, S is the eighteenth in our alphabet, and the fourteenth consonant. The sound is formed by driving the breath through a narrow passage between the palate and the tongue, elevated near it, together with a motion of the lower jaw and teeth towards the upper, the lips being a little way open; with such a configuration of every part of the mouth and larynx as renders the voice somewhat hissing.

S has in English the same sound as in other languages, and unhappily prevails in so many of our words that it produces in the ear of a foreigner a continued sibilant. In the beginning of words it has invariably its natural and genuine sound; in the middle it is sometimes uttered with a stronger appulse of the tongue to the palate, like *z*, as *rose*, *rosy*, *osier*, *resident*, *business*. In the end of monosyllables it is sometimes *s*, as in *this*; and sometimes *z*, as in *as*, *has*; no noun singular should end with *s* single: therefore in words written with diphthongs, and naturally long, an *e* is nevertheless added at the end, as *goose*, *house*; and, where the syllable is short, the *s* is doubled, and was once *sse*, as *ass*, *anciently asse*; *wilderness*, *anciently wilderness*; *distress*, *anciently distresse*. In some words it is silent, as *isle*, *island*, *viscount*, &c. Of all other letters, the *s* is nearest akin to the *r*; whence it was frequently changed, on account of its disagreeable sound, into *r*. See *R*. Add to this, that the Latin nouns now terminating in *or*, as *arbor*, *labor*, &c., all *anciently* ended in *s*, as *arbos*, *labos*, &c. As an abbreviation, *S* stands for *societas* or *socius*; as, *R.S.S.* for *Regiæ societatis socius*; or *F.R.S.* *Frater regiæ societatis*, i. e. fellow of the royal society. See *ABBREVIATIONS*. As a numeral, *S* was *anciently* used for seven.

SAAD EDDIN MOHAMMED BEN HASSAN, known also by the appellation of Khodja Effendi, the most celebrated of the Turkish historians. He became preceptor to sultan Amurath III.; and was subsequently appointed mufti, which office he held till his death, about A.D. 1600. He was the author of *The Crown of Histories*, containing an account of all the Turkish emperors to his own times, translated into Italian by Vincent Brattuti, and into Latin by Kollar. A. L. Schloezer, in his *Critico-Historical Amusements*, Gottingen, 1797, 8vo., has given full details of this Chronicle, which has been continued from 1510, where the author concluded it, to 1751, by five other historiographers appointed by the sultans.

SAADE, a town of Arabia, the capital of the mountainous district of Yemen, called also the Sahan. It is the residence of a chief, who assumes the title of Imam; but who finds it difficult to maintain his ground. His revenue arises chiefly from a custom-house here established, at which duties are paid by goods passing into the interior. In the neighbourhood is a fortified height. 368 miles N.N. E. of Mocha.

SAAN LOUIS, a town of the Prussian province of the Lower Rhine, fortified by Vauban,

under Louis XIV., but ceded to Prussia by a treaty of Paris in 1815. During the revolution, this place was called *Sarre Libre*. It is eleven miles north-west of Saarbrück, and thirty-four east of Thionville, contains 4100 inhabitants, and has manufactures of iron and leather.

SAATZ, a circle of Bohemia, contiguous to the Saxon frontier, and to the circles of Leutmeritz, Rakonitz, and Elnbogen. Its area is about 820 square miles, is level towards the south, and contains some of the best corn land in Bohemia, but the north is traversed by the Erzgebirge mountains, in which there are mines of iron, alum, and tin. The woods are here also extensive. Other products of this circle are flax, hops, turf, and coal. There are some cotton manufactures. Population 114,000.

SAATZ, in Bohemian *Zatets*, a town of Bohemia, on the Egra, the chief place of the preceding circle. Population 3800. Eighty-nine miles west by north of Prague, and twenty-eight east of Carlsbad.

SAAVEDRA. See *CERVANTES*.

SABA, a Dutch island of the West Indies, is a great but fruitful rock, four leagues in circuit, without any road for ships, and with but one landing place, at a creek on the south side. One delightful valley produces necessaries for the few inhabitants, and materials for several manufactures; but, being destitute of a port, its commerce is inconsiderable. There is abundance of fish, particularly bonitos, caught on the coasts. Rocks appear for some distance on the coast, and vessels of course cannot come in, unless they be very small.

SAB'EANS, or SABEL. See *SABIANS*.

SAB'AOTH, *n.s.* Heb. עֲבָא. Signifying an army.

Holy Lord God of *sabaoth*; that is, Lord of hosts.
Common Prayer.

SABAZIA, in Greek antiquity, were nocturnal mysteries in honor of Jupiter Sabazius. All the initiated had a golden serpent put in at their breasts, and taken out at the lower part of their garments, in memory of Jupiter's ravishing Proserpine in the form of a serpent. There were also other feasts and sacrifices distinguished by this appellation, in honor of Mithras, the deity of the Persians.

SABBATARIANS, a sect of Christians, chiefly Baptists, who observe the Jewish or seventh-day Sabbath, from a persuasion that, being one of the ten commandments, which they contend are all in their nature moral, it was not abrogated by the New Testament. They say that Saturday must at least be deemed of equal validity for public worship with any day never particularly set apart by Jesus Christ and his Apostles. In our own country this sect is by no means numerous. They have but two congregations in London, if these are not united. In America, however, there are many Christians of this persuasion, particularly in Rhode Island, and New Jersey.

SABBATH, *n. s.* } Heb. שַׁבָּת, signifying
SABBATICAL, *adj.* } rest; Fr. *sabbat*; Lat. *sabbatum*. The day appointed by God for public worship among Jews and Christians: the adjective corresponding.

I purpose,
 And by our holy *sabbath* have I sworn,
 To have the due and forfeit of my bond.

Shakespeare.
 The usurer is the greatest *sabbathbreaker*, because
 his plough goes every Sunday. *Bacon's Essays.*

The *sabbathless* pursuit of wealth is the present
 disease of Great Britain. *Bacon.*

Never any *sabbath* of release
 Could free his travels and afflictions deep.
Daniel's Civil War.

Glad we returned up to the coasts of light,
 Ere *sabbath* ev'ning. *Milton.*

Nor can his blessed soul look down from heaven,
 Or break the eternal *sabbath* of his rest,
 To see her miseries on earth. *Druden.*

The appointment and observance of the *sabbatical*
 year, and, after the seventh *sabbatical* year, a year
 of jubilee, is a circumstance of great moment. *Forbes.*

Peaceful sleep out the *sabbath* of the tomb,
 And wake to raptures in a life to come. *Pope.*

SABBATH, Heb. שַׁבָּת, i. e. rest. The seventh day was so denominated, because in it God had rested from his works of creation. From that time the seventh day was set apart for religious services; and, by a particular injunction, was afterwards observed by the Hebrews as a holy day. They were commanded to set it apart for sacred purposes in honor of the creation being completed in six days, God resting on the seventh.

The importance of the institution may be gathered from the different laws respecting it. When the ten commandments were published from Mount Sinai, the law of the Sabbath held a place in what is commonly called the first table, and by subsequent statutes the violation of it was punished with death. Six days were allowed for the service of man; but the seventh God reserved to himself, and appointed it to be observed as a stated time for holy offices, and the duties of piety and devotion. On this day the ministers of the temple entered upon their week; and those who had attended on the temple service the preceding week went out at the same time. New loaves of show-bread were placed upon the golden table, and the old ones taken away. Two lambs for a burnt-offering, with a certain proportion of fine flour mingled with oil, and wine for a libation, were offered. The Sabbath too was celebrated from evening to evening. It began at six in the evening on Friday, and ended at the same time the next day. Concerning the time at which the Sabbath day was first instituted, different opinions have been held, some have maintained that the sanctification of the seventh day, mentioned in Gen ii., is only there spoken of *δια προλεψιν*, or by anticipation; and is to be understood of the Sabbath afterwards enjoined the children of Israel. But it cannot be supposed that the inspired penman would have mentioned the sanctification of the seventh day amongst the primeval transactions, if such sanctification had not taken place until 2500 years afterwards.

From the accounts we have of the religious service practised in the patriarchal age, it appears that, immediately after the fall, when Adam was restored to favor through a mediator, a stated form of public worship was instituted, which man was required to observe, in testimony, not only of his dependence on the Creator, but also of his faith and hope in the promise made to our first parents, and seen afar off. It is no objection to the early institution of the Sabbath that it is not mentioned in the history of the patriarchal age. When Moses wrote the book of Genesis it was unnecessary to relate minutely transactions and institutions already well known by tradition; accordingly we see that his narrative is every where very concise, and calculated only to preserve the memory of the most important facts. The Sabbath is first taken notice of as a well known solemnity; and the incidental manner in which it is mentioned is a convincing proof that the Israelites were no strangers to the institution; for, had it been a new one, it must have been enjoined in a positive and particular manner, and the nature of it must have been laid open and explained, otherwise the term would have conveyed no meaning.

The division of time into weeks, or periods of seven days, which obtained so early and almost universally, is a strong indication that one day in seven was always distinguished in a particular manner. God commanded Noah, seven days before he entered the ark, to introduce into it all sorts of living creatures. When the waters of the flood began to abate, Noah sent forth a dove, which, finding no rest for the sole of her foot, returned to him. After seven days he sent forth the dove a second time; again she returned to the ark, &c. This septenary division of time has been, from the earliest ages, uniformly observed over all the eastern world. The Assyrians, Egyptians, Arabians, and Persians, made use of a week, consisting of seven days. Many vain attempts have been made to account for this uniformity; but a practice so general and prevalent could never have taken place had not the septenary distribution of time been instituted from the beginning, and handed down by tradition. From the same source also must the ancient heathens have derived their notions of the sacredness of the seventh day. That they had such notions of it is evident from several passages of the Greek poets, quoted by Aristobulus, a learned Jew, by Clement of Alexandria, and Eusebius.

——— ἐβδομη, ἡρον ημαρ. Hesiod.

The seventh, the sacred day.

Εβδοματη δ' ηπειτα καθηλυθεν, ἡρον ημαρ. Homer.

Afterwards came the seventh, the sacred day.

That they likewise held the number seven in high estimation has been also shown. The Pythagoreans call it the venerable number, *σεβασμῆς αἷος*, worthy of veneration, and held it to be perfect and most proper to religion. These facts can be accounted for only by admitting the primeval institution of the Sabbath, as related by Moses in the book of Genesis. That institution was absolutely necessary to preserve among men a sense of religion; and it was renewed

the Jews at the giving of the law, and its observance enforced by the severest penalties. It was accordingly observed by them with more or less strictness in every period of their commonwealth and kingdom; and there is no one of the institutions of their divine lawgiver which, in their present state of dispersion, they more highly honor. In the time of the Maccabees they carried their respect for the Sabbath so very high that they would not on that day defend themselves from the attacks of their enemies. But afterwards they did not scruple to stand upon their necessary defence, although they would do nothing to prevent the enemy from carrying on their operations. When our Saviour was on earth, it was no sin to loose a beast from the stall, and lead him to water; and, if he had chanced to fall into a ditch, they pulled him out; but now it is absolutely unlawful to give a creature in that situation any other assistance than that of food. Their various ceremonies are so trifling, superstitious, and ridiculous, that we think it would be disgracing a work of science to take up room with them. Vide Buxtorf's *Judaica Synagoga*; and Allen's *Modern Judaism*.

As the seventh day was observed by the Jewish church, in memory of the rest of God after the works of creation, so the first day of the week has always been observed by the Christian church, in memory of the resurrection of Jesus Christ, by which he completed the work of man's redemption on earth, and rescued him from the dominion of him who has the power of death. This day was denominated by the primitive Christians the Lord's Day, or Sunday, but it was never styled the Sabbath; a name solely appropriated to Saturday, or the seventh day, both by sacred and ecclesiastical writers. Of the change from the seventh to the first day of the week, or even of the institution of the Lord's Day festival, there is no account in the New Testament. However, it may be fairly inferred from it that the first day of the week was, in the apostolic age, a stated time for public worship. On this day the apostles were assembled, when the Holy Ghost came down so visibly upon them to qualify them for the conversion of the world. On this day we find St. Paul preaching at Troas, when the disciples came to break bread: and the directions which the same apostle gives to the Corinthians, concerning their contributions for the relief of their suffering brethren, plainly allude to their religious assemblies on the first day of the week. From the consentient evidence and uniform practice of the primitive church, and also from the attestation of Pliny, we find that the first day of the week was observed in the earliest ages as a holy day or festival, in honor of the resurrection of Christ. In the early ages this day was occupied in a constant attendance on all the offices of divine worship. On it they held their religious assemblies, in which the writings of the apostles and prophets were read to the people, and the doctrines of Christianity pressed upon them by the exhortations of the clergy. Solemn prayers and praises were offered up to God, and hymns sung in honor of Christ; the Lord's supper was celebrated; and collections were made for the main-

tenance of the clergy and the relief of the poor. On this day they abstained, as much as they could, from bodily labor. They looked upon it as a day of joy and gladness; and therefore all fasting on it was prohibited, even during Lent, their great annual fast.—Such was the zeal of those times that nothing, no, not the severest persecutions, hindered them from celebrating holy offices on this day; and, when they could not meet in the day time, they assembled in the morning before it was light. When the empire became Christian, Constantine and his successors made laws for the more solemn observation of the Lord's day. They prohibited all prosecutions and pleadings, and other juridical matters, to be transacted on it, and also all unnecessary labor.

SABBATH BREAKING, or profanation of the Lord's day, is punished by the municipal laws of England. The keeping one day in seven holy, as a time of relaxation and refreshment, as well as for public worship, is of great service to a state, considered merely as a civil institution. The laws of king Athelstan forbid all merchandising on the Lord's day, under very severe penalties. And by the statute 27 Henry VI., c. 5, no fair or market shall be held on the principal festivals, Good Friday, or any Sunday (except the four Sundays in harvest), on pain of forfeiting the goods exposed to sale. And by the statute 1 Car. I., c. 1, no persons shall assemble, out of their own parishes, for any sport whatsoever, upon this day; nor, in their parishes, shall use any bull or bear beating, interludes, plays, or other unlawful exercises or pastimes, on pain that every offender shall pay 3s. 4d. to the poor. By statute 29 Car. II., c. 7, no person is allowed to work on the Lord's day, or use any boat or barge, or expose any goods to sale, except meat in public houses, milk at certain hours, and works of necessity or charity, on forfeiture of 5s.

SABBATH DAY'S JOURNEY, a measure, among the ancient Jews, of 729 English paces and three feet; or 2000 cubits; or 3648 feet.

SABBATICAL YEAR, or the year of jubilee, among the ancient Jews, was every seventh year; in which it was unlawful to till the ground, and all slaves were set at liberty, except those who preferred continuing in service to freedom. There was also a grand sabbatical year held by the Jews with uncommon splendor every forty-ninth year; though some commentators assert it was held the fiftieth year. See **JUBILEE**.

SABEANS, in ancient history, a tribe of Arabs, descended from Sheba, the son of Cush, or from Sheba, the son of Raamah, and grandson of Cush. They inhabited the country called Saba or Sheba; they carried off Job's cattle, and were afterwards conquered by Cyrus.

SABEANS, in ecclesiastical history, a sect of Christian heretics, who held mixed doctrines derived from Christianity, Judaism, Mahometanism, and Paganism. They adopted baptism after the example, and in commemoration of, John the Baptist; but did not administer it in the name of the Trinity. They have four sacraments; baptism, the eucharist, orders, and marriage. Both ministers and laity are allowed two wives. They still retain some knowledge of the gospel;

but their superstitious ceremonies and frequent washings are supposed to be of Jewish origin, and derived from the Hemerobaptists, who had a chief of the name of John.

SABELLI, an ancient people of Italy, descended from the Sabines, or, as others say, of the Samnites. They inhabited that part of Italy which lay between the Sabines and the Marsi.

SABELLIANS, in ecclesiastical history, a sect of the third century, who embraced the opinions of Sabellius. They maintained that the Word and the Holy Spirit are only virtues, emanations, or functions of the Deity; and held that he who is in heaven is the Father and Creator of all things, that he, through the virgin, became a child; and that, having accomplished the mystery of our salvation, he diffused himself on the apostles in tongues of fire, and was then denominated the Holy Ghost. This they explained by resembling God to the sun, the illuminative virtue or quality of which was the Word, and its warming virtue the Holy Spirit. The Word, they taught, was darted like a divine ray, to accomplish the work of redemption; and that, being re-ascended to heaven, the influences of the Father were communicated after a like manner to the apostles. They were anathematised in a council held at Constantinople, A.D. 381.

SABELLICUS (Mark Anthony Coccius), a learned Italian, born at a small town upon the Teveron, in the fifteenth century. He became professor of belles lettres at Vicenza, and died in the seventieth year of his age.

SABELLIUS, an ancient philosopher of Egypt, the founder of the sect of the Sabellians, was a native of Libya. He first broached his doctrines in the third century, about the year 255, in Ptolemais. He taught, according to Epiphanius, that the same person is Father, Son, and Holy Ghost; so that there are only three denominations in one hypostasis or subsistence; or, as in man, body, soul, and spirit. This author says that the Sabellians agreed with the Noetians, except in one thing, viz. that they said the Father did not suffer. Theodoret's account of Sabellius is, that he taught the Father, and the Son, and the Holy Spirit, to be one hypostasis or subsistence, and one person with three names; that he speaks of the same sometimes as Father, sometimes as Son, and sometimes as Holy Ghost.

SABIA, a country of Eastern Africa, to the south of Sofala, traversed by a river of the same name, which falls into the Indian Ocean. Slaves, ivory, and gold dust, may be procured here.

SABIANS, or SABAËNS, an ancient sect of idolaters, who worshipped the sun. Some critics derive the name from the Hebrew Tsaba, a host or army, because they worshipped the host of heaven, the Tsaba hememim, against which idolatry Moses cautions the Israelites. The word is sometimes also written Sabaïtes, Zabæans, Zabians, Zabaites, Tsabæans, Tsabians, and Tsabaists. Mahomet, in the Koran, and the Arabian authors since him, make frequent mention of them. Beidavius, in his comment on the Koran, represents them as a kind of mean between the Christians and the Magusians, who are the followers of the Magi among the Persians:

he adds, that they pretend to be of the religion of Noah. Some charge them with worshipping the stars; and others the angels or demons. Maimonides attributes both to them.

Sale, in his preliminary discourse to the Koran, has given the following brief account of the tenets and worship of this sect:—They believe in the existence of one God, though they also pay an adoration to the stars, or the angels and intelligences which they suppose reside in them, and govern the world under the supreme Deity. They endeavour to perfect themselves in the four intellectual virtues, and believe the souls of wicked men will be punished for 9000 ages, but will afterwards be received to mercy. They are obliged to pray three times a day, before sunrise, before noon, and before sun-set; and in praying they turn their faces, as some say, to the north; according to others to the south, to Mecca, or to the star to which they pay their devotion. They have three fasts in the year; the first lasts thirty days, the second nine days, and the last seven. They offer many sacrifices, of which they eat no part, but wholly burn them. They abstain from beans, garlic, and some other pulse and vegetables.

SABINA (Julia), a Roman lady, who married the emperor Adrian, by advice of Plotina, Trajan's widow. She is celebrated for her virtues, but was ill used by her husband, though she assisted in raising him to the empire. Some say he even poisoned her. She had been thirty-eight years married to him when she died A.D. 138.

SA'BINE, *n. s.* Fr. *sabine*; Lat. *sabina*. A plant.

Sabine or *savin* will make fine hedges, and may be brought into any form by clipping much beyond trees. *Mortimer.*

SABINE, or SAVIN. See JUNIPERUS.

SABINES, or SABINI, an ancient nation of Italy, reckoned among the Aborigines. Some, however, say they were originally a colony of Spartans, who settled in that part of Italy. Their territories were situated in the neighbourhood of Rome between the Nar and the Anio, and bounded on the north by the Appennines and Umbria; east by the dominions of the Æqui; south by Latium; and west by Etruria. Their chief cities were Cures, Fidenæ, Crustumium, Collatia, Corniculum, Nomentum, and Reate. The greatest part of the neighbouring nations were descended from them; particularly the Sabelli, the Samnites, the Umbrians, Æqui, Brutii, Marsi, &c. Under their king Titus Tatius they made war with the Romans under Romulus, on account of the rape of their virgins; but, after several battles, the war was put an end to by the women on whose account it was commenced, who by this time were attached to their Roman husbands; a peace was concluded, the nations united, and Romulus and Tatius reigned jointly for six years over both nations, till Tatius was killed. See ROME. After this they occasionally revolted, but were finally subdued and incorporated as Roman citizens about A.U.C. 373.

SABINUS, a native of Sparta, the founder of the Sabine nation, to whom he gave name. He was deified after his death.

SABINUS (Flavius), a brother of the emperor Vespasian, famed for his fidelity to Vitellius. He commanded the Roman armies thirty-five years, and governed Rome twelve years; but was killed in an insurrection of the people.

SABINUS (Julius), a Roman commander, who proclaimed himself emperor, in opposition to Vespasian, but, being defeated soon after, hid himself for nine years in a cave, attended by his wife and two faithful domestics; but being discovered he was dragged before Vespasian, and by his order put to death, though his wife endeavoured to excite Vespasian's compassion, by showing him the twins she had borne in the cave.

SABINUS (Francis Floridus), a learned writer, who flourished soon after the restoration of letters in Europe. His chief works are, *In Calumniatores Plauti et aliorum lingue Latine scriptorum apologia*, Basil, 1540; and *Lectionum Successivorum libri tres*. Franc. 1602, 8vo. He died in 1547.

SABINUS (George), a celebrated Latin poet, born in the electorate of Brandenburg in 1508. His poem, *Res gestæ Caesarum Germanorum*, spread his reputation all over Germany, and procured him the patronage of several princes; he was made professor of the belles lettres at Frankfurt on the Oder, rector of the academy of Königsburg, and counsellor to the elector of Brandenburg. He married two wives, the first was the eldest daughter of the famous reformer Melancthon. He died in 1560. His poems have been often printed.

SABIONCELLO, or **SABIONEIRA**, a peninsula of Austrian Dalmatia, having the islands of Curzolo and Meleda on the south, and on the north the island of Lesina, from which it is separated by a part of the gulf of Venice called the Canal of Sabioncello, or the Stagno. Forty-five miles north-west of Ragusa.

SABIONETTA, a town of Mantua, now Austrian Italy, with a castle. It was for a time the capital of a principality of the same name, given in 1806, by an imperial decree of Buonaparte, to his sister Paulina, and her husband, the prince Borghese, duke of Guastalla. Nineteen miles S. S. W. of Mantua. Inhabitants 6000.

SABLE, *n. s. & adj.* Fr. *sable*; Swed. *sabel*; Lat. *zibella*. Fur; black.

By this the drooping daylight 'gan to fade,
And yield his room to sad succeeding night,

Who with her *sable* mantle 'gan to shade
The face of earth, and ways of living wight.

Færie Queene.

Furiously running in upon him with tumultuous speech, he violently rought from his head his rich cap of *sables*. *Knolles.*

Sable is worn of great personages, and brought out of Russia, being the fur of a little beast of that name, esteemed for the perfectness of the colour of the hairs, which are very black. Hence *sable*, in heraldry, signifies the black colour in gentlemen's arms.

Peucham on Blazoning.

With him intron'd
Sat *sable*-vested night, eldest of things,
The consort of his reign. *Milton's Paradise Lost.*

They soon begin that tragic play,
And with their smoky cannons banish day.
Night, horror, slaughter, with confusion meet,
And in their *sable* arms embrace the fleet. *Waller*

Adoring first the genius of the place,
And night, and all the stars that gild her *sable*
throne. *Dryden.*

The peacock's plumes thy tackle must not fail,
Nor the dear purchase of the *sable's* tail. *Gay.*

SABLE, in heraldry, signifies black; and, in engraving, is expressed by horizontal and perpendicular lines crossing each other. Alexander Nisbet says that 'the duke of Anjou, king of Sicily, after the loss of that kingdom, appeared at a tournament in Germany all in black, with his shield of that tincture, *semé de larmes*, i. e. sprinkled with drops of water to represent tears, indicating by that both his grief and loss.

SABLE, in zoology. See **MUSTELA**. The chase of these animals, in the more barbarous times of the Russian empire, was the employ, or rather task of the unhappy exiles in Siberia. As that country is now become more populous, the *sables* have in a great measure quitted it, and retired north and east to live in desert forests and mountains; they live near the banks of rivers, or in the little islands in them; on this account they have by some been supposed to be the *Σαβειρον* of Aristotle (*Hist. An. lib. viii. c. 5*), which he classes with the animals conversant among waters. The hunters of *sables* formed themselves into troops, from five to forty each; the last subdivided into lesser parties, and each chooses a leader, but one directs the whole; a small covered boat is provided for each party, loaded with provisions, a dog and net for every two men, and a vessel to bake their bread in; each party has also an interpreter for the country they penetrate into. Every party then sets out according to the course their chief points out; they go against the stream of the rivers, drawing their boats up, till they arrive in the hunting country; there they stop, build huts, and wait till the waters are frozen, and the season commences. They then penetrate into the woods; mark the trees as they advance, that they may know their way back; and in their hunting quarters form huts of trees, and bank up the snow round them; near these they lay their traps; then advance farther, and lay more traps, still building new huts in every quarter, and return successively to every old one to visit the traps and take out the game to skin it, which the chief of the party alone must do; during this time they are supplied with provisions by persons who are employed to bring it on sledges, from the places on the road, where they are obliged to form magazines. The traps are a sort of pit-fall, with a loose board placed over it, baited with fish or flesh; when *sables* grow scarce the hunters trace them in the new-fallen snow to their holes; place their nets at the entrance; and sometimes wait two or three days for the coming out of the animal. The season of chase being over, the hunters re-assemble, make a report to their leader of the number of *sables* each has taken; share the booty; then continue at the head-quarters till the rivers are clear of ice; and afterwards return home.

SABLES, D'OLUNE DES, a port in the west of France, in La Vendée. It is well built, and has a harbour capable of admitting vessels of considerable size. The chief traffic is in bay

salt, corn, and cattle. It has an extensive fishery of pilchards. Inhabitants 5200. Forty-five miles south of Nantes.

SABLIÈRE (Anthony), de Rambouille de la, a French poet, who died in Paris in 1680. His Madrigals, which are much celebrated, were published after his death by his son.

SABOLCS, a palatinate of the east of Hungary, bounded on the west and north by the river Theyss. It has a superficial extent of 2120 square miles, consisting entirely of level ground; in part covered with sand, and another part with small lakes, of so little depth as to dry up in summer, when soda is found in the bottom. The Theyss often overflows its banks, and causes great ravages; yet this district produces large quantities of corn, tobacco, and fruit. The chief town is Nagy Kalló, and the inhabitants of the palatinate, amounting to 135,000, are Calvinists.

SABON, an island of a triangular form, at the south entrance of the straits of Malacca. It is about twenty-four miles in circumference, and separated from the island of Sumatra by a navigable channel, called the Straits of Sabon. Long. 103° 21' E., lat. 0° 42' N.

SABRE, *n. s.* Fr. *sabre*. I suppose of Turkish original, says Johnson: and we have Span. *sable*; Arab. *seif*. A cymetar; a short sword with a convex edge; a falchion.

To me the cries of fighting fields are charms;
Keen be my *sabre*, and of proof my arms;
I ask no other blessing of my stars,
No prize but fame, no mistress but the wars.

Dryden.

Seamed o'er with wounds, which his own *sabre*
gave,
In the vile habit of a village slave,
The foe deceived. *Pope's Odyssey.*

SABRE, a kind of sword with a very broad and heavy blade, thick at the back, and a little falcated or crooked towards the point: it is generally worn by the heavy cavalry. The grenadiers, belonging to the whole of the French infantry, are likewise armed with sabres. The blade is not so long as that of a small sword, but it is nearly twice as broad. French hussars wear the curved ones somewhat longer than those of the grenadiers.

SABRE-TASCHE, from the Ger. *tasche*, pocket. An appointment or part of accoutrement which has been adopted for the use and convenience of dragoon officers. It consists of a pocket which is suspended from the sword-belt on the left side, by three slings to correspond with the belt. It is usually of an oblong shape scalloped at the bottom with a device in the centre, and a broad lace round the edge. The color of it always corresponds with that of the uniform.

SACÆ, an ancient people of Scythia, who inhabited the country east of Bactriana and Sogdiana, north of Mount Imaus. They lived in tents and had no towns. Ptol. vi. 13, Herod. iii. c. 93.

SACÆA, a feast which the ancient Babylonians and other orientals held annually in honor of the deity Anaitas. The Sacæa were in the east what the Saturnalia were at Rome, viz. a feast for the slaves. One of the ceremonies was to choose a prisoner condemned to death, and

allow him all the pleasures and gratifications he could wish before he was carried to execution.

SACCANIA, one of the four provinces into which the Peloponnesus or Morea was divided by the Turks. It is bounded by the province of Zakounia (the ancient Laconia) by the isthmus of Corinth, and the gulfs of Lepanto, Egina, and Napoli, and comprehends the ancient territories of Corinth, Sicyon, and Argos, forming the north-east part of the Morea. See GREECE.

SACCHARINE, *adj.* Lat. *saccharum*. Having the taste, or any other of the chief qualities of sugar.

Manna is an essential *saccharine* salt, sweating from the leaves of most plants.

Arbutnot on Aliments.

SACCHAROMETER, the name of an instrument for ascertaining the value of worts, and the strength of different kinds of malt liquors. It is merely an hydrometer contrived to ascertain the specific gravity of worts, or rather to compare the weight of worts with that of equal quantities of the liquor employed in the brewery. The principle is as follows:—The menstruum or water employed by the brewer becomes heavier or more dense by the addition of such parts of the materials as have been dissolved or extracted by, and thence incorporated with it: the operation of boiling, and its subsequent cooling, still adds to the density of it by evaporation: so that, when it is submitted to the action of fermentation, it is more dense than at any other period. In passing through this operation a remarkable alteration takes place. The fluid no sooner begins to ferment than its density begins to diminish; and, as the fermentation is more or less perfect, the fermentable matter becomes more or less attenuated; and, in lieu of every particle thus attenuated, a spirituous particle, of less density than water, is produced; so that when the liquor is again in a state of quietude, it is so much specifically lighter than it was before, as the act of fermentation has been capable of attenuating the component parts of its acquired density.

SACCHARUM, the sugar cane, in botany, a genus of the digynia order and triandria class of plants; natural order fourth, gramina: *cal.* none but a long down: *cor.* bivalved. Species eleven; the chief is, *S. officinarum*, called by former botanists *arundo saccharifera*. It is a native of Africa, the East Indies, and of Brazil; whence it was introduced into our West India islands soon after they were settled. For the process of making sugar, see SUGAR.

SACCHI (Andrew), a celebrated painter, born at Rome in 1594. He was the disciple of Francis Albano, whom he afterwards surpassed in taste and correctness. He distinguished himself by his paintings in fresco, and arrived at a high degree of perfection. The works of Sacchi are finished with uncommon care and skill. He died in 1668.

SACCHOLACTIC ACID. See MUCIC ACID.
SACERDOTAL, *adj.* Lat. *sacerdotalis*. Priestly; belonging to the priesthood.

They have several offices and prayers, especially for the dead, in which functions they use *sacerdotal* garments. *Stillington.*

He fell violently upon me, without respect to my sacerdotal orders. *Dryden's Spanish Fryar.*

If ample powers, granted by the rulers of this world, add dignity to the persons intrusted with these powers, behold the importance and extent of the sacerdotal commission. *Atterbury.*

SACHEVERELL (Dr. Henry), a clergyman of the Tory faction in the reign of queen Anne; who distinguished himself by his sermons and writings against the dissenters. He owed his consequence, however, to being indiscreetly prosecuted by the house of lords for his assize sermon at Derby, and his sermon on the 5th of November, at St. Paul's, in 1709; in which he asserted the doctrine of non-resistance to government in its utmost extent; and reflected severely on the act of toleration. The high and low church parties were then very violent, and Sacheverell's trial inflamed the high church party to dangerous riots and excesses; he was, however, suspended for three years, and his sermons burned by the common hangman. The Tories being in administration when his suspension expired, he was freed with every mark of honor and public rejoicing; was ordered to preach before the commons on the 29th of May, had the thanks of the house for his discourse, and obtained the valuable rectory of St. Andrew's Holborn.

SACHITLEVEN (Cornelius and Herman), two celebrated Dutch painters. Herman was the most eminent. He was born at Rotterdam, in 1609, and was the disciple of Van Goyen. His pictures are rare and valuable. He died in 1685.

SACK, *n. s. & v. a.* } Sax. *ræc*; Heb. שָׂק ;
SACK-CLOTH, *n. s.* } Gr. *σακκος*; Lat. *saccus*.
 It is observable of this word, says Dr. Johnson, that it is found in all languages, and it is therefore conceived to be antediluvian. A bag; a pouch; commonly a large bag; to put in bags; hence to plunder; pillage: and, as a noun substantive, the storm of a town: sack-cloth explains itself.

Thus with sack-cloth I invest my woe,
 And dust upon my clouded forehead throw.

Sandys.

Edward Bruce spoiled all the old English pale inhabitants, and sacked and raised all cities and corporate towns. *Spenser.*

Vastius caused the authors of that mutiny to be thrust into sacks, and in the sight of the fleet cast into the sea. *Knolles.*

Our sacks shall be a mean to sack the city:
 And we be lords and rulers over Roan.

Shakspeare. Henry VI.

I'll make thee stoop and bend thy knee,
 Or sack this country with a mutiny. *Id.*

What armies conquered, perished with thy sword?
 What cities sacked? *Fairfax.*

Who sees these dismal heaps, but would demand
 What barbarous invader sacked the land? *Denham.*

If Saturn's son bestows
 Thy sack of Troy, which he by promise owes,
 Then shall the conquering Greeks thy loss restore. *Dryden.*

Now the great work is done, the corn is ground,
 The grist is sacked, and every sack well bound. *Betterton.*

The pope himself was ever after unfortunate,
 Rome being twice taken and sacked in his reign. *South.*

The great magazine for all kinds of treasure is the bed of the Tiber: when the Romans lay under the apprehensions of seeing their city sacked by a barbarous enemy, they would take care to bestow such of their riches this way as could best bear the water. *Addison.*

Being clad in sackcloth, he was to lie on the ground, and constantly day and night implore God's mercy for the sin he had committed. *Ayliffe's Paragon.*

Wood goes about with sackfuls of dross, odiously misrepresenting his prince's countenance. *Swift.*

Coarse stuff made of goats hair, of a dark colour, worn by soldiers and mariners; and used as a habit among the Hebrews in times of mourning. Called sackcloth, either because sacks were made of this sort of stuff, or because haircloths were straight and close like a sack. *Calmet.*

SACK. *Fr. sec.* Of uncertain etymology. A kind of sweet wine, now brought chiefly from the Canaries. The sack of Shakspeare is believed to be what is now called sherry.

Pleash you drink a cup of sack. *Shakspeare.*

The butler hath great advantage to allure the maids with a glass of sack. *Swift.*

Snuff the candles at supper on the table, because the burning snuff may fall into a dish of soup or sackposset. *Id.*

SACK was a wine used by our ancestors, which some have taken to be Rhenish, and some Canary wine. Venner, in his *Via Recta ad Vitam Longam*, printed in 1628, says 'that sack, taken by itself, is very hot and very penetrative; being taken with sugar, the heat is both somewhat allayed, and the penetrative quality thereof also retarded.' He adds that Rhenish, &c., decline after a year, but sack and the other stronger wines are best when they are two or three years old. It appears probable that sack was not a sweet wine, from its being taken with sugar, and that it did not receive its name from having a saccharine flavor, but from its being originally stored in sacks or borachios. It does not appear to have been a French wine, but a strong wine, the production of a hot climate. Perhaps it was what is called dry mountain, or some Spanish wine of that kind. This is the more probable, as Howell, in his *French and English Dictionary*, 1650, translates sack by *vin d'Espagne*, vin sec.

SACK'BUT, *n. s.* *Fr. sambuque*; *Span. sacabuche*; *Lat. sambuca*. A kind of pipe.

The trumpets, sackbuts, psalteries, and fife,
 Make the sun dance. *Shakspeare. Coriolanus.*

The **SACKBUT** is a musical instrument of the wind kind, being a sort of trumpet, though different from the common trumpet both in form and size; it is fit to play a bass, and is contrived to be drawn out or shortened, according to the tone required, whether grave or acute. The Italians call it *trombone*.

SACKVILLE (Thomas), lord Buckhurst, and earl of Dorset, a statesman and poet, was born in 1536. He was sent to Hart Hall in Oxford, in the end of the reign of Edward VI., whence he removed to Cambridge, where he took the degree of M. A., and thence to the Inner Temple, where he studied the law, and was called to the bar. He commenced poet whilst at the universities, and his juvenile productions were much admired. About the fourth year of queen

Mary, he was a member of the house of commons. In 1557 he wrote a poem entitled *The Induction, or the Mirror of Magistrates*. In 1551 his tragedy of *Gorboduc* was acted before queen Elizabeth by the gentlemen of the Inner Temple. In the first parliament of Elizabeth's reign Mr. Sackville was member for Sussex, and for Bucks in the second. In the mean time he made the tour of France and Italy, and in 1566 was imprisoned at Rome, when his father died; by which he became possessed of a very considerable fortune. Having obtained his liberty, he returned to England; and being knighted was created lord Buckhurst. In 1570 he was sent ambassador to France. In 1586 he was one of the commissioners appointed to try the unfortunate Mary queen of Scots; and was employed to report the confirmation of her sentence, and to see it executed. In 1587 he went ambassador to the states general, in consequence of their complaint against the earl of Leicester; who, disliking his impartiality, prevailed on the queen to recal him, and he was confined to his house. In this confinement he continued ten months, when, Leicester dying, he was restored to favor, and in 1580 was installed knight of the garter; but the greatest proof of the queen's partiality for him appeared in 1591, when she caused him to be elected chancellor of the university of Oxford, in opposition to her favorite Essex. In 1598, on the treasurer Burleigh's death, lord Buckhurst succeeded him, and became in effect prime minister; and when, in 1601, the earls of Essex and Southampton were brought to trial, he sat as lord high steward. On the accession of James I. he had the office of lord high treasurer confirmed to him for life, and was created earl of Dorset. He continued in high favor with the king till his death, which happened suddenly on the 19th of April, 1608, in the council chamber at Whitehall. He was interred in Westminster Abbey.

SACKVILLE (Charles), earl of Dorset, a celebrated wit and poet, was born in 1637. He was one of the libertines of king Charles II.'s court, and indulged in inexcusable excesses. He openly discountenanced the violent measures of James II., and engaged early for the prince of Orange, by whom he was made lord chamberlain of the household, and a member of the privy council. He died in 1706, and left several poetical pieces, which were published among the works of the minor poets in 1749.

SACRAMENT, *n. s.* } Fr. *sacrament*; Lat.
SACRAMENTAL, *adj.* } *sacramentum*. An
SACRAMENTALLY, *adv.* } oath; any ceremony
producing an obligation; an outward and visible sign of an inward and spiritual grace: the adjective and adverb corresponding.

As often as we mention a *sacrament*, it is improperly understood; for in the writings of the ancient fathers all articles which are peculiar to Christian faith, all duties of religion containing that which sense or natural reason cannot discern, are most commonly named *sacraments*. *Hooker*.

To make complete the outward substance of a *sacrament*, there is required an outward form, which form *sacramental* elements receive from *sacramental* words. *Id.*

Ten thousand French have ta'en the *sacrament*
To drive their dangerous artillery
Upon no Christian soul but English Talbot.

Shakspeare. Henry VI.

As we have ta'en the *sacrament*,
We will unite the white rose with the red.

Id. Richard III.

My body is *sacramentally* contained in this *sacrament* of bread. *Hall*.

The law of circumcision was meant by God *sacramentally* to impress the duty of strict purity.

Hammond.

The words of St. Paul are plain; and, whatever interpretation can be put upon them, it can only vary the way of the *sacramental* efficacy, but it cannot evacuate the blessing. *Taylor*.

Before the famous battle of Cressy, he spent the greatest part of the night in prayer, and in the morning received the *sacrament*, with his son, and the chief of his officers. *Addison*.

SACRAMENT is derived from the Latin *sacramentum*, which signifies an oath, particularly the oath taken by soldiers to be true to their country and general. The words of it, according to Polybius were, *obtemperaturus sum et facturus quicquid mandabitur ab imperatoribus juxta vires*. The word was adopted by the writers of the Latin church, and employed, perhaps with no great propriety, to denote those ordinances of religion by which Christians came under an obligation, equally sacred with that of an oath, to observe their part of the covenant of grace, and in which they have the assurance of Christ that he will fulfil his part of it. Of sacraments, in this sense of the word, Protestant churches admit of but two; and it is not easy to conceive how a greater number can be made out from Scripture, if the definition of a sacrament be just which is given by the church of England. By that church the meaning of the word is declared to be 'an outward and visible sign of an inward and spiritual grace given unto us, ordained by Christ himself as a means whereby we receive the same, and a pledge to assure us thereof.' According to this definition, baptism and the Lord's supper are certainly sacraments; for each answers the definition in the fullest sense of the words. See BAPTISM and SUPPER OF THE LORD. The Romanists, however, add to this number confirmation, penance, extreme unction, ordination, and marriage, holding in all seven sacraments; but two of those rites, not being peculiar to the Christian church, cannot be Christian sacraments, in contradistinction to the sacraments or obligations into which men of all religions enter. Marriage was instituted from the creation (see MARRIAGE); and penance or repentance has a place in all religions which teach that God is merciful and men fallible. The external severities imposed upon penitents by the church of Rome (see PENANCE) may indeed be in some respects peculiar to the discipline of that church, though the penances of the Hindoos are certainly as rigid; but none of these severities were ordained by Christ, as the pledge of an inward and spiritual grace; nor do they bring men under obligations analogous to the meaning of the word *sacramentum*. Confirmation has a better title to the appellation than any of the other five; though it certainly was

not considered as such by the earliest writers of the Christian church, nor does it appear to have been ordained by Christ himself. See CONFIRMATION. Ordination is by many churches considered as a very important rite; but as it is not administered to all men, nor has any particular form appropriated to it in the New Testament, it cannot be considered as a Christian sacrament conferring grace necessary to salvation. Extreme unction is a rite which took its rise from the miraculous powers of the primitive church, vainly claimed by the succeeding clergy. These considerations seem to have some weight with the Romish clergy themselves; for they call the eucharist, by way of eminence, the holy sacrament. Numerous as the sacraments of the Romish church are, a sect of Christians sprung up in England, early in the eighteenth century, who increased their number. The founder was a Dr. Deacon of Manchester, where the remains of it subsisted very lately. According to these men, every rite in the book called the apostolical constitutions was certainly in use among the apostles themselves. Still, however, they make a distinction between the greater and the less sacraments. The greater sacraments are baptism and the Lord's supper. The less are no fewer than ten; viz.:—five belonging to baptism, exorcism, anointing with oil, the white garment, a taste of milk and honey, and anointing with chrism or ointment. The other five are, the sign of the cross, imposition of hands, unction of the sick, holy orders, and matrimony. Of the nature of these less sacraments we need give no account. The sect which taught them, if not extinguished, is in its last wane. It has produced, however, one or two learned men; and its founder's Full, True, and Comprehensive View of Christianity, in two catechisms, is a work which the Christian antiquary will read with pleasure for information, and the philosopher for the materials which it contains for meditation on the workings of the human mind. It was published in 8vo. in 1748.

SACRAMENT, CONGREGATION OF THE HOLY, a religious establishment formed in France, whose founder was Antherius, bishop of Bethlehem, and which, in 1644, received an order from Urban VIII. to have always a number of ecclesiastics ready to exercise their ministry among pagan nations, wherever the pope or congregation de propaganda should appoint.

SACRAMENT (St.), or Colonia, a city and colony which was held by the Portuguese, opposite the city of Buenos Ayres, on the shore of the La Plata. It has a tolerable port, receiving some shelter from the island of St. Gabriel; yet it is otherwise open and exposed. It was founded by the Portuguese, in the year 1679, under Don Manuel de Lobo, and has occasioned many struggles between Spain and Portugal. The fortress of St. Gabriel, which protects the harbour, is reckoned a strong one. Thirty-three miles north-east from Buenos Ayres.

SACRAMENTARY, an ancient Romish church-book, which contains all the prayers and ceremonies practised at the celebration of the sacraments. It was written by pope Gelasius, and afterwards revised, corrected, and abridged, by St. Gregory.

SACRARIUM, in archæology, a sort of family chapel in the houses of the Romans. It differed from the *lararium*, inasmuch as that was dedicated to all the household deities without exception, while the *sacrarium* was devoted to some particular divinity. Cicero, in his oration for Milo, speaks of the *sacrarium de bona dea*. The name was also given to that particular portion of the ancient temples wherein the sacred things were deposited.

SACRED, *adj.* } Fr. *sacré*; Lat. *sacer*.
SACREDLY, *adv.* } Immediately relating to
SACREDNESS, *n. s.* } God; devoted to religious
uses; holy; mysterious: the derivatives corresponding.

Those who came to celebrate the sabbath, made a conscience of helping themselves for the honour of that most *sacred* day. *Macc.*

The honour's *sacred*, which he talks on now,
Supposing that I lackt it.

Shakspeare. Antony and Cleopatra
Poet and saint, to thee alone were given,
The two most *sacred* names of earth and heaven.

Cowley
Wolves shall succeed for teachers, grievous
wolves,

Who all the *sacred* mysteries of Heaven
To their own vile advantages shall turn. *Milton.*
Smit with the love of *sacred* song. *Id.*

O'er its eastern gate was raised above
A temple *sacred* to the queen of love. *Dryden.*

Secrets of marriage still are *sacred* held;
Their sweet and bitter by the wise concealed. *Id.*

This insinuates the *sacredness* of power, let the administration of it be what it will. *L'Estrange.*

When God had manifested himself in the flesh,
how *sacredly* did he preserve this privilege! *South.*

In the sanctuary the cloud, and the oracular answers, were prerogatives peculiar to the *sacredness* of the place. *Id.*

Before me lay the *sacred* text,
The help, the guide, the balm of souls perplexed.
Arbutnot.

SACRIFICABLE, *adj.* } Fr. *sacri-*
SACRIFICATOR, *n. s.* } *fier*; Lat. *sa-*
SACRIFICE, *v. a., v. n. & n. s.* } *crifico*. To
SACRIFICER, } offer to hea-
SACRIFICED, *adj.* } ven; to immo-
late as an atonement or propitiation: with to;
to offer a propitiatory victim: the act of offer-
ing, or thing offered: sacrificator is a redundant
synonyme of sacrificer: the other derivatives are
sufficiently plain.

Let us go to *sacrifice* to the Lord. *Exod. iii. 18.*

He that *sacrificeth* of things wrongfully gotten, his
offering is ridiculous. *Ecclus. xxxiv. 18.*

Alarbus' limbs are lopt,
And intrails feed the *sacrificing* fire.

Shakspeare. Titus Andronicus.
This blood, like *sacrificing* Abel's, cries
To me for justice. *Id. Richard II.*

Upon such *sacrifices*
The gods themselves throw incense.

Id. King Lear.
Let us be *sacrificers*, but not butchers. *Shakspeare.*

Rain *sacrificial* whisperings in his ear;
Make *sacred* even his stirrup. *Id. Timon.*

'Tis a sad contemplation that we should *sacrifice*
the peace of the church to a little vain curiosity.
Decay of Piety.

Men from the herd or flock
Of *sacrificing* bullock, lamb, or kid. *Milton.*

Some mischief is befallen
To that meek man who well had sacrificed. *Id.*
God will ordain religious rites
Of sacrifice. *Id.*

Although Jephtha's vow run generally for the words, whatsoever shall come forth; yet might it be restrained in the sense to whatsoever was *sacrificable*, and justly subject to lawful immolation, and so would not have *sacrificed* either horse or dog.

Browne's Vulgar Errours.

Not only the subject of *sacrifice* is questionable, but also the *sacrificator*, which the picture makes to be Jephtha. *Browne.*

Tertullian's observation upon these *sacrificial* rites is pertinent to this rule.

Taylor's Worthy Communicant.

When some brawny *sacrificer* knocks,
Before an altar led, an offered ox. *Dryden.*

The breach of this rule, To do as one would be done to, would be contrary to that interest men *sacrifice* to when they break it. *Locke.*

A priest pours wine between the horns of a bull: the priest is veiled after the manner of the old Roman *sacrificers.* *Addison.*

I saw among the ruins an old heathen altar, with this particularly in it, that it is hollowed like a dish at one end; but it was not this end on which the *sacrifice* was laid. *Id.*

Syphax loves you, and would *sacrifice*
His life, nay more, his honour to your service. *Id.*

Condemned to *sacrifice* his childish years
To babbling ignorance, and to empty fears. *Prior.*
A great genius sometimes *sacrifices* sound to sense. *Broome.*

A SACRIFICE is an offering made to God on an altar, as an acknowledgment of his power and a payment of homage. Sacrifices (though the term is sometimes used to comprehend all the offerings made to God, or in any way devoted to his service and honor) differ from mere oblations in this, that in a sacrifice there is a real destruction or change of the thing offered; whereas an oblation is only a simple offering or gift, without any such change at all: thus all sorts of tithes and first-fruits, and whatever of men's worldly substance is consecrated to God for the support of his worship and the maintenance of his ministers, are offerings or oblations; and these, under the Jewish law, were either of living creatures or other things: but sacrifices, in the more peculiar sense of the term, were either wholly or in part consumed by fire. Concerning the origin of sacrifices very various opinions have been held. By many the Phœnicians are supposed to have been the authors of them; though Porphyry attributes their invention to the Egyptians.

By modern deists, sacrifices are said to have had their origin in superstition. It is therefore weak (say they) to derive this practice from any particular people; since the same mode of reasoning would lead various nations, without any intercourse with each other, to entertain the same opinions respecting the nature of their gods, and the proper means of appeasing their anger. Men of gross conceptions imagine their deities to be like themselves, covetous and cruel. They are accustomed to appease an injured neighbour by a composition in money; and they endeavour to compound in the same manner with their gods, by rich offerings to their temples and to their priests. The most valuable property of a simple

people is their cattle. These offered in sacrifice are supposed to be fed upon by the divinity, and are actually fed upon by his priests. If a crime is committed which requires the punishment of death, it is accounted perfectly fair to appease the deity by offering one life for another; be cause, by savages, punishment is considered as a debt for which a man may compound, and which one man may pay for another. Hence, they allege, arose the notions of imputed guilt and vicarious atonement.—Had sacrifices never prevailed in the world but among such gross idolaters as worshipped departed heroes, who were supposed to retain in their state of deification all the passions and appetites of their mortal state, this account of the origin of that mode of worship would have been perfectly satisfactory. But we know from the most incontrovertible authority, that sacrifices were in use among people who worshipped the true God, and who must have had very correct notions of his attributes. Now we think it impossible that such notions could have led any man to fancy that the taking away of the life of a harmless animal, or the burning of a cake or other fruits of the earth in the fire, would be acceptable to a Being self-existent, omnipotent, and omniscient, who can neither be injured by the crimes of his creatures, nor receive any accession of happiness.

Some persons who admit the authenticity of the Jewish and Christian sacrifices, and firmly rely on the atonement made by Christ, are yet unwilling to allow that sacrifices were originally instituted by God. Of this opinion were St. Chrysostom, Spencer, Grotius, and Warburton, as were likewise the Jewish Rabbies, Maimonides, R. Levi, and Ben Gerson. The greater part of these writers maintain that sacrifices were at first a human institution, and that God, to prevent their being offered to idols, introduced them into his service, though he did not approve of them as good in themselves, or as proper rites of worship. Warburton's theory of sacrifice is more plausible. According to this ingenious prelate, sacrifices had their origin in the sentiments of the human heart, and in the ancient mode of conversing by action in aid of words. Gratitude to God for benefits received is natural to the mind of man, as well as his bounden duty. 'Expiatory sacrifices,' he says, 'were in their own nature intelligible. Here some chosen animal, precious to the repenting criminal, who deprecates the Deity who is to be appeased, was offered up and slain at the altar, an action which in all languages speaks to this purpose:—I confess my transgressions at thy footstool, O my God! and with the deepest contrition implore thy pardon. And I own that I myself deserve the death which I now inflict on this animal.' See Divine Legation, B. ix. c. 2. This system of sacrifice, which the bishop thinks so well supported by the most early movements of simple nature, we admit to be ingenious, but by no means satisfactory. The two chief observances in the Jewish ritual were the sabbath and sacrifices. Though the distinction of weeks was well known over all the eastern world, the Hebrews, during their residence in Egypt, were probably very negligent in their observance of

the sabbath. To enforce a religious observance of that sacred day it became necessary to inform them of the time and occasion of its first institution, that they might keep it holy in memory of the creation; but, in a country like Egypt, the people were in danger of holding sacrifices in too high rather than too low veneration, so that there was not the same necessity for mentioning explicitly the early institution of them. It was sufficient that they knew the divine institution of their own sacrifices, and the purposes for which they were offered. 'Faith,' says the apostle Paul, is the substance of things hoped for, the evidence of things not seen, and comes not by reasoning, but by hearing. What things then were they of which Abel, the first sacrificer, had heard, for which he hoped, and in the faith of which he offered sacrifice? Undoubtedly it was a restoration to that immortality which was forfeited by the transgression of his parents. Of such redemption an obscure intimation had been given to Adam, in the promise that the seed of the woman should bruise the head of the serpent; and it was doubtless to impress upon his mind in more striking colors the manner in which this was to be done that bloody sacrifices were first instituted. As long as such rites were thus understood they constituted a perfectly rational worship, as they showed the people that the wages of sin is death; but when men sunk into idolatry, and lost all hopes of a resurrection from the dead, the slaughtering of animals to appease their deities was a practice grossly superstitious. It rested in itself, without pointing to any farther end, and the grovelling worshippers believed that by their sacrifices they purchased the favor of their deities. When once this notion was entertained, human sacrifices were soon introduced. By the Jewish law these abominable offerings were strictly forbidden, and the whole ritual of sacrifice restored to its original purity.

All Christian churches have, till very lately, agreed in believing that the Jewish sacrifices served, among other uses, for types of the death of Christ and the Christian worship. Many are of opinion that they were likewise federal rites, as they certainly were considered by the ancient Romans. (Liv. 21, 45). Of the various kinds of Jewish sacrifices, and the subordinate ends for which they were offered, a full account is given in the books of Moses. When an Israelite offered a loaf or a cake, the priest broke it into two parts; and, setting aside that half which he reserved for himself, broke the other into crumbs, poured oil, wine, incense, and salt upon it, and spread the whole upon the fire of the altar. If these offerings were accompanied with the sacrifice of an animal, they were thrown upon the victim to be consumed along with it. If the offerings were of the ears of new corn, they were parched at the fire, rubbed in the hand, and then offered to the priest in a vessel, over which he poured oil, incense, wine, and salt, and then burnt it upon the altar, having first taken as much of it as of right belonged to himself. The principal sacrifices among the Hebrews consisted of bullocks, sheep, and goats: but doves and turtles were accepted from those who were not able to bring the other; these animals were to be perfect, and without blemish. The rites of

sacrificing were various, and are very minutely described in the books of Moses.

The manner of sacrificing among the Greeks and Romans was as follows:—In the choice of the victim, they took care that it was without blemish or imperfection; its tail was not to be too small at the end; the tongue not black, nor the ears cleft; and the bull must never have been yoked. The victim being pitched upon, they gilt his forehead and horns, especially if a bull, heifer, or cow. The head they also adorned with a garland of flowers, a woollen infula or holy fillet, whence hung two rows of chaplets with twisted ribands; and over the middle of the body a kind of stole, hung down on each side; the lesser victims were only adorned with garlands and bundles of flowers, together with white tufts or wreaths. The victims, thus prepared, were brought before the altar: the lesser being driven to the place, and the larger led by a halter; when, if they made any struggle, or refused to go, the resistance was taken for an ill omen, and the sacrifice often delayed. The victim, thus brought, was carefully examined, to see that there was no defect in it; then the priest, clad in his sacerdotal habit, and accompanied with the sacrificers and other attendants, and being washed and purified according to the ceremonies prescribed, turned to the right hand, and went round the altar, sprinkling it and those who were present with meal and holy water. Then the crier proclaimed with a loud voice, Who is here? To which the people replied, Many and good. The priest then having exhorted the people to join with him, by saying Let us pray, confessed his own unworthiness, acknowledging that he had been guilty of divers sins; for which he entreated pardon of the gods, hoping that they would grant his requests, accept the oblations offered, and send them all health and happiness; and to this general form added petitions for such particular favors as were then desired. The priest then took a cup of wine; and, having tasted it, caused his assistants to do the like; and then poured forth the remainder between the horns of the victim. Then the priest or the crier, or sometimes the most honorable person in the company, killed the beast, by knocking it down or cutting its throat. If the sacrifice was in honor of the celestial gods, the throat was turned up towards heaven, but if they sacrificed to the heroes or infernal gods, the victim was killed with its throat towards the ground. If by accident the beast escaped the stroke, leaped up after it, or expired with pain and difficulty, it was thought to be unacceptable to the gods. The beast being killed, the priest inspected its entrails, and made predictions from them. They then poured wine and frankincense into the fire, to increase the flame, and then laid the sacrifice on the altar; which in the primitive times was burnt whole to the gods, and thence called a holocaust; but in after-times only part of the victim was consumed in the fire, and the remainder reserved for the sacrificers; the thighs, and sometimes the entrails, being burnt to their honor, the company feasted upon the rest. During the sacrifice, the priest, and the person who gave the sacrifice, jointly prayed, laying their hand upon the altar. Sometimes they

played upon musical instruments in the time of the sacrifice, and on some occasions they danced round the altar, singing sacred hymns in honor of the gods.

Concerning the origin of human sacrifices various opinions have been formed. When men had indulged the fancy of bribing their gods by sacrifice, it was natural for them to think of enhancing the value of the atonement by the cost and rarity of the offering, and thus at last they offered that which they conceived to be the most precious of all, a human sacrifice. 'It was customary,' says Sanchoniathon, 'in ancient times, in great and public calamities before things became incurable, for princes and magistrates to offer up in sacrifice to the avenging demons the dearest of their offspring.' Sanchoniathon wrote of Phœnicia; but the practice prevailed in every nation of which we have received any ancient account. The people of Dumah, in particular, sacrificed every year a child, and buried it underneath an altar; for they did not admit of images. The Persians buried people alive. Hamestris, the wife of Xerxes, entombed twelve persons alive under ground. It would be endless to enumerate every city and province where these dire practices obtained. The Cyprians, the Rhodians, the Phœceans, the Ionians, those of Chios, Lesbos, Tenedos, all offered human sacrifices. The natives of the Tauric Chersonesus offered up to Diana every stranger whom chance threw upon their coast. Hence arose that just expostulation of Euripides in his *Iphigenia*, upon the inconsistency of the proceeding. Iphigenia wonders, as the goddess delighted in the blood of men, that every villain and murderer should be privileged to escape, nay, driven from the threshold of the temple; whereas, if an honest and virtuous man chanced to stray thither, he was only seized upon, and put to death. The Pelasgi, in a time of scarcity, vowed the tenth of all that should be born to them for a sacrifice, to procure plenty. Aristomenes the Messenian slew 300 noble Lacedæmonians, among whom was Theopompus the king of Sparta, at the altar of Jupiter at Ithome. The Lacedæmonians did not fail to make ample returns, and offered the like number of victims to Mars. Their barbarous festival of the *Diamastigosis* is well known. See *DIAMASTIGOSIS*. Phylarchus, as quoted by Porphyry, says that of old every Grecian state made it a rule, before they marched against an enemy, to solicit a blessing on their undertakings by human victims. The Romans were accustomed to the like sacrifices. They both devoted themselves to the infernal gods, and constrained others to submit to the same horrid doom. Hence we read in Livy that, in the consulate of Æmilius Paulus and Terentius Varro, two Gauls, a man and a woman, and two Greeks were buried alive at Rome in the ox-market. He says it was a sacrifice not originally of Roman institution; yet was often practised there by public authority. Plutarch mentions a similar instance a few years before, in the consulship of Flaminius and Furius. Caius Marius offered up his own daughter as a victim to the *Dii Averunci*, to procure success in a battle against the *Cimbri*; as we are

informed by Dorotheus, quoted by Clemens, and by Plutarch, who says that her name was Calpurnia. Cicero, mentioning this custom as common in Gaul, adds that it prevailed among the people even at the time he was writing; and Pliny says that it had then, and not very long, been discouraged. For there was a law enacted when Lentulus and Crassus were consuls, so late as A. U. C. 657, that there should be no more human sacrifices. They were, however, again offered, though they became not so general. For Augustus Cæsar, when Perusia surrendered during the second triumvirate, offered up, upon the Ides of March, 300 persons, of the equestrian and senatorial order, to the manes of his uncle Julius Cæsar. Even in Rome this custom was revived: and Porphyry assures us that in his time a man was every year sacrificed at the shrine of Jupiter Latialis. Heliogabalus offered similar victims to the Syrian deity which he introduced among the Romans. The same is said of Aurelian. The Gauls and Germans were so devoted to this shocking custom that no business of any moment was transacted among them without the blood of men. They were offered up to *Illusus*, *Taranis*, *Thautates*, &c. These deities are mentioned by Lucan. The altars of these gods were generally situated in the depth of woods, that the gloom might add to the horror of the operation. The persons devoted were led thither by the Druids, who presided at the solemnity, and performed the cruel office. Tacitus mentions the cruelty of the *Hermunduri*, in a war with the *Catti*, wherein they had greatly the advantage; at the close of which they made one general sacrifice of all their prisoners. The remains of the legions under Varrus suffered the same fate. There were many places destined for this purpose all over Gaul and Germany; but especially the woods of *Arduenna* (now *Ardennes*), and the great *Hercynian* forest; a wild that extended above thirty days' journey in length. The places set apart for this solemnity were held in the utmost reverence. Lucan mentions a grove of this sort near *Marsilia*, which even the Roman soldiers were afraid to violate, though commanded by Cæsar. Claudian compliments *Stilicho* that, among other advantages accruing to the Roman armies through his conduct, they could now venture into the awful forest of *Hercynia*, and follow the chace in those so much dreaded woods. These practices prevailed among all the nations of the north. The *Massagetæ*, the *Scythians*, the *Getes*, the *Sarmatians*, all the various nations upon the Baltic, particularly the *Suevi* and *Scandinavians*, held it as a fixed principle that their security could not be obtained but at the expense of the lives of others. Their chief gods were *Thor* and *Woden*, whom they thought they could never sufficiently glut with blood. They had many celebrated places of worship; especially in the island of *Rugen*, near the mouth of the *Oder*; and in *Zealand*, and among the *Semnonæ* and *Naharvalli*. But the most frequented was at *Upsal*; where there was every year a grand solemnity, which continued for nine days, during which they sacrificed animals of all sorts; but the most acceptable and numerous victims

were men. Of these none were esteemed so auspicious a sacrifice as the prince of the country. When the lot fell for the king to die, it was received with universal joy; as it once happened in the time of a famine, when they cast lots, and it fell to king Domalder to be the people's victim; and he was accordingly put to death. They did not spare their own children. Harold the son of Gunild slew two of his sons to obtain, says Verstegan, 'such a tempest at sea, as should break and disperse the shipping of Harold king of Denmark.' Another king slew nine sons to prolong his own life. Adam Bremensis, speaking of the awful grove at Upsal where these horrid rites were celebrated, says that there was not a single tree but was revered, as if gifted with some portion of divinity; because they were stained with gore and foul with human putrefaction. The same is observed by Scheiffer in his account of this place. The manner in which the victims were slaughtered was diverse in different places. Some of the Gaulish nations chined them with the stroke of an axe. The Celts placed the man who was to be offered for a sacrifice upon a block or an altar, with his breast upwards, and with a sword struck forcibly across the sternum; then tumbling him to the ground, from his agonies and convulsions, as well as from the effusion of blood, they formed a judgment of future events. The Cimbri ripped open the bowels; and from them they pretended to divine. In Norway they beat men's brains out with an ox-yoke. In Iceland they dashed them against an altar of stone. In many places they transfixed them with arrows. After they were dead, they suspended them upon the trees, and left them to putrefy. At one time seventy carcasses of this sort were found in a wood of the Seevi. Dithmar of Mersburg speaks of a place called Ledur in Zealand, where there were every year ninety-nine persons sacrificed to the god Swantowite. During these bloody festivals a general joy prevailed, and banquets were most royally served. They fed, caroused, and gave a loose to indulgence, which at other times was not permitted. Their servants were numerous, who attended during the term of their feasting, and partook of the banquet. But, at the close of all, they were smothered in the same pool, or otherwise made away with. On which Tacitus remarks how great an awe this circumstance must necessarily infuse into those who were not admitted to these mysteries. They imagined that there was something mysterious in the number nine: for which reason these feasts were in some places celebrated every ninth year, in others every ninth month; and continued for nine days. When all was ended, they washed the image of the deity in a pool; and then dismissed the assembly. These accounts are handed down from a variety of authors in different ages; many of whom were natives of the countries which they describe, and to which they seem strongly attached. The like custom prevailed to an excessive degree at Mexico (see Mexico), and even under the mild government of the Peruvians; and in most parts of America. But, among the nations of Canaan, the victims were peculiarly chosen.

Their own children, and whatever was nearest and dearest to them, were deemed the most worthy offering to their gods. The Carthaginians, who were a colony from Tyre, carried with them the religion of their country, and instituted the same worship in the parts where they settled. It consisted in the adoration of several deities, but particularly of Kronus, to whom they offered human sacrifices, and especially children. If the parents were not at hand to make an immediate offer, the magistrates did not fail to make choice of those who were most fair and promising. Upon a check being received in Sicily, Hamilcar laid hold of a boy, and offered him on the spot to Kronus; and at the same time drowned a number of priests to appease the deity of the sea. The Carthaginians, upon a great defeat of their army by Agathocles, imputed their miscarriages to the anger of this god, and seized at once 300 children of the nobility, and offered them for a sacrifice; 300 more yielded themselves voluntarily, and were put to death with the others. The Egyptians chose the most handsome persons to be sacrificed. The Albanians pitched upon the best man of the community, and made him pay for the wickedness of the rest. If a person had an only child, it was the more liable to be sacrificed, as being esteemed more acceptable to the deity, and more efficacious to the general good. Those who were sacrificed to Kronus were thrown into the arms of a molten idol, which stood in the midst of a large fire, and was red hot. The arms of it were stretched out, with the hands turned upwards, as it were to receive them; yet sloping downwards, so that they dropt thence into a glowing furnace below. To other gods they were otherwise slaughtered, often by the very hands of their parents. They embraced their children with great fondness, and encouraged them in the gentlest terms, that they might not be appalled at the sight of the hellish process; begging of them to submit with cheerfulness to this fearful operation. If there was any appearance of a tear rising, or a cry unawares escaping, the mother smothered it with her kisses, that there might not be any show of backwardness or constraint, but the whole be a free-will offering. These cruel endearments over, they stabbed them to the heart, or otherwise opened the sluices of life; and with the blood warm, as it ran, besmeared the altar and the grim visage of the idol. These were the customs which the Israelites learned of the people of Canaan, and for which they are upbraided by the Psalmist (cvi. 34—39). These cruel rites, practised in so many nations, made Plutarch doubt, 'Whether it would not have been better for the Galatæ, or for the Scythians to have had no tradition or conception of any superior beings, than to have formed to themselves notions of gods who delighted in the blood of men; of gods who esteemed human victims the most acceptable and perfect sacrifice. Would it not, says he, have been more eligible for the Carthaginians to have had the atheist Critias, or Diagoras their law-giver, at the commencement of their polity, and to have been taught that there was neither god nor demon, than to have sacrificed in the man-

ner they were wont to the god whom they adored? 'The mother, he adds, who sacrificed her child stood by, without any seeming sense of what she was losing, and without uttering a groan. If a sigh did escape she lost all the honor which she proposed to herself in the offering, and the child was notwithstanding slain. All the time of this ceremony, while the children were murdering, there was a noise of clari- ons and tabors sounding before the idol, that the cries and shrieks of the victims might not be heard.' 'Tell me now,' adds Plutarch, 'if the monsters of old, the Typhons, and the giants, were to expel the gods, and to rule the world in their stead; could they require a service more horrid than these infernal rites and sacrifices?'

SACRILEGE, *n. s.* } Fr. *sacrilege*; Lat.
SACRILEGIOUS, *adj.* } *sacrilegium*. The
SACRILEGIOUSLY, *adv.* } crime of appropri-
ating what is devoted to religion, or of violating
or profaning things sacred: the adjective and ad-
verb corresponding.

By what eclipse shall that sun be defaced,
What mine hath erst thrown down so fair a tower,
What *sacrilege* hath such a saint disgraced ?
Sidney.

Then 'gan a cursed hand the quiet womb
Of his great grandmother with steel to wound,
And the hid treasures in her sacred tomb
With *sacrilege* to dig. *Fuerie Queene.*
To *sacrilegious* perjury should I be betrayed, I
should account it greater misery. *King Charles.*
When these evils befel him, his conscience tells
him it was for *sacrilegiously* pillaging and invading
God's house. *South.*

We need not go so many ages back to see the ven-
geance of God upon some families, raised upon the
ruins of churches, and enriched with the spoils of *sac-
rilege*. *Id.*

Blasphemy is a male liction, and a *sacrilegious* de-
struction from the Godhead. *Ayliffe's Parergon.*
Still green with bays each ancient altar stands,
Above the reach of *sacrilegious* hands. *Pope.*

SACR'ING, *part.* } A participle of the
SA'CRIST, } French *sacrer*. The verb
SA'CRISTAN, } is not used in English.
SA'CRISTY. } Consecrating; a sacrist
or sacristan (Fr. *sacristain*) is one who has the
care of consecrated things: sacristy the place
where they are kept.

I'll startle you,
Worse than the *sacring* bell.

Shakspeare. Henry VIII.

The *sacring* of the kings of France is the sign of
their sovereign priesthood as well as kingdom, and
in the right thereof they are capable of holding all
vacant benefices. *Temple.*

Bold Amycus from the robbed vestry brings
A scone that hung on high,
With tapers filled to light the *sacristy*. *Dryden.*
A third apartment should be a kind of *sacristy*
for altars, idols, and sacrificing instruments.

Addison.

A *sacrist* or treasurer are not dignitaries in the
church of common right, but only by custom.

Ayliffe's Parergon.

SACROBOSCO (Joannes de), or John Hali-
fax, a celebrated mathematician of the thir-
teenth century, said by English biographers to
have been born at Halifax in Yorkshire, but both

Scots and Irish writers claim him as their coun-
tryman. After receiving his education at Ox-
ford, he entered into orders, and went to Paris,
where he died in 1256. He wrote, 1. *De*
Sphærâ Mundi; 2. *De Anni Ratione*; 3. *De*
Algorismo.

SACRUM, or Os basilare, the sacred bone,
so called from its being offered in sacrifice by
the ancients, or perhaps from its supporting the
organs of generation, which they considered as
sacred. In young subjects it is composed of
five or six pieces, united by cartilage; but in
more advanced age it becomes one bone, in
which, however, the marks of the former sepa-
ration may still be easily distinguished. Its
shape has been sometimes compared to an ir-
regular triangle; and sometimes, and perhaps
more properly, to a pyramid, flattened before
and behind, with its basis placed towards the
lumbar vertebrae, and its point terminating in the
coccyx. See ANATOMY.

SAD, *adj.* } Of this word, so frequent in
SAD'DEN, *v. a.* } the language, the etymology is
SAD'LY, *adv.* } not known, says Johnson.
SAD'NESS, *n. s.* } Goth. *sal*, grief.—Thomson.
Sorrowful; full of grief: hence heavy; gloomy;
bad; cohesive: to sadden is to make sad: and
the adverb and noun substantive correspond.

Be not as the hypocrites of a *sad* countenance.

Matthew.

Do you think I shall not love a *sad* Pamela so
well as a joyful ? *Sidney.*

With that his hand, more *sad* than lump of lead,
Uplifting high, he weened with Morddure,
His own good sword, Morddure to cleave his head.

Faerie Queene.

My father has gone wild into his grave;
For in his tomb lie my affections;
And with his spirits *sadly* I survive,
To mock the expectations of the world.

Shakspeare. Henry IV.

It ministreth unto men, and other creatures, all
celestial influences; it dissipateth those sad thoughts
and sorrows which the darkness both begetteth and
maintaineth. *Raleigh.*

If it were an embassy of weight, choice was made
of some *sad* person of known judgment and expe-
rience, and not of a young man, not weighed in state
matters. *Bacon.*

A *sad* wise valour is the brave complexion
That leads the van, and swallows up the cities:

The giggler is a milk-maid, whom infection,
Or a fired beacon, frighteth from his ditties.

Herbert.

The soul receives intelligence
By her near genius of the body's end,
And so imparts a *sadness* to the sense.

Daniel's Civil War.

A passionate regret at sin, a grief and *sadness* of
its memory, enter into God's roll of mourners.

Decay of Piety.

And let us not be wanting to ourselves,
Lest so severe and obstinate a *sadness*
Tempt a new vengeance. *Denham's Sophy.*

Thoughts in my unquiet breast are risen,
Tending to some relief of our extremes,
Or end, tho' sharp and *sad*, yet tolerable. *Milton*

Up into heaven, from Paradise in haste
Th' angelic guards ascended, mute and *sad*. *Id.*

Dim *sadness* did not spare
Celestial visages. *Id.*

Crystal, in its reduction into powder, bath a vale

and shadow of blue; and in its coarse pieces is of a sadder hue than the powder of Venice glass.

Browne's Vulgar Errors.

I met him accidentally in London in sad coloured coats, far from being costly.

Walton's Life of Bishop Sanderson.

Scarce any tinging ingredient is of so general use as woad, or glastum; for though of itself it dye but a blue, yet it is used to prepare cloth for a green, and many of the sadder colours, when the dyers make them last without fading.

Boyle.

He sadly suffers in their grief,
Out-weeps an hermit, and out-prays a saint.

Dryden.

If the subject be mournful, let every thing in it have a stroke of sadness.

Id.

Woad or wade is used by the dyers to lay the foundations of all sad colours.

Mortimer's Husbandry.

Marl is binding, and saddening of land is the great prejudice it doth to clay lands.

Id.

We may at present easily see, and one day sadly feel.

South.

These qualifications make him a sad husband.

Addison.

Her gloomy presence saddens all the scene,
Shades every flower, and darkens every green;
Deepens the murmurs of the falling floods,
And breathes a browner horror on the woods. *Pope.*
See in her cell sad Eloisa spread,
Propped on some tomb, a neighbour of the dead.

Id.

SAD'DLE, *n. s. & v. a.*

Sax. *saðl*; Goth.

SAD'DLE-BACKED, *adj.*

scda; Dan. and

SAD'DLE-MAKER, *n. s.*

Belg. *sadel*; Wel.

SAD'DLER.

saddell. The seat

which is put upon a horse: to cover with a saddle; to burden: saddle-backed is defined in the extract: saddle-maker and saddler, a manufacturer of saddles.

I will saddle me an ass, that I may ride thereon.

2 Sam.

His horse hipped, with an old moth-eaten saddle, and the stirrups of no kindred

Shakspeare. Taming of the Shrew.

Sixpence that I had

To pay the saddler for my mistress' crupper,
The saddler had it.

Id. Comedy of Errors.

The law made for apparel, and riding in saddles, after the English fashion, is penal only to Englishmen.

Davies.

Rebels, by yielding, do like him, or worse,
Who saddled his own back to shame his horse.

Cleveland.

The utmost exactness in these belongs to farriers, saddlers, and smiths.

Digby.

One hung a pole-axe at his saddle bow,
And one a heavy mace.

Dryden's Knight's Tale.

Resolved for sea, the slaves thy baggage pack,
Each saddled with his burden on his back;
Nothing retards thy voyage.

Dryden.

Horses, saddle-backed, have their backs low, and a raised head and neck.

Farrier's Dictionary.

No man, sure, e'er left his house,
And saddled Ball, with thoughts so wild,

To bring a midwife to his spouse,

Prior.

The smith and the saddler's journeyman ought to partake of your master's generosity.

Swift's Directions to the Groom.

SADDLE, in archæology. In the earlier ages the Romans used neither saddle nor stirrups, and hence the Roman cavalry were subject to

sundry maladies in the hips and legs from the want of some support for their feet. Hippocrates observes that the Scythians, who were much on horseback, were incommoded by defluxions in the legs from the same cause. In less remote times, the Romans placed upon their horses a square pannel, or species of covering which enabled them to sit less hardly. This they termed *ephippium*.

The saddles now chiefly in use are:—The *running saddle*, which is a small one with round skirts. The *Burford saddle*, which has the seat and the skirts both plain. The *pad saddle*, of which there are two sorts, some made with burs before the seat, and others with bolsters under the thighs. The *French pad saddle*, of which the burs come wholly round the seat. The *portmanteau saddle*, that has a cantle behind the seat, to keep the portmanteau from the back of the rider. A *war saddle*, which has a cantle and a bolster behind and before; also a fair bolster. The *pack saddle*, a saddle upon which loads may be carried.

The several parts of a saddle are too well known to require any minute description in this place.

SADDUCEES, a sect among the ancient Jews respecting whose origin there are various opinions. Epiphanius and others contend that they took their rise from Dositheus, a sectary of Samaria, and their name from the Hebrew word *צדק*, just, from the great justice and equity which they showed in their actions. In the Jewish Talmud we are told that the Sadducees derived their name from Sadoc, or Zadoc, and that the sect arose about 260 years before Christ, in the time of Antigonus of Socho, president of the Sanhedrim at Jerusalem, and teacher of the law. He had often in his lectures taught his scholars that they ought not to serve God as slaves do their masters, from the hope of a reward, but merely out of filial love for his own sake; from which Sadoc and Baithas inferred that there were no rewards after this life. They therefore separated from their master, and taught that there was no resurrection nor future state. This new doctrine quickly spread, and gave rise to the sect of Sadducees, which in many respects resembled the Epicureans. Dr. Prideaux thinks that the Sadducees were at first no more than what the Karaites are now; that is, they would not receive the traditions of the elders, but stuck to the written word only; and, the Pharisees being great promoters of those traditions, these two sects became opponents. Afterwards the Sadducees imbibed other doctrines, they denied the resurrection of the dead, and the existence of angels, and of the spirits or souls of men departed. (Matt. xxii. 23, Acts xxiii. 8). They held that there is no spiritual being but God only; that as to man, this world is his all. They did not deny but that we had reasonable souls; but they maintained that these were mortal; and that what is said of the existence of angels, and of a future resurrection, is nothing but illusion. It is also said that they rejected the prophecies. The Sadducees observed the law themselves, and caused it to be observed by others with the utmost rigor. They admitted of

none of the traditions, explications, or modifications of the Pharisees; they kept only to the text of the law; and maintained that only what was written was to be observed. The Sadducees are accused of rejecting all the books of Scripture except those of Moses. But Scaliger vindicates them from this reproach, and observes that they did not appear in Israel till after the canon was completed; and that, if they had been to come out of the canonical Scriptures, the Pentateuch was less favorable to them than any other book, since it often mentions angels. Besides, the Sadducees were present in the temple, where the books of the prophets were daily read, and were in the chief employments of the nation; many of them were even priests. Menasseh Ben Israel says, expressly, that they did not reject the prophets, but that they explained them in a sense very different from that of the other Jews. Josephus assures us that they denied destiny or fate; alleging that these were only sounds void of sense, and that all the good or evil that happens to us is in consequence of the good or evil side we have taken, by the free choice of our will. They said, also, that God was far removed from doing or knowing evil, and that man was the absolute master of his own actions. Yet it is certain they were not only tolerated among the Jews, but were admitted to the high priesthood itself. John Hyrcanus, high priest, separated from the Pharisees, and went over to this sect; and gave strict command to the Jews, on pain of death, to receive the maxims of this sect. Aristobulus and Alexander Jannæus, sons of Hyrcanus, favored the Sadducees; and Maimonides assures us that under Alexander Jannæus they possessed all the offices of the Sanhedrim, and that there only remained of the party of the Pharisees Simon the son of Secra. Caiaphas, who condemned Jesus Christ, was a Sadducee, as well as Ananus the younger, who put to death St. James. The modern Jews hold as heretics that small number of Sadducees that are among them. The sect of the Sadducees was much reduced by the destruction of Jerusalem, and by the dispersion of the Jews; but it revived afterwards. At the beginning of the third century it was so formidable in Egypt that Ammonius wrote against them, or rather against the Jews, who tolerated the Sadducees, though they denied the fundamental points of their religion. The emperor Justinian mentions the Sadducees in one of his acts, banishes them out of his dominions, and condemns them to the severest punishment, as people that maintained atheistical and impious tenets. Ananus, or Ananus, a disciple of Juda, son of Nachman, a famous rabbi of the eighth century, declared himself in favor of the Sadducees, and strenuously defended them; as did also, in the twelfth century, Alpharag, a Spanish rabbi. This doctor wrote against the Pharisees, and maintained that the purity of Judaism was only to be found among the Sadducees; that the traditions avowed by the Pharisees were useless; and that the ceremonies, which they had multiplied without end, were an insupportable yoke.

SADLER (Anthony), D. D., an eminent English divine: born at Chilton, in Wiltshire,

in 1610. He took his degree in 1665, and was appointed one of the king's chaplains by Charles II. He died in 1680.

SADLER (William Windham), an ingenious aeronaut, who fell a victim to the practice of his profession. On the 30th of September, 1824, he ascended from the neighbourhood of Blackburn in Lancashire; and in the descent, the car being driven against a chimney, Mr. Sadler was thrown out, at the height of about forty yards from the ground, when his skull was fractured, and he was otherwise so injured as to occasion his death, in the twenty-eighth year of his age. He had made thirty aerial voyages, in one of which he crossed the Irish channel, ascending at Dublin and alighting on the Welsh coast, and possessed considerable talents as a chemist and engineer, in which capacities he was employed by the first gas company established at Liverpool, where he had also fitted up warm, medicated, and vapor baths.

SADOLET (James), a learned cardinal, born at Modena in 1477. Leo X. made him his secretary. Sadolet was soon after made bishop of Carpentras, near Avignon. He was made a cardinal in 1536, by Paul III., and employed in several negotiations and embassies. He died in 1547, not without the suspicion of poison, for corresponding too familiarly with the Protestants, and for testifying too much regard for some of their doctors. His works, which are in Latin, were collected in 1607 at Mentz, in 1 vol. 8vo. All his contemporaries spoke of him in the highest terms.

SADYATTES, the son of Gyges, king of Lydia, father of Alyattes II., and grandfather of the famous Croesus. He succeeded Ardysus II. about A. C. 631; carried on a war against the Milesians for six years, and died in 619, in his thirteenth year.

SAFE, *adj.* & *n. s.*

SAFE-CONDUCT, *n. s.*

SAFE-GUARD, *n. s.* & *v. n.*

SAFE'LY, *adv.*

SAFE'NESS, *n. s.*

SAFETY.

food; a safe-conduct is, a pass or warrant to pass; a convoy : safeguard, protection; defence; pass; and, as a verb neuter, to protect: safely and safeness follow the senses of safe. adjective: safety is, security; freedom or preservation from hurt; custody.

To write the same things to you, to me is not grievous, but to you *safe*. *Phil.* iii. 1.

We serve the living God as near as our wits can reach to the knowledge thereof, even according to his own will; and do therefore trust that his mercy shall be our *safeguard*. *Hooker*.

Our separated fortune
Shall keep us both the *safer*; where we are,
There's daggers in men's smiles.

Shakespeare. Macbeth.

But Banquo's *safe*?
—Ay, my good lord. *Safe* in a ditch he bides,
With twenty trenched gashes on his head;
The least a death to nature. *Id.*

If you do fight in *safeguard* of your wives,
Your wives shall welcome home the conquerors.

Shakespeare.
God *safely* quit her of her burden, and with gentle
Q ?

travail, to the gladding of your highness with an heir. *Id.*

To that dauntless temper of his mind,
He hath a wisdom that doth guide his valour
To act in *safety*. *Id.*

Imprison him;
Deliver him to *safety*, and return. *Id. King John.*

Cæsar, where dangers threatened on the one side,
and the opinion that there should be in him little *safeguard* for his friends on the other, chose rather to venture upon extremities, than to be thought a weak protector. *Laligh.*

A trumpet was sent to sir William Waller, to desire a *safe-conduct* for a gentleman. *Clarendon.*

A trumpet was sent to the earl of Essex for a *safeguard* or pass to two lords, to deliver a message from the king to the two houses. *Id.*

Ascend; I follow thee, *safe guide*, the path
Thou leadest me. *Milton.*

But 'Trivia kept' in secret shades alone,
Her care, Hippolytus, to fate unknown;
And called him Virbins in the Egerian grove,
Where then he lived obscure, but *safe* from Jove. *Druden.*

Pot your head into the mouth of a wolf, and, when you've brought it out *safe* and sound, talk of a reward. *L'Estrange.*

Who is there that hath the leisure and means to collect all the proofs, concerning most of the opinions he has, so as *safely* to conclude that he hath a clear and full view? *Locke.*

If a man should forbear his food or his business, till he had certainty of the *safeness* of what he was going about, he must starve and die disputing. *Smith.*

If her acts have been directed well,
While with her friendly clay she deigned to dwell,
Shall she with *safety* reach her pristine seat,
Find her rest endless, and her bliss complete? *Prior.*

Great numbers, descended from them, have, by the blessing of God upon their industry, raised themselves so high in the world as to become, in times of difficulty, a protection and a *safeguard* to that altar, at which their ancestors ministered. *Atterbury.*

Thy sword, the *safeguard* of thy brother's throne,
Is now become the bulwark of thy own. *Granville.*

Beyond the beating surge his course he bore,
With longing eyes observing to survey
Some smooth ascent, or *safe* sequestered bay. *Pope.*

SAFETY-CONDUCT is a security given by a prince under the great seal, to a stranger, for his safe coming into and passing out of the realm. There are letters of safe-conduct which must be enrolled in chancery; and the persons to whom they may be granted must have them ready to show.

SAFETY LAMP. For a description of this humane and useful invention see **LAMP** and **COAL**. One inconvenience attached to this lamp was, that the perfect safety which attended its use often induced the men at work in the mines to go into more deteriorated atmospheres than they otherwise would, which sometimes occasioned the lights to be extinguished. To obviate this inconvenience, Sir Humphrey Davy has contrived to suspend a coil of platinum wire over the flame of each lamp, the effect of which is, that the moment the light is extinguished by the superabundance of carbureted hydrogen gas in the atmosphere, the coil of platinum wire becomes of an intense red heat; and this affords light enough to enable the men to find the road through the different passages to

the entrance of the mine. This alone would have been an important improvement—but this is not all; for no sooner is the lamp brought into a part of the mine in which the atmosphere contains less than one-fourth of carbureted hydrogen gas, than the heated platinum wire of itself re-lights the lamp, and the men are enabled to return to their work without further interruption and in perfect safety.

Mr. Murray's new safety lamp, presented in the annexed diagram, consists of two concentric cylinders of thick glass, the space between being filled with water through a pipe at top, and represented in the figure, having an air-escape aperture on the opposite side. 'Over the flame of the wick,' says Mr. M., 'is a bell or funnel, with a double recurved pipe issuing from its summit, and passing below the lamp, terminating immediately under a single central aperture. Here the products of combustion are discharged (the excess is of course disengaged by the usual aperture at the top of the cylinder), and mingled with the explosive atmosphere rising from below, and passing to the flame of the lamp. This is again mixed more intimately at its immediate ingress, where it passes through the apertures represented on each side of the lamp. The rest may be inferred from a simple inspection of the figure, in which two of the ribs that fence in the outer cylinder (a guard from external injury) are supposed to be removed, in order to show the internal arrangement to better advantage.

'By a circular band of lead affixed to its base, the instrument will always fall vertically; and, should it accidentally fall on its side, it will immediately recover its upright position. The water will not spill in any condition of the instrument, for the resistance of the atmosphere will prevent this. It is shown lower in the cylinders than it ought to be, in order to be clearly represented. The water will preserve the inner cylinder of an equable temperature. Hedged in by water, external injury may only affect the outer wall; but, granting that the instrument is crushed to atoms in an explosive atmosphere, the worst that can happen is the extinction of the flame within by a flood of water.'

'I see,' continues the inventor, 'no necessity for shielding the inner cylinder by metallic bars, because explosion cannot take place within. The lamp is a self regulator; for, as the quantity of azote, &c., will be in the ratio of the quantity of the disarmed explosive mixture, and consequent elongation of the spire of flame, so soon as it amounts to a maximum, extinction takes place, and the comparative color of the flame, with the varied phenomena of the exotic lambent flame, will afford an elegant measure of that explosive force which has been disarmed before its transmission from the portal below.

'This lamp has been submitted to the ordeal

of explosive atmospheres, with the most complete success. No explosion whatever occurs within the cylinder. When the explosive atmosphere, mixed with the product of combustion, passes towards the lamp, the color of its flame is changed, and it shoots up into the bell or funnel (which carries off these chemical products of flame, in order that they may be mixed with the explosive atmosphere, before it passes into the cylinder); and, as the explosive mixture increases, a lambent attenuated flame plays silently round that of the lamp, which finally disappears; and, when it has reached its maximum, it is tranquilly extinguished.

SAFFI, or AZAFFI, a sea-port of Morocco, the capital of the province of Abda. It is supposed to be a town originally built by the Carthaginians, and is situated between two hills. Here is a very fine road, affording anchorage in every season, except in winter, when the winds blow from the south and south-west. The French had several factories there, where they took in great quantities of wool, wax, gum, and leather; but the emperor, having founded Mogodor, gave it the monopoly of the trade with Europe. The country round consists of a dry and barren sand, and the Moors are very rude and fanatical here. The population is stated by Jackson at 12,000. Long. $9^{\circ} 5' W.$, lat. $32^{\circ} 26' N.$

SAFFRON, *n. s.* Fr. *safran*; from Arab. *saphar*; Span. *azafran*. A plant.

Are these your customers?

Did this companion, with the *saffron* face,

Revel and feast it at my house to-day,

Whilst upon me the guilty doors were shut?

Shakspeare.

Soon as the white and red mixt finger'd dame

Had gilt the mountains with her *saffron* flame,

I sent my men to Circe's house.

Chapman's Odyssey.

Grind your bole and chalk, and five or six chives
of *saffron*.

Peucham.

Now when the rosy morn began to rise,

And waved her *saffron* streamer through the skies.

Dryden.

An herb they call safflow, or bastard *saffron*, dyers
use for scarlet.

Mortimer's Husbandry.

SAFFRON, in botany. See CROCUS. Saffron is principally cultivated in Cambridgeshire, and near Saffron Walden in Essex; but the quantity of land under this crop has been gradually lessening for the last century, and especially within the last fifty years, so that its culture is now almost entirely confined to a few parishes round Saffron Walden. This is owing partly to the material being less in use than formerly, and partly to the large importations from the east, often, as professor Martyn observes, adulterated with bastard saffron (*carthamus tinctorius*) and marygolds.

Saffron is generally planted upon fallow ground, and they prefer that which has borne barley the year before. The saffron ground is seldom above three acres; and, in choosing, the principal thing is, that it be well exposed, the soil not poor, nor a very stiff clay, but a temperate dry mould, such as commonly lies upon chalk, and is of a hazel color. The ground being chosen, about Lady-day or the beginning of April it must be carefully ploughed, the furrows

being drawn much closer together, and deeper, if the soil will allow, than is done for any kind of corn; and accordingly the charge is greater. About five weeks after, during any time in May, they lay between twenty and thirty loads of dung upon each acre; and, having spread it with great care, they plough it in as before. The shortest rotten dung is the best; and the farmers spare no pains to make it good, being sure of a proportionable return. About midsummer they plough a third time, and between every sixteen feet and a half they leave a broad furrow, which serves both as a boundary to the several parcels, and for throwing the weeds into at the proper season. The time of planting is commonly in July. The only instrument used at this time is a small narrow spade, commonly called a spit shovel.

One man with his shovel raises about three or four inches of earth, and throws it before him about six or more inches. Two persons, generally women, follow with roots, which they place in the farthest edge of the trench made by the digger, at about three inches from each other. As soon as the digger has gone once the breadth of the ridge, he begins again at the other side; and, digging as before, covers the roots last set, which makes room for another row of roots at the same distance from the first. The only dexterity necessary in digging is to leave some part of the first stratum of earth untouched to lie under the roots; and, in setting, to place the roots directly upon their bottom. The quantity of roots planted on an acre is generally about sixteen quarters, or 128 bushels. From the time of planting till September, or sometimes later, there is no more labor required; but at that time they begin to vegetate, and are ready to show themselves above ground, which may be known by digging up a few of the roots. The ground is then to be pared with a sharp hoe, and the weeds raked into the furrows, otherwise they would hinder the growth of the saffron. In some time after the flowers appear. They are gathered before they are full blown, as well as after; and the proper time for it is early in the morning. The owners of the saffron fields get together a sufficient number of hands, who pull off the whole flowers, and throw them by handfuls into a basket, and so continue till about 11 o'clock. Having then carried home the flowers, they immediately fall to picking out the stigmata or chives, and together with them a pretty large proportion of the stylus itself; the rest of the flower they throw away. Next morning they return to the field, without regarding whether the weather be wet or dry; and so on daily, till the whole crop is gathered.—The next labor is to dry the chives on the kiln. The kiln is built upon a thick plank, that it may be moved from place to place. It is supported by four short legs; the outside consists of eight pieces of wood of three inches thick, in form of a quadrangular frame, about twelve inches square at the bottom on the inside, and twenty-two on the upper part; which last is likewise the perpendicular height of it. On the foreside is left a hole of about eight inches square, and four inches above the plank, through which the fire is put in; over all

the rest laths are laid pretty thick, close to one another, and nailed to the frame. They are then plastered over on both sides, as are also the planks at bottom, very thick, to serve for a hearth. Over the mouth is laid a hair-cloth, fixed to the edges of the kiln, and likewise two rollers or moveable pieces of wood, which are turned by wedges or screws, to stretch the cloth. Instead of the hair-cloth, some people use a network of iron wire, by which the saffron is sooner dried, and with less fuel; but the difficulty of preserving it from burning makes the hair-cloth preferred by the best judges. The kiln is placed in a light part of the house; and they begin with putting five or six sheets of white paper on the hair-cloth, and upon these they lay out the wet saffron two or three inches thick. It is then covered with some other sheets of paper, and over these is laid a coarse blanket five or six times doubled, or, instead of this, a canvas pillow filled with straw; and, after the fire has been lighted for some time, the whole is covered with a board having a considerable weight upon it. At first they apply a pretty strong heat; and at this time a great deal of care is necessary to prevent burning. When it has been thus dried about an hour they turn the cakes of saffron upside down, putting on the coverings and weight as before. If no accident happens during these first two hours the danger is over; and nothing more is requisite but to keep up a very gentle fire for twenty-four hours, turning the cake every half hour. That fuel is best which yields least smoke; for which reason charcoal is preferred. The quantity of saffron produced at a crop is uncertain. Sometimes five or six pounds of wet clives are got from one rood, sometimes not above one or two, and so sometimes not so much as is sufficient to defray the expense of gathering and drying. But it is always observed that about five pounds of wet saffron go to make one pound of dry for the first three weeks of the crop, and six pounds during the last week. When the heads are planted very thick two pounds of dry saffron may at a medium be allowed to an acre for the first crop, and twenty-four pounds for the two remaining ones, the third being considerably larger than the second. To obtain the second and third crops the hoeing, gathering, picking, &c., must be repeated; and about midsummer, after the third crop is gathered, the roots must all be taken up and transplanted. For taking up the roots sometimes the plough is used, and sometimes a forked hoe; and then the ground is harrowed once or twice over. During all the time of ploughing, harrowing, &c., fifteen or more people will find work enough to follow and gather the heads as they are turned up. The roots are next to be carried to the house in sacks, where they are cleaned thoroughly from earth, decayed old pieces, involucra, or excrescences, after which they become fit to be planted in new ground, or they may be kept for some time without danger of spoiling. At a medium, twenty-four quarters of clean roots, fit to be planted, may be had from each acre.

In purchasing saffron that kind ought to be chosen which has the broadest blades; this being the mark by which English saffron is distin-

guished from the foreign. It ought to be of an orange or fiery red color, and to yield a dark yellow tincture. It should be chosen fresh, not above a year old, in close cakes, neither dry nor yet very moist, tough and firm in tearing, of the same color within as without, and of a strong, acid, diffusive smell.

SAFFRON, the *κροκος* of the Greeks, *crocus* of the Latins, and *zaffran*, or *zahafaran* of the Arabians, was held in much estimation by the Hebrews, who called it *carcom*, and was greatly celebrated in ancient times both by physicians and poets. In medicine it was considered to be very powerful, but it is not now much used. Saffron imparts the whole of its virtues and color to rectified spirit, proof spirit, wine, vinegar, and water. A tincture drawn with vinegar loses greatly its color in keeping; the watery and vinous tinctures are apt to grow sour, and then lose their color also; that made in pure spirit keeps in perfection for many years.

SAFFRON, BASTARD. See *CARHAMUS*.

SAFFRON, MEADOW. See *COLCHICUM*.

SAFFRON WALDEN, a market-town and parish of Essex, twelve miles north from Bishop's Stortford, and forty-two north-east from London. The church is a fine old Gothic building, and there are Presbyterian, Baptist, and Quakers' meeting-houses, with several well-endowed almshouses, and a free-school. A considerable trade is carried on in malting, and in the manufacture of bolting-cloths, checks, fustians, &c. The town is irregularly built and not paved. It was incorporated by Edward VI., and is governed by a mayor and aldermen. The keep of its ancient castle is still to be seen, and on the green behind it is a singular work, called the Maze, consisting of a number of concentric circles, with four outworks issuing from the four sides, all cut in the chalk, and supposed by Dr. Stukely to have been a British place of exercise for the soldiery. Audley-End, the seat of lord Braybrooke, stands on the site of a priory of Benedictines, and was once a royal palace of great magnificence and extent, but part of it has been pulled down. Market on Saturday.

SAG, *v. n.* Goth. and Swed. *sigá*. To hang heavy.

The mind I say by, and the heart I bear,
Shall never *sag* with doubt, nor shake with fear.

Shakspeare.

SAGA'CIOUS, *adj.* } Lat. *sagax*. Quick
SAGA'CIOUSLY, *adv.* } of scent or thought,
SAGA'CIOUSNESS, *n. s.* } with *of*: the adverb
SAGA'CITY. } and noun substantives

corresponding.

So scented the grim feature, and up turned
His nostrils wide into the murky air;

Sagacious of his quarry from so far.

Milton.

With might and main they chased the murtherous
fox,

Nor wanted horns t' inspire *sagacious* hounds.

Dryden.

Only *sagacious* heads light on these observations,
and reduce them into general propositions. *Locke*.

Sagacity finds out the intermediate ideas, to discover what connection there is in each link of the chain, whereby the extremes are held together. *Id.*

It requires too great a *sagacity* for vulgar minds to draw the line nicely between virtue and vice. *South*.

SAGAN, in Scripture history, the suffragan or deputy of the Jewish high-priest. According to some writers, he was only to officiate for him when he was rendered incapable of attending the service through sickness or legal uncleanness on the day of expiation; or, according to others, he was to assist the high-priest in the care of the affairs of the temple and the service of the priests.

SAGAPENUM, in pharmacy, &c., a gum-resin brought to us in two forms; the finer and purer is in loose granules or single drops; the coarser kind is in masses composed of these drops of various sizes cemented together. In either case it is of a firm and compact substance, considerably heavy, and of a reddish color on the outside, brownish within, and spotted in many places with small yellowish or whitish specks. Its smell is strong and disagreeable; its taste acrid and unpleasant. It is imported from Persia and the East Indies. The plant which produces it is supposed to be of the ferula kind, from the seeds and fragments of the stalks sometimes met with in the body of it. Its dose is from ten grains to two scruples; but it is now seldom given alone. It is an ingredient in the theriaca, mithridate, and many other compositions of the shops.

SAGARA, the ancient Helicon of Greece, stands a few miles to the north of the gulf of Corinth. It is of considerable height, and its scenery is picturesque. Here may still be traced the fountains of Aganippe and Hippocrene, the stream of Permessus, and the village of Ascrea, the birth-place of Hesiod, now also called, after the mountain, Sagara. From its top may be seen a great part of Greece.

SAGE, *adj. & n. s.* } *Fr. sage*; *Ital. saggio*;
SAGE'LY, *adv.* } *Lat. sagax*. Wise; grave;
SAGE'LINESS, *n. s.* } prudent: a man of gravity or wisdom: the adverb and noun substantive corresponding.

Though you profess
 Yourselves such *sages*; yet know I no less,
 Nor am to you inferior. *Sundys.*

Tired limbs to rest,
 O matron *sage*, quoth she, I hither came. *Faerie Queene.*

Vane, young in years, but in *sage* councils old,
 Than whom a better senator ne'er held *Milton.*

At his birth a star proclaimed him come,
 And guides the eastern *sages*, who enquire
 His place, to offer incense, myrrh, and gold. *Id.*

Can you expect that she should be so *sage*
 To rule her blood, and you not rule your rage? *Waller.*

Groves, where immortal *sages* taught,
 Where heav'nly visions Plato fired. *Pope.*

I grant it dangerous, and approve your fear,
 That fire is catching if you draw too near;
 But *sage* observers oft mistake the flame,
 And give true piety that odious name. *Couper.*

SAGE, *n. s.* *Fr. sauge*; *Lat. salvia*. A plant of which the school of Salernum thought so highly that they left this verse:—

Cur moriatur homo cui *salvia* crescit in horto?
Johnson.
 By the color, figure, taste, and smell, we have
 as clear ideas of *sage* and hemlock, as we have of a
 circle *Locke.*

Marbled with *sage* the hard'ning cheese she pressed.
Gay.

SAGE, in botany. See **SALVIA**.

SAGE TREE. See **PHILOMIS**.

SAGE (Alan René Le), a celebrated French writer, born at Ruys, in Brittany, in 1667. He was a complete master of the French and Spanish languages, and wrote several admired novels in imitation of the Spanish authors. These were, *The Bachelor of Salamanca*, 2 vols. 12mo.; *New adventures of Don Quixote*, 2 vols. 12mo.; *The Devil on Two Sticks*, 2 vols. 12mo.; and *Gil Blas*, 4 vols. 12mo. He produced also some comedies, and died in 1747, near Paris.

SAGHALIEN, called also *Oku Jesso*, the Upper Jesso, and by the natives *Tchoka*, a large island at the eastern extremity of Asia, immediately to the north of the island of Jesso. It is about 450 miles in length from north to south, and from forty to 130 in breadth from east to west, separated from the continent by a narrow channel, called the channel of Tartary. It has become a subject of controversy among navigators whether this channel extends along the whole western coast, thus forming Saghalien into an island, or whether there be an isthmus connecting it with Tartary, rendering it a peninsula. D'Anville, in his maps, describes it sometimes one way and sometimes the other; and though Peyrouse entered the channel, he was obliged, by adverse winds, to quit it before examining its whole extent. On enquiring of the people of Saghalien itself, he was assured that it was an island, separated from the continent only by a narrow strait. The people of Tartary, on the other hand, asserted that Saghalien was connected with the continent by an isthmus of sand. Peyrouse, on the whole, was led to conclude that there was a strait, but so obstructed by sand and sea-weed as to be scarcely passable. Some geographers are of opinion that all the circumstances may be best accounted for, by supposing a very narrow and winding strait separating the two coasts. This is the delineation followed in the Chinese and Japanese maps.

Saghalien, late Jesso, appears to be very mountainous towards the centre, and on the eastern coast. To the south of 51° the country becomes more level, and exhibits only sand-hills. Here the soil exhibits a vigorous vegetation, and is covered with forests of pine, oak, willow, and birch. The surrounding sea and the rivers produce an extraordinary quantity of fish. Roses, angelica, and other flowers, flourish on the hills. The eastern coast, along which the Russian navigator Krusenstern sailed, appeared to be nearly destitute of inhabitants. Peyrouse gives a very favorable account of those with whom he had intercourse. They sail in boats of willow bark, similar to those made on the neighbouring island of Jesso. The north-east coast, opposite to the mouth of the Saghalien, is occupied by a colony of Mantehou Tartars. The Japanese had formed a colony in the bay of Aniwa, at the southern extremity of the island; but it has been destroyed by the Russians.

SAGINA, in botany, pearl-wort, a genus of the tetragynia order, and tetrandria class of plants; natural order twenty-second, caryophyllææ: *CAL. te-*

traphyllous; petals four: CAPS. unilocular, quadrivalved, and polyspermous. Species five, four common in our own country.

SAGITTA, in astronomy, the arrow or dart, a constellation of the northern hemisphere, near the eagle. See **ASTRONOMY**.

SAGITTAL, *adj.* & *n. s.* } Lat. *sagitta*, an arrow. Belonging to an arrow: in anatomy, a suture so called from its resemblance to an arrow: sagittary is the fabled CENTAUR, which see.

His wound was between the *sagittal* and coronal sutures to the bone. *Wiseman's Surgery.*

The dreadful *sagittary*

Appeals our numbers.

Shakespeare, Troilus and Cressida.

SAGITTARIA, arrow head, a genus of the polyandria order, and monœcia class of plants; natural order fifth, tripetaloidæ: MALE CAL. triphyllous: COR. tripetalous; the filaments generally about fourteen: FEMALE CAL. triphyllous: COR. tripetalous; pistils many: SEEDS many and naked. Species five, of which the most remarkable is the

S. sagittifolia, growing naturally in many parts of England. The root is composed of many strong fibres, which strike into the mud; the foot-stalks of the leaves are in length proportionable to the depth of the water in which they grow; sometimes almost a yard long; they are thick and fungous; the leaves, which float upon the water, are shaped like the point of an arrow, the two ears at their base spreading wide asunder. The flowers are produced upon long stalks which rise above the leaves, standing in whorls round them at the joints. They consist of three broad white petals, with a cluster of stamina in the middle, which have purple summits. There is always a bulb at the lower part of the root, growing in the solid earth beneath the mud. This bulb constitutes a considerable part of the food of the Chinese; and upon that account they cultivate it. Horses, goats, and swine, eat it; cows are not fond of it.

SAGITTARIUS, the archer, in astronomy, the ninth sign in the zodiac, marked thus ♐. The stars in this constellation are in the Britannic Catalogue fifty-two, in Tycho Brahe's sixteen, and in Ptolemy's thirty-two.

SAGO is a simple brought from the East Indies, of considerable use as a restorative diet. It is produced from a species of palm tree, growing in the East Indies. The progress of its vegetation in the early stages is very slow. At first it is a mere shrub, thick set with thorns; but, as soon as its stem is once formed, it rises in a short time to thirty feet, is about six feet in circumference, and imperceptibly loses its thorns. Its ligneous bark is about an inch in thickness, and covers a multitude of long fibres; which, being interwoven one with another, envelope a mass of a gummy kind of meal. As soon as this tree is ripe, a whitish dust, which transpires through the pores of the leaves, and adheres to their extremities, proclaims its maturity. The Malays then cut it down near the root, divide it into several sections, and then scoop out the mass of mealy substance, which is enveloped by, and adheres to the fibres; they dilute it in water, and

then pass it through a straining bag of fine cloth, to separate it from the fibres. When this paste has lost part of its moisture, by evaporation, the Malays throw it into earthen vessels, of different shapes, where they allow it to dry and harden. This paste is wholesome nourishing food; the Indians eat it diluted with water, and sometimes baked or boiled. A jelly is sometimes made of it, which is white and of a delicious flavor. An inferior kind of sago is made in the West Indies from the pith of the areca.

SAGOR, an island of Bengal, from time immemorial a celebrated place of Hindoo pilgrimage. It is situated at the junction of the Bhaguratty River, the most sacred branch of the Ganges, with the ocean. Till recently many persons annually devoted themselves, and sacrificed their children at this place, to the sharks and alligators. The island is not inhabited, but the Brahmins repair at the appointed season to the temple, followed by the pilgrims. A society in Calcutta has lately taken a lease of this island from the East India Company, and engaged to clear and bring it into a state of cultivation. Its south point is in long. 88° 20' E., lat. 21° 34' N.

SAGREDO (John), a noble Venetian, of an ancient family, who flourished in the seventeenth century. He became procurator of St. Mark, and was elected doge of Venice in 1675; but resigned because his election was not approved by the people. He was sent ambassador to several European courts. In 1677 he published a History of the Ottoman Empire; which is esteemed a very faithful compilation.

SAGUENAY, a river of Canada, tributary to the St. Lawrence, into which it flows, on the west bank, at the town and harbour of Tadousac. It draws its source from Lake St. John, receiving many large rivers that flow from the north and north-west, from an immense distance in the interior.

SAGUM, in Roman antiquity, a military habit, open from top to bottom, and usually fastened on the right shoulder with a buckle or clasp. It was not different in shape from the chlamys of the Greeks and the paludamentum of the generals. The only difference between them was, that the paludamentum was made of a richer stuff, was generally of a purple color, and rather longer and fuller than the sagum. Some authors have defined the sagum as a military tunic, but several passages of Tacitus and Pliny show that it was without sleeves, and was more ample than the tunic. The emperor Caracalla had invented, or imitated from the Gauls, a particular kind of sagum, to which the emperor's name was assigned; and so fond is he represented to have been of this garment that he preferred it to any other, distributed a large number among the people and soldiers, and even required that all who approached his presence should wear this vestment.

The precise form of the Caracalla is not now to be ascertained. It has been described as a garment made of several pieces diversely embroidered, and descending to the heels, excepting in the instance of the soldiers who wore it shorter.

SAGUNTUM, or **SAGUNTUS**, an ancient town of Spain, now called **Morvedro**, where there are still the ruins of a Roman amphitheatre. **Saguntum** is celebrated in history as having been the cause of the second Punic war, and for its attachment to the Romans. Hannibal took it after a siege of about eight months; and the inhabitants, not to fall into the enemy's hands, set fire to their houses, and all their effects, and perished in the flames. The conqueror afterwards rebuilt it, and, as some suppose, called it **Spartagene**.

SAHARA, a name, sometimes given to the great African desert, or the immense tract of territory in Northern and Central Africa, interposed between the states of Barbary and Soudan. In its greatest length it stretches nearly across the whole of Africa, from the Atlantic to the Nile, forming a space of 45° of long., or about 3000 miles. Its breadth from Barbary to Soudan may be estimated at 15°, or 1000 miles. It forms thus by much the most extensive desert to be found in any part of the world, and has already been treated of under the article **AFRICA**. The only impulse by which man has been led to traverse these dreary wilds is that of commerce; and the chief means for this have been afforded by that most useful animal the camel. The ordinary trade is carried on by merchants, inured from their infancy to that train of hardship and difficulty which attends these journeys, and who, for the sake of mutual aid, proceed in caravans or large bodies, sometimes amounting to the number of 2000. Their food consists of the milk of the camel, with barley-meal or Indian corn, a few dates, or dried flesh and coffee. Water is conveyed in goat-skins covered with tar. At each of the oases, or spots affording water, which occur at distant intervals along the waste, they stop for a few days to take in a supply. The greatest evil which they have to fear is when, in consequence of a peculiarly dry season, one of these happens to fail of water. A caravan from Morocco, consisting of 2000 men, with 1800 camels, entirely perished in this way in 1793. The caravans take their departure from every part of Northern Africa; but the three grand points of rendezvous are Cairo, Mourzouk, and the south frontier of Morocco. Cairo sends three great caravans into the interior; one to Sennaar, partly along the Nile, but chiefly across the deserts on either side; another proceeds to Darfur, through an extensive desert, by the Great Oasis, Sheb, and Selyme. It sends one also to Mourzouk, which communicates with those despatched thence in the countries on the Niger. Mourzouk sends two great caravans, one to Bornou, and one to Cassina, and holds intercourse with Tombuctoo on a smaller scale.

The sea coast of the Sahara is for the most part rocky and destitute of harbours. Hence a considerable number of European vessels suffer shipwreck, and are cast ashore here; when the crews are generally stripped of every thing, and reduced to a state of cruel bondage. Their only hope of relief is from being carried over the desert to be sold in Morocco, whence European merchants frequently send them home.

SAID, or **SAHM**, a name applied to Upper

Egypt, comprehending the valley of the Nile, from the vicinity of Cairo to the frontier of Nubia. It consists throughout of a plain only a few miles broad, enclosed between the chains of mountains which extend parallel with the Nile, and is exceedingly fertile, particularly in grain, and in antiquities.

SAIDA, the port of Damascus, the ancient **SIDON**, see that article.

SAIL, *n. s.*, *v. n.* & *v. a.* } *Sax.* *regl*; *Belg.*
SAILER, or } *seyhel*, *seyl*; *Swed.*
SAILOR, *n. s.* } *segel*. The canvas sheet which catches the wind and carries on a vessel; a ship or vessel; wings; any number of ships: to sail is, to move by means of sails; put out to sea; pass by sailing: a sailer, a seaman.

Fearing lest they should fall into the quicksands, they strake *sail*, and so were driven. *Acts* xxvii. 17.
 When *sailing* was now dangerous, Paul admonished them. *Acts*.

He cutting way
 With his broad *sails* about him soared round;
 At last, low stooping with unwieldy sway,
 Snatched up both horse and man. *Færie Queene*.
 He came too late; the ship was under *sail*.

Shakspeare.
 So by a roaring tempest on the flood,
 A whole armada of collected *sail*
 Is scattered.

Speak again, bright angel! for thou art
 As glorious to this sight, being o'er my head,
 As is a winged messenger from heaven,
 When he bestrides the lazy-pacing clouds,
 And *sails* upon the bosom of the air. *Id*.
 It is written of Edgar, that he increased the fleet
 he found to two thousand six hundred *sail*.

Raleigh's Essays.
 They had many times men of other countries that
 were no *sailors*. *Bacon*.

A feigned tear destroys us, against whom
 Tydides nor Achilles could prevail,
 Nor ten years' conflict, nor a thousand *sail*.
Denham.

The galley borne from view by rising gales,
 She followed with her sight and flying *sails*.
Dryden.

Battered by his lee they lay;
 The passing winds through their torn canvas play,
 And flagging sails on heartless *sailors* fall. *Id*.
 I shall not mention any thing of the *sailing* wag-
 gons. *Mortimer*.

View Alcinoüs' groves, from whence
Sailing the spaces of the boundless deep,
 To Ariconium precious fruits arrived. *Philips*.

A *sail* arrived
 From Pompey's son, who through the realms of
 Spain
 Calls out for vengeance on his father's death.

Addison's Cato.
 He had promised to his army, who were discour-
 aged at the sight of Seleucus's fleet, consisting of
 an hundred *sail*, that at the end of the summer they
 should see a fleet of his of five hundred *sail*.

Arbutnot on Coins.
 Young Pompey built a fleet of large ships, and
 had good *sailors*, commanded by experienced captains.
Arbutnot.

Sublime she *sails*
 Th' aerial space, and mounts the winged gales.
Pope.

Full in the openings of the spacious main
 It rides, and, lo! descends the *sailer* train.
Id. Odysseus.

A *SAIL*, in navigation, is an assemblage of several breadths of canvas sewed together by the lists, and edged round with cord, fastened to the yards of a ship, to make it drive before the wind. See *SHIPPING*. The edges of the cloths, or pieces, of which a sail is composed, are generally sewed together with a double seam; and the whole is skirted round at the edges with a cord, called the bolt-rope. Although the form of sails is extremely different, they are all nevertheless triangular or quadrilateral figures. The former of these are sometimes spread by a yard, as lateen-sails; and otherwise by a stay, as stay-sails; or by a mast, as shoulder-of-mutton sails; in all which cases the foremost leech or edge is attached to the said yard, mast, or stay, throughout its whole length. The latter, or those which are four-sided, are either extended by yards, as the principal sails of a ship; or by yards and booms, as the studding-sails, drivers, and ring-sails; or by gaffs and booms, as the main-sails of sloops and brigantines. The principal sails are the courses, or lower sails, the top-sails, which are next in order above the courses, and the top-gallant sails, which are above the top-sails. Every yard in a ship has its proper sail, except the cross-jack, which takes its name from the yard; and those which are not bent to the yard are the flying jib, fore, foretop, main, maintop, maintop-gallant, mizen, mizentop-mast, stay-sails, main and maintop studding sails. In this important art our law interferes minutely, enjoining by various acts of parliament that every vessel first setting out to sea from Great Britain or British America shall be furnished with one full and complete set of sails of the manufacture of Great Britain, under a penalty of fifty pounds. These acts prescribe the manner in which sail-cloth shall be manufactured as to breadth and width. See *SHIP-BUILDING*.

To make sail is to spread an additional quantity of sail, so as to increase the ship's velocity. To set sail is to unfurl and expand the sails upon their respective yards and stays, in order to begin the action of sailing. To shorten sail, is to reduce or take in part of the sails, with an intention to diminish the ship's velocity. To strike sail is to lower it suddenly. This is particularly used in saluting or doing homage to a superior force, or to one whom the law of nations acknowledges as superior in certain regions. Thus foreign vessels strike to a British man of war in the British seas.

SAILING, the movement by which a vessel is wafted through the water, by the action of the wind upon her sails. When a ship changes her state of rest into that of motion, as in advancing out of a harbour, or from her station at anchor, she acquires her motion very gradually, as a body which arrives not at a certain velocity till after a frequent repetition of the action of its weight. The first impression of the wind greatly affects the velocity, which being but small at first, the resistance of the water which depends on it will be very feeble; but, as the ship increases her motion, the force of the wind on the sails will be diminished; whereas, on the contrary, the resistance of the water on the bow will accumulate in proportion to the velocity with which the

vessel advances. Thus the repetition of the degrees of force, which the action of the sails adds to the motion of the ship, is perpetually increasing; whilst, on the contrary, the new degrees added to the effort of resistance on the bow are always augmenting. The velocity is then accelerated in proportion as the quantity added is greater than that which is subtracted; but when the two powers become equal; when the impression of the wind on the sails has lost so much of its force, as only to act in proportion to the opposite impulse of resistance on the bow, the ship will then acquire no additional velocity, but continue to sail with a constant uniform motion. The great weight of the ship may indeed prevent her from acquiring her greatest velocity; but, when she has attained it, she will advance by her own intrinsic motion, without gaining any new degree of velocity, or lessening what she has acquired. See *TACTICS*, *NAVAL* and *MILITARY*, and *NAVIGATION*.

SAIMA, a large lake, or succession of lakes, in European Russia, in the government of Finland, to the north of Wilmanstrand. It is of very irregular form, said to be 250 miles in length, and of very various breadths. It contains a great number of islands, consisting chiefly of granite, and in general uninhabited. The lake of Lapwesi is a part of that of Saima.

SAINT, *n. s. & v. a.* Fr. *saint*; Lat. *sanc-*
SAINTED, *adj.* *tus*. A person emi-
SAINTLIKE, } nent for piety; to place
SAINTLY, *adv.* } among saints; canonize:
SAINTSHIP, *n. s.* } sainted is holy; pious;
 sacred: saintlike and saintly correspond, as also the noun substantive following.

To thee be worship and thy *saints* for aye.

Shakspeare

She will not stay the siege of loving terms,
 Nor ope her lap to *saint*-seducing gold. *Id.*

I hold you as a thing enskied and *sainted*,
 By your renouncement an immortal spirit,
 And to be talked with in sincerity

As with a *saint*. *Id.*

The king, in whose time it passed, whom catholics count a *saintlike* and immaculate prince, was taken away in the flower of his age. *Bacon.*

He that thinks his *saintship* entitles him to censures is to be looked on not only as a rebel, but an usurper. *Decay of Piety.*

The crown virtue gives,
 After this mortal change, to her true servants,
 Amongst the enthroned gods on *sainted* hills.

Milton.

I mention still
 Him whom thy wrongs, with *saintly* patience borne,
 Made famous in a land and times obscure. *Id.*

If still thou dost retain
 The same ill habits, the same follies too,
 Glossed over only with a *saintlike* show,
 Still thou art bound to vice. *Dryden's Persius.*

This savours something rarer than the tenets of the fifth monarch, and of sovereignty founded upon *saintship*. *South.*

Are not the principles of those wretches still owned, and their persons *sainted*, by a race of men of the same stamp? *Id.*

Miracles are required of all who aspire to this dignity, because they say an hypocrite may imitate a *saint* in all other particulars. *Addison on Italy.*

Over against the church stands a large hospital, erected by a shoemaker, who has been beatified, though never *sainted*. *Addison.*

By thy example, kings are taught to sway,
Heroes to fight, and *saints* may learn to pray.
Granville.

So unaffected, so composed a mind ;
So firm, yet soft, so strong, yet so refined,
Heaven, as its purest gold, by tortures tried ;
The *saint* sustained it, but the woman died. *Pope.*

Thy place is here ; sad sister ; come away :
Once, like thyself, I trembled, wept, and prayed,
Love's victim then, though now a *sainted* maid. *Id.*
The devil was piqued such *sainthood* to behold,
And longed to tempt him. *Id.*

SAINTS (*sancti*), in the Romish church, holy persons deceased, and, since their decease, canonised by the pope, after several informations and ceremonies. One of the points wherein the Roman Catholics and Protestants differ, is, that the former address, invoke, and supplicate saints, &c., to intercede for them ; whereas the latter hold it sufficient to propose their good examples for our imitation. It would seem that in the first ages every bishop in his own diocese was wont to declare what persons were to be honored as saints by his people. Hence St. Cyprian, about the middle of the third century, B. 5. ep. 6, requires that he be informed of those who should die in prison for the faith, that so he might make mention of them in the holy sacrifice with the martyrs, and might honor them afterwards on the anniversary day of their happy death. It was thus that St. Laurence, St. Ambrose, St. Augustine, St. Basil, and many others appear to have been canonised by custom and universal persuasion. In those ages none were reckoned saints but the apostles, the martyrs, and very eminent confessors, whose sanctity was notorious every where. Afterwards canonisations were performed in provincial synods under the direction of the metropolitan. It was thus that St. Isidore of Seville was canonised in the seventh century, by the eighth council of Toledo, fourteen years after his death. This method of canonisation continued occasionally down to the twelfth century. The last instance of a saint canonised in that way is that of St. Walter, abbot of Pontoise, who was declared a saint by the archbishop of Rouen in 1153. In the twelfth century, to prevent mistakes in so delicate a matter, pope Alexander III. judged it proper to reserve this declaration to the holy see of Rome exclusively ; and decreed that no one should for the future be honored by the church as a saint, without the express approbation of the pope. Since that time the canonisation of saints has been carried on in the form of a process ; and there is at Rome a congregation of cardinals, called the congregation of holy rites, who are assisted by several divines under the name of consultants, who examine such matters, and prepare them for the decision of his holiness. When, therefore, any potentate, province, city, or religious body think fit, they apply to the pope for the canonisation of any person. The first juridical step in this business must be taken by the bishop in whose diocese the person for whom the application is made had lived and died, who by his own authority calls witnesses to attest the

holiness, the virtues, and miracles of the person in question. This is succeeded by a tedious process of enquiry into the character of the deceased. Commissioners summon witnesses, take depositions, and collect letters and other writings of the venerable man, and get all the intelligence they can concerning him, and the opinion generally entertained of him. Their report is considered by the congregation, and every part of it discussed by the consultants, when the congregation determines whether or not they can permit the process to go on. If it be allowed to proceed, a cardinal, who is called *ponent*, undertakes to be the principal agent in that affair. There is also a distinguished ecclesiastic called the promoter of the holy faith, who is sworn to make ail reasonable objections to the proofs adduced in favor of the canonisation. If the decision be favorable, then the proofs or miracles are permitted to be brought forward ; when two miracles must be verified to the satisfaction of the congregation, both as to the reality of the facts, and as to their having been above the power of nature. If the decision on this point is likewise favorable, then the whole is laid before the pope and what divines he chooses. When the pope is resolved to give his approbation, he issues a bull, first of beatification, by which the person is declared blessed, and afterwards another of sanctification, by which the name of saint is given him. These bulls are published in St. Peter's church with great solemnity. After his canonisation, his name is inserted in the Martyrology, or catalogue of saints, of which a portion is read every day in the choir at the divine office. His name may be mentioned in the public church service, and his intercession with God besought. His relics may be enshrined, &c. Canonisation is necessarily very expensive, because so many persons must be employed about it ; so many journeys must be made ; so many writings for and against it must be drawn out. The expense altogether amounts to about 25,000 Roman crowns, or £6000 sterling. But it is generally contrived to canonise two or three at a time, by which means the particular expense of each is very much lessened, the solemnity being common. Several authors have written on canonisation, particularly Prosper Lambertini, afterwards pope under the name of Benedict XIV. who had held the office of promoter of the faith for many years. He published on it a large work in several volumes, folio, of which there is an abridgment in French.

St. Joux (Henry), lord Viscount Bolingbroke, an eminent statesman and philosopher, descended from an ancient and noble family, born about the year 1672. He had a liberal education ; and when he left the university, contrary to the inclinations of his family, he cultivated Tory connexions ; and gained such influence in the house of commons that in 1704 he was appointed secretary of war and of the marines. He was closely united in all political measures with Mr. Harley : when, therefore, that gentleman was removed from the seals in 1707, Mr. St. John resigned ; and in 1710, when Mr. Harley was made chancellor of the exchequer, he was made

secretary of state. In 1712 he was created baron St. John of Lediard-Tregoeze in Wiltshire, and Viscount Bolingbroke. But, not receiving when he wished the ribbon of the order of the garter, he renounced the friendship of Harley, then earl of Oxford, and joined with the Whigs. Nevertheless, on the accession of George I., the seals were taken from him; and, hearing that he was to be impeached for his conduct in regard to the treaty of Utrecht, he withdrew to France. Here he accepted an invitation to enter into the pretender's service, and accepted the seals as secretary; but the year 1715 was scarcely expired, when, though he was attainted of high treason at home, the seals and papers of his office were taken from him; the Pretender and his party accusing him of neglect, incapacity, and treachery. While in France he wrote his celebrated *Reflections Upon Exile*; and in 1716 drew up a vindication of his conduct, in the form of A Letter to Sir William Wyndham. His first lady being dead, he married a niece of Madame de Maintenon, and widow of the marquis de Vilette, with whom he had a very large fortune. In 1723 the king being prevailed on to grant him a free pardon, he returned to England; but was by no means satisfied to remain a mere titular lord, excluded from the house of peers. This confirmed his enmity to Sir Robert Walpole, to whom he attributed his not receiving the full extent of the king's clemency: hence he distinguished himself by a multitude of political writings, till 1735, when he returned to France. In this retreat he began his course of *Letters on the Study and Use of History*, for the use of lord Cornbury, to whom they are addressed. Upon the death of his father he settled at Battersea, the ancient seat of his family, where he passed the remainder of his life. He died in 1751, and left his MSS. to Mr. Mallet, who published them with his former printed works, in 5 vols., 4to; they are also printed in 8vo.

St. JUST (Anthony), a political demagogue of the French Revolution, associated in the crimes and punishment of Robespierre. He was born in 1768 and educated for the law. At the commencement of the revolution he was chosen a deputy to the convention from the department of the Aisne, and voted for the death of Louis XVI.; assisted materially in the destruction of the Girondists, and was subsequently sent, as a commissioner of the national convention, to the army in Alsace, when, in conjunction with Lebas, he carried to a great extent the system of terror both among the troops and people. St. Just, on his return to Paris, towards the close of 1793, obtained great influence; and Robespierre was principally guided by his violent counsels. After assisting in the overthrow of Danton and his friends, he became justly involved in the ruin of Robespierre, who rejected his advice in the last struggle. He was guillotined July 28, 1794. He was the author of *Organt*, a poem in twenty cantos, 1789, 2 vols. 8vo.; *Mes Passe-temps, ou le Nouvel Organt de 1792*, another licentious poem; and *Fragments sur les Institutions Republicaines*, a posthumous work, 1800, 12mo.; besides reports to the National Convention, from the Committees of General Surety and of Public

Safety. This wretch has been sometimes confounded with Louis Leon St. Just, who called himself the marquis de Fontvielle, and was the author of a work, entitled *Espirit de la Revolution, et de la Constitution de France*.

SAINTÉ MARTHE (Sccevola), was born at Loudun in 1536. He early acquired the Latin, Greek, and Hebrew languages, and became celebrated as a lawyer, orator, poet, and historian. He was much employed under Henry III. and IV. In 1579 he was governor and treasurer of Poitiers. In 1593 and 1594 he was intendant of finances in the army, and reduced Poitiers under Henry IV. He published 1. *La Louange de la Ville de Poitiers*; 1573: 2. *Opera Poetica*; Lat. et Gall.; 1575: 3. *Gallorum doctrinâ illustrium Elogia*; 1598: and *Padotrophia, seu de Puerorum Educatione*; dedicated to Henry III.; 1584. This last work went through ten editions during his life, and has been often reprinted. He died in 1623; leaving several sons.

SAINTÉ MARTHE (Abel), eldest son of Sccevola, was born at Loudun in 1570; and cultivated like him Latin and French poetry. His poems were printed with his father's in 1632, 4to. Louis XIII. gave him a pension; made him a counsellor of state; and, in 1627, made him his librarian. He published *Opuscula Varia*, at Poitiers, in 8vo., 1645. He died in 1652.

SAINTES, a considerable and ancient town in the south-east of France, in the department of the Lower Charente, near the river of that name. It was, in the time of the Romans, one of the chief cities of Aquitaine, and subsequently the capital of the province of Saintonge. Its aspect from a distance is fine, but its streets are narrow and winding, and its houses ill built; it contains a cathedral founded by Charlemagne, a Roman amphitheatre, an aqueduct, and a triumphal arch of white marble on the bridge across the Charente. Inhabitants 10,500. Forty-two miles south-east of Rochelle.

SAKE, *n. s.* Sax. *rac*; Goth. *sac*; Belg. *saecke*. Account; cause; end; purpose.

Would I were young for your *sake*, mistress Anne.
Shakspeare.

Thou neither do'st persuade me to seek wealth
For empire's *sake*, nor empire to affect
For glory's *sake*. *Milton's Paradise Lost.*

The profane person serves the devil for nought, and
sins only for sin's *sake*. *Tillotson.*

Wyndham like a tyrant throws the dart,
And takes a cruel pleasure in the smart;
Proud of the ravage that her beauties make,
Delights in wounds, and kills for killing *sake*.
Granville.

SA'KER, *n. s.* Saker originally signified a hawk: then a small piece of artillery.

According to observations made with one of her majesty's *sakers*, and a very accurate pendulum chronometer, a bullet, at its first discharge, flies five hundred and ten yards in five half seconds, which is a mile in a little above seventeen half seconds.

Derham's Physico-Theology.
The cannon, blunderbuss, and *saker*,
He was the inventor of and *maker*. *Hudibras.*

SAKERET, *n. s.* From *saker*. The male of a saker-hawk. This kind of hawk is esteemed next after the falcon, and gyr-falcon. *Bailey.*

SAL, *n. s.* Lat. *sal*. Salt. A word often used in pharmacy.

Acids will help its passing off; as *sal* prunel.

Floyer.

Sal gem is so called from its breaking frequently into gemlike squares. It differs not in property from the common salt of the salt springs or that of the sea, when all are equally pure.

Woodward's Met. Foss.

SAL ALEMBROTH, a compound of muriate of mercury and ammonia.

SAL AMMONIAC, muriate of ammonia. See **AMMONIA**, **AMMONIAC SAL**, and **MURIATIC ACID**. This salt, according to Mongou, is met with in the form of an efflorescence on the surface of the earth, or adhering in powder to rocks. Sometimes, as in Persia and the country of the Kalmucks, it is found as hard as stone. It is met with of different colors, as gray, black, green, and red, in the neighbourhood of volcanoes, in the caverns or grottos of Puzzuoli, and in the mineral lakes of Tuscany, as well as in some mountains of Tartary and Thibet. At Solfaterra, near Naples, it is found in the crevices, of a yellowish color, like common sal ammoniac that has been often sublimed.

SAL PRUNELLE, nitrate of potass cast into round balls or flat cakes after being fused.

SALACIA, in botany, a genus of the trigynia order, and gynandria class of plants; *CAL*. quinquefid; *cor*. quinquepetalous; antheræ on the top of the germ. Species two, natives of China.

SALACIOUS, *adj.* } Fr. *salace*; Lat. *salar*.

SALACITY, *n. s.* } Lustful; lecherous; lust.

Immoderate *salacity* and excess of venery is supposed to shorten the lives of cocks.

Brown's Vulgar Errors.

One more *salacious*, rich, and old,

Out-bids, and buys her. *Dryden's Juvenal.*

A corrosive acrimony in the seminal lymphæ produces *salacity*. *Floyer on the Humours.*

Animals spleened, grow extremely *salacious*.

Arbuthnot.

SALAD, *n. s.* Fr. *salade*. Food of raw herbs. It has been generally pronounced *sallet*.

I climbed into this garden to pick a *salad*, which is not amiss to cool a man's stomach.

Shakspeare. Henry VI.

My *sallet* days,

When I was green in judgment, cold in blood.

Shakspeare.

You have, to rectify your palate,

An olive, capers, some better *salad*,

Ushering the mutton. *Ben Jonson.*

I tried upon *sallet* oil.

Boyle.

Some coarse cold *salad* is before thee set;

Fall on. *Dryden's Persius.*

Sow some early *salletting*. *Mortimer's Husbandry.*

Leaves eaten raw are termed *salad*; if boiled they become potherbs; and some of those plants which are potherbs in one family are *salad* in another.

Watts.

SALADILLO, a river of Buenos Ayres, which rises in vast plains in the interior, and, running to the south-east, falls into the sea near the mouth of the La Plata, on the southern side.

SALADIN, a sultan of Egypt, equally renowned as a warrior and legislator. He supported himself by his valor against the united efforts of the chief Christian potentates of Europe,

who carried on the most unjust wars against him, under the false appellation of Holy Wars. See **CRUSADE**.

SALADO, an abundant river of South America, in the province of Tucuman, which has its rise from many streams flowing down the western declivity of the Andes, in lat. 24° S. It derives its name from the salt with which its waters are impregnated.

SALAMANCA, a province of Spain, forming the south part of the kingdom of Leon, and bordering on Portugal; between 5° and 7° of W. long., and 40° and 41° 38' of N. lat. It has a superficial extent of 1500 square miles, consisting partly of a dead flat, destitute of trees, and deficient in water; partly, particularly in the south, of lofty mountains, where are found the Sierras of Francia, Bejar, Gredos, Gata, and Puerto del Pico. It is watered by the Douro, the Aguedar, the Yeltes, the Tormes, and the Alagon, and contains the small lake of Gredos. The climate is in general dry and hot; but the mountains are rich in minerals, and the more favorable exposures produce vines, and other fruits of a warm climate. The wool of this province is good; the best pastures being allotted to the Merino breed of sheep. Inhabitants 200,000. The contraband trade with Portugal is very considerable.

SALAMANCA, an ancient city of Spain, is situated on the ascent of three hills, having the river Tormes at their base. The environs are pleasant, and, along with the numerous spires of the city, are happily contrasted with the surrounding monotonous country. The town has a wall, thirteen gates, several squares and fountains, and a number of massy buildings; but the streets are all on uneven ground, and often in want of water. The houses are uniform, and of a good height, with balconies in front; and one of the sides of the great square is occupied by the town-house. Other public buildings are the cathedral, university, churches, and convents. The cathedral is a majestic Gothic edifice, entered by a fine gate, and admired in the interior for the boldness of the arches, and the finished character of the sculpture. The bishop's see is of very remote date.

The university was founded in 1239, and had long a considerable reputation. The buildings are still extensive, consisting of twenty-five colleges, and the number of professional chairs fully sixty; while the students do not at present exceed 300 or 400.

Here are various vestiges of antiquity, in particular a Roman road leading to Merida, and a Roman bridge over the Tormes, of twenty-seven arches, and about 500 feet in length. The banks of the river, and the country to the west of Salamanca, were the scene of an engagement between the British under lord Wellington, and the French under Marmont, in July 1812. Salamanca is 153 miles W.N.W. of Madrid.

SALAMANCA, a small town of Mexico, in the intendency of Guanajuato, situated in a rising plain, at the height of 7075 feet above the level of the sea. It is about seventy miles N.N.W. of Valladolid, and 150 north-west of Mexico. Also, formerly, a city of South America, in the

kingdom of New Granada, and province of Santa Martha, of which little remains but a small village.

SALAMANDER, *n. s.* } *Fr. salamandre ;*
SALAMAN'DRINE, *adj.* } *Lat. salamandra.* An animal supposed to live in the fire, and imagined to be very poisonous: salamandrine, capable of bearing fire unhurt.

The *salamander* liveth in the fire, and hath force also to extinguish it. *Bacon's Natural History.*

There may be such candles as are made of *salamander's* wool, being a kind of mineral, which whiteneth in the burning, and consumeth not.

Bacon.

According to this hypothesis, the whole lunar world is a torrid zone, and may be supposed uninhabitable, except they are *salamanders* which dwell therein. *Glanville's Sccepsis.*

Whereas it is commonly said that a *salamander* extinguisheth fire, we have found by experience that on hot coals it dieth immediately.

Broun's Vulgar Errors.

Laying it into a pan of burning coals, we observed a certain *salamandrine* quality, that made it capable of living in the midst of fire, without being consumed or singed. *Spectator.*

The artist was so encompassed with fire and smoke that one would have thought nothing but a *salamander* could have been safe in such a situation.

Addison's Guardian.

Of English tale, the coarser sort is called *plaster* or *parget*; the finer, *spald*, *earth flax*, or *salamander's* hair. *Woodward.*

SALAMANDER. See **LACERTA.**

SALAMIS, an island of the archipelago, in the Sinus Saronicus, on the south coast of Attica, opposite to Eleusis; celebrated for a battle between the Greek and Persian fleets. In the council of war held before this battle, among the Persians, queen Artemisia was the only person who opposed their design of engaging. She was queen of Halicarnassus, and followed Xerxes in this war with five ships, the best equipped of any in the fleet, except those of the Sidonians. She represented in the council of war the dangerous consequences of engaging a people far more expert in maritime affairs than the Persians; alleging that the loss of a battle at sea would be attended with the ruin of their army; whereas, by lengthening out the war, and advancing into the heart of Greece, they would create jealousies and divisions among their enemies, who would separate to defend each his own country; and that the king might thus make himself master of Greece. This prudent advice was not followed, but an engagement was resolved upon. Xerxes, to encourage his men, caused a throne to be erected on the top of an eminence, whence he might safely behold whatever happened; having several scribes about him, to write down the names of such as should signalise themselves. The approach of the Persian fleet, with the news that a strong detachment from the army was marching against Cleombrotus, who defended the isthmus, struck such terror into the Peloponnesians that they could not be prevailed upon to stay any longer at Salamis, but insisted on returning to their own country. Themistocles, hearing of this, privately despatched a trusty friend to the Persian commanders, informing them of the intended flight,

and exhorting them to send part of their fleet round the island, to prevent their escape. The same messenger assured Xerxes that Themistocles designed to join the Persians, as soon as the battle began, with all the Athenian ships. The king, giving credit to this, immediately caused a strong squadron to sail round the island in the night to cut off the enemy's retreat. Early next morning, as the Peloponnesians were preparing to set sail, they found themselves encompassed on all sides by the Persian fleet, and were against their inclination compelled to remain in the straits of Salamis and expose themselves to the same dangers with their allies. As to the number of the Persian ships the poet Eschylus speaks of it in his tragedy of Persæ as a matter he was well assured of:

A thousand ships (for well I know the number
 The Persian flag obeyed), two hundred more
 And seven, o'erspread the seas.

The Athenians had only 180 galleys, each carried eighteen men that fought upon deck, four of whom were archers and the rest heavy armed. Themistocles avoided the engagement till a certain wind, which rose regularly every day at the same time, began to blow. As soon as this wind blew he gave the signal for battle. The Persians advanced with great resolutions, but the wind blowing directly in their faces, and the largeness and number of their ships embarrassing them in a place so narrow, they were thrown into disorder; which the Greeks observing, broke into the Persian fleet; some of whom fled towards Phalarus, where their army lay encamped; others saving themselves in the harbours of the neighbouring islands. Queen Artemisia distinguished herself, her ships being the last that fled: which Xerxes observing, cried out that the men behaved like women, and the women with the courage and intrepidity of men. The Athenians offered a reward of 10,000 drachmas to any one that should take her alive, but she got clear of the ships and arrived safe on the coast of Asia. In this engagement the Grecians lost forty ships; and the Persians 200, besides many more that were captured. Pausanias says that on one side of this island stood in his time a temple of Diana, and on the other a trophy for a victory obtained by Themistocles, together with the temple of Cenchreus, or Cyclopeus, the site of which is now thought to be occupied by the church of St. Nicholas.

SALAMIS, the capital of the above island. This city was demolished by the Athenians, because in the war with Cassander it surrendered to the Macedonians. In the second century, when it was visited by Pausanias, some ruins of the Agora or market-place remained, with a temple and image of Ajax; and not far from the port was shown a stone, on which they related Telamon sat to view the Salaminian ships on their departure to join the Grecian fleet at Aulis. The walls may still be traced, and were about four miles in circumference. The level space within them is now covered with green corn. The port is choked with mud, and was partly dry. Among the scattered marbles are some with inscriptions. On one, near the port, the name

of Solon occurs. This renowned lawgiver was a native of Salamis, and a statue of him was erected in the market-place, with one hand covered by his vest, the modest attitude in which he was accustomed to address the people of Athens. The island of Salamis is now inhabited by a few Albanians, who till the ground.

SALAMIS, SALAMINA, or SALAMINIA, an ancient town of Cyprus on the south-east coast. It was built by Teucer, and so named by him from the island from which he had been banished, about A. A. C. 1270. His descendants continued masters of it for above 800 years. It was destroyed by an earthquake, but rebuilt in the fourth century, and called Constantia. It is now called Salina.

SALAMIS, in the mythology, a daughter of the river god Asopus, by the nymph Methone. Neptune became enamoured of her, and carried her to the island afterwards named from her, where she bore him a son, named Ceuchreus.

SALAPIA, or SALAPIÆ, in ancient geography, a town of Italy, in Apulia; to which Hannibal retired after the battle of Cannæ. It was afterwards taken from him by Marcellus.

SALARY, *n. s.* Fr. *salair*; Lat. *salarium*. Stated hire; annual or periodical payment of money.

This is hire and *salary*, not revenge. *Shakspeare.*

Several persons, out of a *salary* of five hundred pounds, have always lived at the rate of two thousand. *Swift.*

SALASSI, an ancient people of Gallia Cisalpina, who were often at war with the Romans. In A. U. C. 610 they cut off an army of 10,000 Romans under Appius Claudius; but were soon after defeated, and at last totally subdued, and sold as slaves by Augustus. Their country was settled by a Roman colony, and called Prætoria Augusta.

SALE, <i>n. s.</i>	} Goth. <i>salu</i> ; Belg. <i>saal</i> . The act or power of selling; vent; market; public market; auction; price: used by Spenser for a sale basket
SALE'ABLE, <i>adj.</i>	
SALE'ABLY, <i>adv.</i>	
SALES'MAN, <i>n. s.</i>	
SALE'WORK.	

the derivatives correspond: sale-work is, work merely for sale; careless work.

Nothing doth more enrich any country than many towns; for the countrymen will be more industrious in tillage, and rearing of all husbandry commodities, knowing that they shall have ready *sale* for them at those towns. *Spenser.*

To make baskets of bulrushes was my wont;
Who to entrap the fish in winding *sale*
Was better? *Id.*

The other is not a thing for *sale*, and only the gift of the gods. *Shakspeare. Cymbeline.*

I see no more in you than in the ordinary
Of Nature's *sale-work*. *Id. As You Like It.*

I can impute this general enlargement of *saleable* things to no cause sooner than the Cornishman's want of vent and money. *Carew.*

Others more moderate seeming, but their aim
Private reward; for which both God and state
They'd set to *sale*. *Milton's Agonistes.*

Those that won the plate, and those thus sold,
ought to be marked so as they may never return to the race or to the *sale*. *Temple.*

This vent is made quicker or slower as greater or less quantities of any *saleable* commodity are removed out of the course of trade. *Locke.*

The more money a man spends, the more must he endeavour to increase his stock; which at last sets the liberty of a commonwealth to *sale*. *Addison.*

Poets make characters, as *salesmen* cloaths;
We take no measure of your fops and beaus. *Swift.*

SALE is the exchange of a commodity for money; barter, or permutation, is the exchange of one commodity for another. When the bargain is concluded, an obligation is contracted by the buyer to pay the value, and by the seller to deliver the commodity at the time and place agreed on, or immediately, if no time be specified. In this, as well as other mercantile contracts, the safety of commerce requires the utmost good faith and veracity. Therefore, although, by the laws of England, a sale above the value of £10 be not binding, unless earnest be paid, or the bargain be confirmed by writing, a merchant would lose all credit who refused to perform his agreement, although these legal requisites were omitted. When a specific thing is sold, the property, even before delivery, is in some respect vested in the buyer; and, if the thing perishes, the buyer must bear the loss. For example, if a horse dies before delivery, he must pay the value; but, if the bargain only determines the quantity and quality of the goods, without specifying the identical articles, and the seller's warehouse with all his goods be burned, he is entitled to no payment. He must also bear the loss if the thing perish through his fault. If a person purchase goods at a shop without agreeing for the price, he is liable for the ordinary market-price at the time of purchase. If the buyer prove insolvent before delivery, the seller is not bound to deliver the goods without payment or security. If the importation, or use of the commodities sold, be prohibited by law, or if the buyer knows that they were smuggled, no action lies for delivery. The property of goods is generally presumed, in favor of commerce, to belong to the possessor, and cannot be challenged in the hands of an onerous purchaser. But to this there are some exceptions. By the Scotch law stolen goods may in all cases be reclaimed by the proprietor, and also by the English law, unless they were bought *bonâ fide* in open market; that is, in the accustomed public places, on stated days in the country, or in a shop in London; and horses may be reclaimed, unless the sale be regularly entered by the book-keeper of the market. In all cases, if the goods be evicted by the lawful proprietor, the seller is liable to the purchaser for the value. Actions for payment of shop-accounts, as well as other debts not constituted by writing, are limited in England to six years. The testimony of one witness is admitted; and the seller's books, although the person that kept them be dead, are good evidence for one year. In Scotland merchants' books may be proved within three years of the date of the last article, by one witness, and the creditor's books, and oath in supplement. After three years they can only be proved by the oath or writ of the debtor. A merchant's books are in all cases good evidence against him.

SALE (George), a learned English author, one of the writers in the Universal History, all the oriental part of which he compiled. He was

also engaged in other important literary labors; but his chief work is *The Koran of Mahomet*, which he translated into English from the original Arabic, and enriched with explanatory notes from the most approved commentators; and to which he prefixed a *Preliminary Discourse*; London, 4to. 1733. Mr. Sale died in 1736.

SALEM, a post town of Rockingham county, New Hampshire, thirty-five miles north of Boston, and thirty-five south-west of Portsmouth. Here is a woollen manufactory.

SALEM, a sea-port town of the United States, capital of Essex county, Massachusetts, four miles and a half north-west of Marblehead, fourteen N. N. E. of Boston, twenty-four south of Newburyport. It is chiefly built on a tongue of land formed by two inlets from the sea, called North and South rivers; over the former of which is a bridge, upwards of 1500 feet long, connecting Salem with Beverly, and the latter forms the harbour. The harbour has good anchorage, but the water is so shallow that vessels drawing more than twelve or fourteen feet must unload, in part, at a distance from the wharfs. The situation of Salem is low, but pleasant; it is well built; and with regard to population, wealth, and commerce, is the second town in New England. It contains a court-house, jail, alms-house, market-house, three banks, four insurance-offices, a custom-house, a grammar school, an orphan asylum, a bank for savings, a museum, an athenæum containing upwards of 5000 volumes well selected, and eleven houses of public worship, six for Congregationalists, two for Baptists, one for Episcopalians, one for Friends, and one for Universalists. It has numerous public and private schools, which are well supported. None of the public buildings are splendid: but the court-house, the market-house, the alms-house, the custom-house, and the grammar school-house, all of brick, and the jail of stone, are spacious, handsome, and commodious. The churches are large, neat, and convenient. Three of them are furnished with organs, and six with steeples or cupolas. The private houses have generally the appearance of neatness, convenience, and comfort; and many of them indicate taste and opulence. The town was formerly built almost entirely of wood, but a large proportion of the houses erected within the last twenty years are of brick.

The appearance of Salem is very irregular, the streets having been laid out with little regard to symmetry or beauty. In the northern part of the town there is a common, containing about ten acres, surrounded by a handsome public walk, which is planted with rows of trees. On a peninsula below the town there are two forts, Fort Pickering and Fort Lee, and on Baker's Island there is a light house.

Salem is, next to Plymouth, the oldest town in the state, and was settled in 1626. The inhabitants are chiefly employed in trade and navigation. The shipping belonging to this port in 1816 amounted to 34,454 tons. The East India trade has, for several years, been carried on here with great spirit and advantage, and it is to this branch of commerce that the town is indebted

for a great part of its wealth. The number of vessels employed at present in this trade amounts to fifty-three, carrying 14,272 tons. There are now living about 160 persons, who, as masters or supercargoes of vessels, have sailed from this town round the Cape of Good Hope, or Cape Horn. A society composed of such persons, styled the East India Marine Society, was incorporated in 1801; the object of which is to afford relief to indigent members or their families, to promote the knowledge of navigation and trade to the East Indies, and to increase the museum. The museum belongs to this society, and is a very extensive and interesting cabinet of curiosities collected from all parts of the world, and is visited free of expense.

SALEM, New, a post town of Franklin county, Massachusetts; eighteen miles E. S. E. of Greenfield, eighty west of Boston, west 452. Population 2167. Here is a respectable academy.

SALEM, a post town of Washington county, New York, eighteen miles south-east of Sandy Hill. Population 2833. The courts for the county are held alternately here and at Sandy Hill. Here is a handsome town, on an extensive plain, containing a court house, a jail, an academy, and two churches. Two weekly newspapers are published.

SALENGORE, a Malay principality, extending a considerable space along the western coast of the Malay peninsula. It is governed by a Mahometan prince, who bears the title of rajah. The rajah monopolises the greater part of the trade, and is thus induced to afford protection to vessels coming up the river of Salengore. There are several other rivers traversing the territory, and falling into the straits of Malacca; particularly one called Burnam, from which a great number of long rattans are brought. The commodities fitted for exportation here are tin, rattans, gold dust, elephants' teeth, dragon's blood, camphire, with some pepper, and other spices. These are given in exchange for opium, piece goods, gunpowder, cutlery, steel, copper, iron, and some woollens. The Chinese and the Birgis of Celebes carry on a good deal of trade at this port. Long. 101° 18' E.; lat. 3° 20' N.

SALEP, in the materia medica, the dried root of a species of orchis. See **ORCHIS**. Several methods of preparing salep have been practised. Geoffroy has given a very judicious process for this purpose in the *Histoire de L'Academie Royale des Sciences*, 1740; and Retzius in the *Swedish Transactions*, 1764, has improved Geoffroy's method. Mr. Moulton of Rochdale also found a method of curing the orchis root; by which salep is prepared, at least equal, if not superior, to any brought from the Levant. The new root is to be washed in water; and the fine brown skin which covers it is to be separated by a small brush, or by dipping the root in hot water, and rubbing it with a coarse linen cloth. When a sufficient number of roots have been thus cleaned, they are spread on a tin plate, and placed in an oven heated to the usual degree, where they are to remain six or ten minutes, in which time they will have lost their milky whiteness, and acquired a transparency like horn, without any diminution of bulk. They are then to be re-

moved to dry and harden in the air, which will require several days to effect; or, by using a very gentle heat, they may be finished in a few hours. Salep, thus prepared, may be afforded in places where labor bears a high value, at about 8*d.* or 10*d.* per pound. And it might be sold still cheaper, if the orchis were to be cured, without separating from it the brown skin which covers it; a troublesome part of the process, and which does not contribute to render the root either more palatable or salutary. The foreign salep is sold at 5*s.* or 6*s.* per pound. As a wholesome nourishment, says Dr. Percival in his *Essays, Medical and Experimental*, rice is much inferior to salep. Salep has the singular property of concealing the taste of salt water; a circumstance of the highest importance at sea, when there is a scarcity of fresh water. The restorative, mucilaginous, and demulcent qualities of the orchis root, render it of considerable use in various diseases. In the sea-scurvy it lessens the acrimony of the fluids, and at the same time is easily assimilated into a mild and nutritious chyle. The ancient chemists entertained a very high opinion of the orchis root, as appears from the *secreta secretorum* of Raymond Lully, 1565.

SALERNO, a city of Italy, in the kingdom of Naples, the capital of the province of Principato Citra, and having a population of 10,000. Though delightfully situated, the town itself is not agreeable: the streets are paved with lava, narrow and irregular, and have a gloomy appearance, from the height of the houses. Salerno is an ancient city, and has in front of the cathedral twenty-eight ancient granite columns. The harbour is good. Twenty-eight miles E. S. E. of Naples.

SALES (St. Francis de), a Romish saint, born at Sales castle in 1567. In 1602 he was made bishop of Geneva, in which station his conduct was pious and exemplary; he founded a society of religious, called the Order of the Visitation; which was sanctioned by Paul V. in 1618. He died in 1622, and was canonized by Alexander VI. He wrote, 1. *An Introduction to a Devout Life*; 2. *A Treatise on the Love of God*; and *Letters*.

SALET, in war, a light covering or armour for the head, anciently worn by the light horse, only different from the casque in that it had no crest, and was little more than a bare cap.

SALIENT, in fortification, denotes projecting. There are two kinds of angles, the one salient, which have their point outwards; the other re-entering, which have their points inwards.

SALIC, or **SALIQUE**, law (*lex salica*), an ancient and fundamental law of the kingdom of France, usually supposed to have been made by Pharamond, or by Clovis; in virtue whereof males only are to inherit. Some, as Postellus, suppose it to have been called Salic, q. d. Gallic, because peculiar to the Gauls. For Montanus insists, it was because Pharamond was at first called Salicus. Others believe it to have been so named, because used only in the Salic lands. These were noble fiefs which their first kings used to bestow on the sallians, that is, the great lord of their salle or court, without any other tenure than military service; and, for this reason,

such fiefs were not to descend to women, as being by nature unfit for such a tenure. Shakspeare represents it as derived from the name of the river Sala, in Germany, and says—

‘That the land of Salique lies in Germany,
Between the floods of Sala and of Elbe,
Where Charles the Great, having subdued the
Saxons,

There left behind and settled certain French
Who, holding in disdain the German women
For some dishonest manners of their life,
Established there this law. *Henry V.*, act 1.

Montesquieu derives the origin of this word from the Salians, a tribe of Franks who settled in Gaul in the reign of Julian, who is said to have given them lands on condition of their personal service in war. Before the election of the Merovingian kings, this powerful tribe of the Franks appointed four venerable chieftains to compose their laws; and their labors were examined and approved in three successive assemblies of the people. After the baptism of Clovis, he reformed several articles incompatible with Christianity. The Salic law was again amended by his sons; and, under the reign Dagobert, the code was revised and promulgated 100 years after the establishment of the French monarchy. If it be asked, how it came to pass that the Salic laws gained general authority in the country of the Franks, and the Roman law gradually declined; while in the jurisdiction of the Visigoths the Roman law spread itself, and obtained at last a general sway? Montesquieu replies that the Roman law was disused among the Franks, on account of the great advantages accruing from being a Frank to a person living under the Salic law. The clergy alone retained the old law, because a change could be of no advantage to them. The Roman law inflicted no hardships upon them, as it was the work of Christian emperors. ‘This law,’ says Millot, ‘fixed the punishment of crimes and various points of police. There is no ground for believing, that it expressly settled the right of succession to the crown. It only says that, with relation to the salic land, women have no share of heritage, without restricting it to the royal family; for all those were called salic lands which were held by right of conquest; and it is easy to conceive, that a nation of soldiers, whose general was their king, would not submit to be governed by a woman. A long custom, supported by the principles of the nation, became in time the established law of the kingdom.’

SALICORNIA, jointed glass-wort, or salt-wort, a genus of the monogynia order, and monandria class of plants: natural order twelfth, holoracæ: *CAL.* ventricose, or a little swelling out and entire: there are no petals, and but one SEED. There are nine species, of which the most remarkable are—

1. *S. fruticosa*, with obtuse points, grows plentifully in the salt-marshes which are overflowed by the tides in many parts of England. It is an annual plant, with thick, succulent, jointed stalks, which trail upon the ground. The flowers are produced at the ends of the joints toward the extremity of the branches, which are small, and scarcely discernible by the naked eye.

2. *S. perennis*, with a shrubby branching stalk, grows naturally in Sheppey Island. This has a shrubby branching stalk about six inches long; the points of the articulations are acute; the stalks branch from the bottom, and form a kind of pyramid. They are perennial, and produce their flowers in the same manner as the former. The inhabitants near the sea coasts, where these plants grow, cut them up towards the latter end of summer, when they are fully grown; and, after having dried them in the sun, they burn them for their ashes, which are used in making of glass and soap. These herbs are by the country people called kelp, and promiscuously gathered for use. Barilla is likewise made from them. They are also used for dyeing leather red, instead of the shenan.

SALIENT, *adj.* Latin, *salien*s. Leaping; bounding; moving by leaps.

The legs of both sides moving together as frogs, and *salient* animals, is properly called leaping.

Browne's Vulgar Errors.

A *salient* point, so first is called the heart, By turns dilated, and by turns compressed, Expels and entertains the purple guest. *Blackmore.*

Who best can send on high

The *salient* spout, far streaming to the sky. ; *Pope.*

SALII, in Roman antiquity, priests of Mars, of whom Numa instituted twelve, who wore painted particolored garments, and high bonnets; with a steel cuirass on the breast. They were called *salii*, from *saltare* to dance; because, after assisting at sacrifices, they went dancing about the streets, with bucklers in their left hand, and a rod in their right, striking with their rods on one another's bucklers, and singing hymns in honor of the gods. Their feasts were uncommonly sumptuous, whence dapes *saliares* is proverbially applied to repasts splendid and costly. Their chief, called *præsul* and *magister saliorum*, was one of their members, and led the band, the rest imitating all his steps and motions. The whole company was called *collegium saliorum*. Sext. Pompeius makes mention of *salian* maids, virgines *saliares*, hired for the purpose, and joined with the *salii*, wearing a kind of military garb, called *paludamentum*, with high round bonnets like the *salii*, and like them performing sacrifice with the pontifices.

SALIMBENI (Venura), an eminent historical painter, born at Sienna, in Tuscany, in 1557. There was a fine picture by him of the descent of the Spirit on the apostles at Pentecost, in the possession of the earl of Pembroke. He died in 1613.

SALINE, *adj.* } Lat. *salinus*. Consisting
SALINOUS, *adj.* } of, or forming, salt.

We do not easily ascribe their induration to cold; but rather unto *salinous* spirits and concrete juices.

Browne.

This *saline* sap of the vessels, by being refused reception of the parts, declares itself in a more hostile manner, by drying the radical moisture.

Harvey on Consumptions.

If a very small quantity of any salt or vitriol be dissolved in a great quantity of water, the particles of the salt or vitriol will not sink to the bottom, though they be heavier in specie than the water; but will evenly diffuse themselves into all the water, so as to make it as *saline* at the top as at the bottom.

Newton's Optics.

As the substance of coagulation is not merely *saline*, nothing dissolves them but what penetrates and relaxes at the same time. *Arbuthnot on Aliments.*

SALISBURY, the capital or county town of Wiltshire, is situated in a vale, at the confluence of the Wile and Nadder, with the Avon. It owed its origin to the cathedral, which was begun in 1220, by bishop Poor, and finished in 1256, when the see was held by William of York. This building is in the early pointed style of architecture, and may be justly regarded as one of the most elegant and regular ecclesiastical structures in the kingdom. It is in the form of a double cross, and consists of a nave and choir, with two side aisles, and two transepts, each with its aisle. Connected with it is a handsome quadrangular cloister, and an octagon chapter-house. The spire, which is evidently a later erection, and was probably begun at the latter end of Edward II., or the beginning of Edward III.'s reign, rises on four pillars, at the intersection of the nave and principal transept, to the stupendous height of 400 feet. Although it declines above two feet from the perpendicular, it has yet withstood the storms and tempests of ages, and the effects of time and accident; and seems likely to remain for centuries a monument of singular architectural boldness, skill, and perseverance. The chapter-house is also a beautiful specimen of architecture, the groined roof of fifty feet in diameter being poised on a single slender pillar in the centre.

The cathedral establishment consists of a dean, forty-one prebendaries, six of whom are residentiary, and called canons, a sub-dean, sub-chanter, four vicars choral, seven lay-vicars, one of whom is organist, and eight choristers. The chapter is composed of the dean and residentiary canons; and the close in which the cathedral is situated is environed with a wall, and forms a distinct jurisdiction, under the dean, in virtue of letters patent granted by Edward III. The bishop, who is a member of the cathedral establishment, as prebendary of Potern, has under him the archdeacons of Sarum, Wilts, and Berks, for the superintendence of his diocese. In the close is a college, for the maintenance of a certain number of clergymen's widows, built and endowed by bishop Seth Ward.

The city, which is erected on ground originally belonging to the see, acknowledges the bishop as lord of the manor. It is incorporate, and governed by a mayor, high steward, recorder, twelve justices, fourteen aldermen, and thirty common-councilmen. The justices are chosen from the aldermen, and the aldermen from those who have borne the office of mayor.

It contains the three parish churches of St. Thomas, St. Edmund, and St. Martin; and includes the suburbs of Fisherton and East Harnham.

An attempt was made, under bishop Ward, in the reign of Charles II., to render the Avon navigable to Christchurch; and, about thirty years ago, a canal was begun to form a water communication with the port of Southampton; but both these projects proved abortive. With respect to land communications, the city was essentially benefited by the turning of the great

western road through it, which was effected soon after the commencement of the cathedral. To this advantage, and to its central situation in regard to the great towns, in the west and south of England, Salisbury owes much of its present importance; for its manufactures of cloth, flannel, and lace, are now in a manner extinct, and its cutlery much reduced, in consequence of the competition of Birmingham, Sheffield, &c. Besides the parish churches, the principal buildings are the council-house, erected at the expense of the late earl of Radnor; the general infirmary, supported by voluntary contribution; and the county prison. These two last are situated in Fisherton. There are many alms-houses and charitable establishments, the chief of which is the hospital of St. Nicholas, founded, or at least endowed, by bishop Bingham. Salisbury is twenty-one miles north-east from Southampton, eighty-two W. S. W. from London, ninety-one E. N. E. from Exeter, and thirty-seven south-west from Bath. Lat. $51^{\circ} 3' N.$, long. $1^{\circ} 42' E.$ It sends two representatives to parliament, the right of election being vested in the corporation.

Old Sarum, the parent of the present city, which is sometimes called New Sarum, is situated about a mile and a half to the north. It consists of a circular rampart and ditch, formed by scarping down a hill, and a mound in the centre, which was probably crowned by the keep or citadel. It was originally a fortress of the Britons; was afterwards occupied by the Romans, of whose military ways, four diverged from this spot; next by the Saxons; and finally rendered by the Norman sovereigns a post of considerable importance. Of its buildings nothing remains but a few trifling fragments, though it still enjoys the privilege of sending two members to parliament, who are chosen by the occupiers of certain lands in the vicinity.

SALISBURY, a post town of Hillsborough county, New Hampshire, on the west side of the Merrimack; fourteen miles N. N. W. of Concord, thirty-eight south-east of Dartmouth College, fifty-nine W. N. W. of Portsmouth. The fourth New Hampshire turnpike passes through this town, and upon this road, in the south part of the town, there is a pleasant village, containing a Congregational meeting house, and an academy; and about two miles above, on the turnpike, there is a Baptist meeting-house. On the Merrimack near the mouth of the Winnipisogee, there is another flourishing village. Salisbury is a very good agricultural town.—Also a post town of Essex county, Massachusetts, on the north bank of the Merrimack; four miles north-west of Newburyport, thirty-six N. N. E. of Boston. It contains two parishes, and has a pleasant and considerable village, on the north bank of the Merrimack, below the junction of the Powow River. Considerable business is done at this village at ship building, and here is some trade in the fisheries.—Also a post town of Litchfield county, Connecticut, in the north-west corner of the state; twenty-four miles north-west of Litchfield. It is a considerable town, and the neighbourhood contains large quantities of iron ore.

SALIVA, *n. s.* Lat. *saliva*. Every thing **SALIVAT**, *adj.* } that is spit up; more strictly **SALIVOUS**, *v. a.* } that juice which is separated by the glands called salival: relating to the saliva: to salivate is to cleanse or purge by means of the salival glands.

The woodpecker, and other birds that prey upon flies, which they catch with their tongue, in the room of the said glands have a couple of bags filled with a viscous humour, which, by small canals, like the *salival*, being brought into their mouths, they dip their tongues herein, and so with the help of this natural bird-lime attack the prey. *Grew.*

Holding of ill tasted things in the mouth will make a small *salivation*. *Id. Cosmologia.*

The necessity of spittle to dissolve the aliment appears from the contrivance of nature in making the *salivary* ducts of animals which ruminate, extremely open: such animals as swallow their aliment without chewing, want *salivary* glands. *Arbuthnot.*

Not meeting with disturbance from the *saliva*, I the sooner extirpated them. *Wiseman's Surgery.*

She was prepossessed with the scandal of *salivating*, and went out of town. *Id.*

There happeneth an elongation of the uvula, through the abundance of *salivous* humour flowing upon it. *Wiseman.*

SALIVA is that fluid by which the mouth and tongue are continually moistened in their natural state; and which is supplied by glands which form it, called *salivary* glands. This humor is thin and pellucid, incapable of being concreted by the fire, almost without taste and smell. *Saliva*, beside water, which constitutes at least four-fifths of its bulk, contains the following ingredients:—1. Mucilage. 2. Albumen. 3. Muriate of soda. 4. Phosphate of soda. 5. Phosphate of lime. 6. Phosphate of ammonia. Like all the other animal fluids, it is however liable to many changes from disease, &c. Brugnatelli found the *saliva* of a patient laboring under an obstinate venereal disease impregnated with oxalic acid. The concretions which sometimes form in the *salivary* ducts, &c., and the tartar or bony crust which so often attaches itself to the teeth, are composed of phosphate of lime. It has a great affinity for oxygen, absorbs it readily from the air, and gives it out again to other bodies. Hence the reason why gold or silver, triturated with *saliva* in a mortar, is oxidated, as Du Tennaer has observed. Hence also the reason that *saliva* is a useful application to sores of the skin. Dogs and other animals have constantly recourse to this remedy, and with much advantage.

SALIVATION, in medicine, is effected chiefly by mercury. The use of salivation is in diseases belonging to the glands and membrana adiposa, and principally in the cure of the venereal disease; though it is sometimes also used in epidemic and cutaneous diseases, &c.

SALIX, the willow, in botany, a genus of the diandria order, and diœcia class of plants: natural order fiftieth, amentaceæ: amentum of the male scaly: cor. none, but a nectariferous glandule at the base of the flower: female amentum scaly: cor. none; style bifid: caps. unilocular and bivalved: SEEDS pappous. The willow has been frequently the theme of poetical description,

both in ancient and modern times. There are seventy species; of which the most remarkable are,

1. *S. alba*, white or silver-leaved willow, growing to a great height and considerable bulk, having smooth pale green shoots; long, spear-shaped, acuminate, sawed, silvery-white leaves, downy on both sides, with glands below the serratures. This is the common white willow, which grows abundantly about towns and villages, and by the sides of rivers and brooks, &c.

2. *S. Babylonica*, Babylonian pendulous salix, commonly called weeping willow, grows to a largish size, having numerous long, slender, pendulous branches, hanging down loosely all round, and long, narrow, spear-shaped, serrated, smooth leaves. This curious willow is a native of the east, and is retained in our hardy plantations for ornament, and exhibits a most agreeable variety; particularly when disposed singly by the verge of any piece of water, or in spacious openings of grass ground.

3. *S. caprea*, the common sallow tree, grows to but a moderate height, having smooth, dark-green, brittle branches; oval, waved, rough leaves, indented at top, and woolly underneath. It grows abundantly in this country, but more frequently in dry than moist situations; it is of a brittle nature, and therefore unfit for the basket-makers; but will serve for poles, stakes, and to top for fire-wood; and its timber is good for many purposes.

4. *S. fissa*, basket osier. Leaves alternate, pedicelled, minutely toothed. A shrub four or five feet high, with erect, flexible, and very tough branches, of a yellowish ash color, sometimes purplish. A native of various parts of Europe, on the sandy banks of rivers, and in England cultivated in fens as preferable to all other willows or osiers for basket-work.

5. *S. fragilis*, fragile or crack willow, rises to a middling stature, with brownish, very brittle branches; long, oval, lanceolate, smooth leaves, of a shining green on both sides, having dentated glandular foot-stalks. This kind in particular being exceedingly fragile, so that it easily cracks and breaks, is unfit for culture in osier-grounds.

6. *S. pentandria*, broad-leaved, sweet-scented willow, grows to some considerable stature, having brownish-green branches; oblong, broad, scattered, smooth, sweet-scented leaves, shining above; and pentandrous flowers.

7. *S. purpurea*, purple or red willow, grows to a large height, having long, reddish, very pliable shoots, and long, spear-shaped, serrated, smooth leaves, the lower one being opposite.

8. *S. viminalis*, or osier willow, grows but to a moderate height, having slender rod-like branches; very long, pliant, greenish shoots; and very long, narrow, spear-shaped, acute, almost entire leaves, hoary, and silky underneath.

9. *S. vitellina*, yellow or golden willow, grows but to a moderate height; having yellow, very pliant shoots; oval, acute, serrated, very smooth leaves, with the serratures cartilaginous, and with callous punctures on the foot-stalks. All the species are of the tree kind, very hardy, remarkably fast growers, and several of them attaining a considerable stature when permitted to run up

to standards. They are generally the most abundant and of most prosperous growth in watery situations: they however will grow freely almost any where, in any common soil and exposure: but grow considerably faster and stronger in low moist land, particularly in marshy situations, by the verge of rivers, brooks, and other waters; which places, often lying waste, may be employed to good advantage in plantations of willows for different purposes.

SALLEE, a large walled sea-port on the coast of Morocco, situated in the province of Benihasen, at the mouth of a river of the same name. It was formerly the great hold of Moorish piracy, and immense depredations were committed from it upon European commerce.

SALLENGRE (Albert Henry de), F. R. S., an ingenious writer, born at the Hague in 1694. His father was receiver general of Walloon Flanders, and of an ancient family. He sent young Albert to Leyden, who, having finished his studies, commenced advocate in Holland. After the peace of Utrecht, in 1713, he travelled into France. In 1716 he was made counsellor to the princess of Nassau; in 1717 commissary of finances to the States. In 1719 he visited England, and was elected F. R. S. He wrote commentaries on Ovid's epistles and other classics; and was writing a History of the United Provinces, when he was cut off by the small pox in 1723.

SALLO (Denis de), a French writer, born in Paris in 1626. He studied the law, and was admitted a counsellor in the parliament of Paris in 1652. It was in 1664 he laid the plan of the *Journal des Sçavans*; and the year following began to publish it, under the name of *Sieur de Heronville*, which was that of his valet de Chambre. But he criticised so severely, and authors retorted so powerfully, that M. de Sallo, after he had published his third Journal, gave up the undertaking, delivering it over to the abbe Gallois; who, without presuming to criticise, contented himself merely with giving the titles of new books, and making extracts. M. de Sallo died in 1669.

SALLOW, *n. s.* Lat. *salix*. A tree of the genus of willow.

Sallows and reeds on banks of rivers born,
Remain to cut to stay thy vines. *Dryden*.

SALLOW, *adj.* } Belg. *zalow*; Teut.
SALLOWNESS, *n. s.* } *salo*, black. Sickly; yellow: the noun substantive corresponding.

What a deal of brine
Hath wash't thy *sallow* cheeks for Rosaline!
Shakspeare.

The scene of beauty and delight is changed:
No roses bloom upon my fading cheek,
Nor laughing graces wanton in my eyes;
But haggard Grief, lean-looking *sallow* Care,
And pining Discontent, a rueful train,
Dwell on my brow, all hideous and forlorn. *Rowe*.

A fish diet would give such a *sallowness* to the celebrated beauties of this island, as would scarce make them distinguishable from those of France.

Addison.

SALLUSTIUS (Caius Crispus), a celebrated Roman historian, born at Amiternum, in Italy, A. U. C. 669. His Roman History, in six

books, from the death of Sylla to the conspiracy of Catiline, the great work from which he chiefly derived his glory among the ancients, is unfortunately lost, excepting a few fragments; but the two detached pieces of his history which happily remain entire are sufficient to justify the great encomiums he has received as a writer. No man has inveighed more sharply against the vices of his age than this historian; yet no man had less pretensions to virtue. His youth was spent in a most lewd and profligate manner, and his patrimony rapidly squandered. Marcus Varro, a writer of undoubted credit, relates, in a fragment preserved by Aulus Gellius, that Sallustius was actually caught in bed with Fausta the daughter of Sylla, by Milo her husband; who scourged him very severely, and did not suffer him to depart till he had redeemed his liberty with a considerable sum. In A. U. C. 694 he was made questor, and in 702 tribune of the people; in neither of which places did he acquit himself with honor. By his questorship he obtained an admission into the senate; but was expelled by the censors in 704 on account of his debauched way of life. In 705 Cæsar restored him to the dignity of a senator, and made him questor a second time. In the administration of this office he behaved very scandalously. In 707, when the African war was at an end, he was made prætor for his services to Cæsar, and sent to Numidia. Here he outrageously plundered the province; and returned with such immense riches to Rome, that he purchased a magnificent building upon mount Quirinal, with those gardens which still retain the name of Sallustian gardens, besides his country house at Tivoli. Eusebius tells us that he married Terentia, the divorced wife of Cicero; and that he died at the age of fifty, A. U. C. 710, four years before the battle of Actium. Besides his histories of the Catilinarian and Jugurthine wars, we have some orations, printed with his fragments.

SALLY, *n. s. & v. a.* } Fr. *sallie*. Erup-
SALLYPORT. } tion; issue from a
place besieged; quick egress; escape: to make
such egress: a sally-port is a gate at which sal-
lies are made.

Now mote I weet,
Sir Guyon, why with so fierce *sallience*
And fell intent, y^e did at erst me meet.

Faerie Queene.

The Turks, *sallying* forth, received thereby great
hurt.

Knolles.

The episodical part, made up of the extravagant
sallies of the prince of Wales and Falstaff's humour,
is of his own invention. *Shakspeare. Illustrated.*

At his return all was clear, and this excursion was
esteemed but a *sally* of youth.

Wotton.

The deputy sat down before the town for the space
of three winter months; during which time *sallies*
were made by the Spaniards, but they were beaten
in with loss.

Bacon.

My slippery soul had quit the fort,
But that she stopped the *sallyport*.

Cleaveland.

Love to our citadel resorts
Through those deceitful *sallyports*;
Our sentinels betray our forts.

Denham.

'Tis but a *sally* of youth.

Id. Sophy.

These passages were intended for *sallies* of wit;
but whence comes all this rage of wit? *Stillingfleet.*

The noise of some tumultuous fight;
They break the truce and *sally* out by night.

Dryden.

Every one shall know a country better that makes
often *sallies* into it, and traverses it up and down,
than he that, like a mill-horse, goes still round in the
same track.

Locke.

We have written some things which we may wish
never to have thought on: some *sallies* of levity
ought to be imputed to youth.

Swift.

SALLY-PORTS, in fortification, or posterns as
they are sometimes called, are those under-
ground passages which lead from the inner
works to the outward ones; such as from the
higher flank to the lower, or to the tenailles, or
the communication from the middle of the cur-
tain to the ravelin. When they are made for
men to go through only, they are made with
steps at the entrance and going out. They are
about six feet wide, and eight feet and a half
high. There is also a gutter or shore made
under the sally ports, which are in the middle of
the curtains, for the water which runs down the
streets to pass into the ditch; but this can only
be done when they are wet ditches. When
sally-ports serve to carry guns through for the
out works, instead of making them with steps,
they must have a gradual slope, and be eight
feet wide. See FORTIFICATION.

SALMANASAR, or SALMANESER, the son
of Tiglath-pileser, king of Assyria, succeeded
his father, about A. M. 3276. He took Sama-
ria, put an end to the kingdom of Israel, and
carried the Israelites into captivity, A. M. 3283.
He was afterwards defeated by the Tyrians; and
died about A. A. C. 714. He was succeeded by
his son Sennacherib.

SALMASIUS (Claudius), a French writer of
great abilities and immense erudition, descended
from an ancient and noble family, and born at
or near Semur in 1596. His mother, who was
a Protestant, educated him in her own religious
opinions, and he at length converted his father.
He settled at Leyden; and in 1659 paid a visit
to Christina, queen of Sweden, who showed
him extraordinary marks of regard. Upon the
death of king Charles I. he was prevailed on by
the royal family, then in exile, to write a defence
of that king, which was answered by the cele-
brated Milton in 1651, in a work entitled *De-
fensio pro Populi Anglicano contra Claudii
Salmasii Defensionem Regiam*. This book was
read over all Europe; and conveyed such a
proof of the writer's abilities that he was re-
spected even by those who hated his political
principles. Salmasius died in 1653. His
works are numerous, and of various kinds; but
the greatest monuments of his learning are his
Notæ in Historiæ Augustæ Scriptores, and his
Exercitationes Plinianæ in Solinum.

SALMASIUS (Claudius), son of the preceding,
published the answer to Milton, which his father
had begun, but did not live to finish; and dedi-
cated it to king Charles II. in 1660.

SALMO, the salmon, in ichthyology, a genus
of the order of abdominales. The head is
smooth, and furnished with teeth and a tongue;
the rays of the gills are from four to ten; the
back-fin is fat behind, and the ventral fins have

many rays. There are many species, of which the most remarkable are the following:—

1. *S. albus*, the white, migrates out of the sea into the river Esk in Cumberland, from July to September. When dressed the flesh of these fish is red and most delicious eating. They have, on their first appearance from the salt water, the *lerna salmonea*, or salmon louse, adhering to them. They never exceed a foot in length. The upper jaw is a little longer than the lower; in the first are two rows of teeth, in the last one; on the tongue are six teeth. The back is straight, the whole body of an elegant form, the lateral line is straight; color, between that and the top of the back, dusky and silvery intermixed; beneath the line white; first dorsal fin spotted with black; tail black, and much forked.

2. *S. alpinus*, the red charr, is an inhabitant of the lakes of the north, and of those of the mountainous parts of Europe. It chooses clear and pure waters, and is very rarely known to wander into running streams. It is found in vast abundance in the cold lakes on the summits of the Lapland mountains, and is almost the only fish that is met with in any plenty in those regions. The larvæ of a species of gnat afford food to the fish, who in their turn are a support to the migratory Laplanders, in their summer voyages to the distant lakes. There are but few lakes in our island that produce this fish; and even those not in any abundance. It is found in Ullswater and Windermere in Westmoreland; in Llyn Quellyn, near the foot of Snowdon; and, before the discovery of the copper mines, in those of Llynberis; but the mineral streams have entirely destroyed the fish in the last lakes. In Scotland it is found in Loch Inch and other neighbouring lakes, and is said to go into the Spey to spawn. They are supposed to be in the highest perfection about May, and continue so all the summer; yet are rarely caught after April. When they are spawning in the river they will take a bait, but at no other time; being commonly taken, as well as the other species, in what they call breast-nets, which are in length about twenty-four fathoms, and about five where broadest. They are taken in greatest plenty from the end of September to the end of November. This species is much esteemed for the table, and is very delicate when potted.

3. *S. eperlanus*, the smelt, inhabits the seas of the northern parts of Europe, and is found as far south as the Seine. They are also taken in the Straits of Magellan, and of a most surprising size, some measuring twenty inches in length and eight in circumference. They inhabit the seas that wash these islands the whole year, except when they ascend the rivers. In certain rivers they appear a long time before they spawn, being taken in great abundance in November, December, and January, in the Thames and Dee, but in others not till February; and in March and April they spawn; after which they all return to the salt water, and are not seen in the rivers till the next season. They never come into the Mersey as long as there is any snow water in the river. These fish vary greatly in size; but the largest we ever heard of was thir-

teen inches long, and weighed half a pound. They have a very particular scent, whence is derived one of their English names, *smelt*, i. e. smell it. That of sparring, which is used in Wales and the north of England, is taken from the French *sperlan*. The fishing for smelts in the Thames is prohibited under heavy penalties, and the exertions of the magistrates have nearly put an end to it. The fish can hardly be purchased in London at any price however extravagant. It is a fish of a very beautiful form and color; the head is transparent, and the skin in general so thin that with a good microscope the blood may be observed to circulate. The irides are silvery; the pupil of a full black; the under jaw is the longest; in the front of the upper jaw are four large teeth; those in the sides of both are small; in the roof of the mouth are two rows of teeth; on the tongue two others of large teeth. The scales are small, and readily drop off; the tail consists of nineteen rays, and is forked. The color of the back is whitish, with a cast of green, beneath which it is varied with blue, and then succeeds a beautiful gloss of a silvery hue.

4. *S. fario*, the trout: the colors of which vary greatly in different waters, and in different seasons. Trout differ also in size. The stomachs of the common trout are uncommonly thick and muscular. They feed on the shell-fish of lakes and rivers, as well as on small fish. They likewise take into their stomachs gravel or small stones, to assist in comminuting the testaceous parts of their food. The trout of certain lakes in Ireland, such as those of the province of Galway and some others, are remarkable for the great thickness of their stomachs, which, from some slight resemblance to the organs of digestion in birds, have been called gizzards; the Irish name the species that has them gillaroo trout. These stomachs are sometimes served up to table alone, under the appellation of gillaroo. Trout are most voracious fish, and afford excellent diversion to the angler. Trout shift their quarters to spawn; and like salmon make up towards the heads of rivers to deposit their roes. The under jaw of the trout is subject, at certain times, to the same curvature as that of the salmon. Trout are caught in very great plenty at all seasons of the year; one weighing a pound and a half is a usual size, though some are caught of four pound weight. Five or six ounces is a common weight; the largest are commonly the best for the table, when a deep salmon color. In winter great quantities are potted along with the charr, and sent to London, &c. Geld fish (those without spawn) are the firmest and best.

5. *S. lavaretus*, the gwyniad, is an inhabitant of several of the lakes of the Alpine parts of Europe. It is found in those of Switzerland, Savoy, and Italy; of Norway, Sweden, Lapland, and Scotland; in those of Ireland and of Cumberland; and in Wales, in that of Llyntegid, near Bala, in Merionethshire. It is the same with the *ferra* of the lake of Geneva; the *schelly* of Hulsewater; the pollen of Loch Neah; and the *vangis* and *juvengis* of Loch Mbaon. It is said to have been first introduced into Scotland by queen Mary; and as in her time the Scottish

court was much Frenchified, the name was perhaps derived from the French *vendois*, a dace; to which a slight observer might be tempted to compare it by the whiteness of its scales. The British name *gwyniad* or *whiting* was bestowed upon it for the same reason. It is a gregarious fish, and approaches the shores in vast shoals in spring and in summer; which proves in many places a relief to the poor of inland countries, as the annual return of the herring is to those who inhabit the coasts. Between 7000 and 8000 have been taken at one draught. The whiting is a fish of an insipid taste, and must be eaten soon, for it will not keep long; those that choose to preserve them do it with salt. They die very soon after they are taken. Their spawning season in Llyntegid is in December. The largest whiting we ever heard of weighed between three and four pounds; the head is small, smooth, and of a dusky hue; the eyes very large; the pupil of a deep blue; the nose blunt at the end; the jaws of equal length; the mouth small and toothless; the branchiostegous rays nine; the covers of the gills silvery, powdered with black. The back is a little arched, and slightly carinated; the color, as far as the lateral line, is glossed with deep blue and purple; but towards the lines assumes a silvery cast, tinged with gold; beneath which those colors entirely prevail. The tail is very much forked; the scales are large, and adhere close to the body.

6. *S. salar*, the common salmon, is a northern fish, being unknown in the Mediterranean Sea and other warm climates; it is found in France in some of the rivers that fall into the ocean, and north as far as Greenland; they are also very common in the northern parts of North America. They are in several countries a considerable article of commerce; they are stationary fisheries in Iceland, Norway, and the Baltic; and in Great Britain, on the Tweed, at Berwick, and in various rivers of Scotland. See our article *FISHERIES*. In Cumberland they go up the river Derwent in September, through the lake of Bassenthwaite, up the river which runs through Keswick into the Vale of St. John, where they deposit their spawn in the small streams and feeders of the lake. The young salmon are called salmon smelts, and go down to the sea with the first floods in May. The salmon was known to the Romans, but not to the Greeks. Pliny speaks of it as a fish found in the rivers of Aquitaine: Ausonius enumerates it among those of the Moselle. The salmon is a fish that lives both in the salt and fresh waters; quitting the sea at certain seasons for the sake of depositing its spawn, in security, in the gravelly beds of rivers remote from their mouths. There is scarcely any difficulties but what they will overcome to arrive at places fit for their purpose; they will ascend rivers hundreds of miles, force themselves against the most rapid streams, and spring with amazing agility over cataracts of several feet in height. Salmon are frequently taken in the Rhine as high up as Basil; they gain the sources of the Lapland rivers in spite of their torrent like currents, and surpass the perpendicular falls of Leikslip, Kennerth, and Pont Aberglastyn. The salmon is so generally known that a very brief descrip-

tion will serve. It has been known to weigh seventy-four pounds. The color of the back and sides is gray, sometimes spotted with black, sometimes plain; the covers of the gills are subject to the same variety; the belly silvery; the nose sharp-pointed; the end of the under jaw in the males often turns up in the form of a hook; sometimes this curvature is very considerable; it is said that they lose this hook when they return to the sea. The teeth are lodged in the jaws and on the tongue, and are slender but very sharp; the tail is a little forked. When the fish enter the Friths, or mouths of the rivers, at the commencement of their upward migration, and are thus in good condition, they are termed, in the language of fishermen, *clean fish*. At this period they are infested with the salmon louse, *caligus productus* of naturalists, and which chiefly adhere to the more insensible parts. But when arrived at the place of spawning, the fish is lean, as the whole fat of the body has passed into the melt and the roe. In this state, in which they are termed *red fish*, they are worthless as an article of food. After the fish have spawned they are termed *kelts* or *foul fish*, and are equally despised with the red fish. The gills are now more or less covered with the *entomoda salmonea*. The motion of the fish upwards from the sea to the river and place of spawning is influenced by several causes. When there is abundance of fresh water in the Friths the fish seem to proceed regularly and rapidly up the middle of the stream, enter the rivers, and hasten on to their destination. In returning to the sea, after spawning, the fish seem to keep the middle of the stream in the river, and the deepest and saltiest water in the Friths. Salmon enter the river at all seasons of the year, but they approach in greatest numbers during the summer months. Fish taken in May, June, and July, are much fatter than fish in the same condition as to spawning, taken in February, March, or April. They fall off in fatness very rapidly from August to January, when they are leanest. The principal spawning season is in November, December, and January. See *FISHERIES*. Salmon fisheries, Marshal observes, are 'copious and constant sources of human food; they rank next to agriculture. They have indeed one advantage over every other internal produce: their increase does not lessen other articles of human sustenance. The salmon does not prey on the produce of the soil, nor does it owe its size and nutritive qualities to the destruction of its compatriot tribes. It leaves its native river at an early state of growth; and, going even naturalists know not where, returns of ample size, and rich in human nourishment; exposing itself in the narrowest streams, as if nature intended it as a special boon to man. In every stage of savageness and civilisation the salmon must have been considered as a valuable benefaction to this country.' From the extremity of the Highlands, and from the Orkney and Shetland Islands, these fish are sent up to the London market in ice; and when the season is at its height, and the catch more than can be taken off hand fresh, they are then salted, pickled, or dried, for winter consumption at home, and for the foreign markets. Perhaps the fishery of

the Tweed is the first in point of quantity caught, which is sometimes quite astonishing, several hundreds being taken at a single draught of the net. Formerly it was all pickled and kilted, after being boiled, and sent to London under the name of Newcastle salmon; but the present mode has so raised the value of the fish as nearly to have banished this article of food from the inhabitants in the environs of the fishery, except as an expensive luxury. Within memory, salted salmon formed a material article of economy in all the farm houses of the vale of Tweed, inasmuch that indoor servants often bargained that they should not be obliged to take more than two weekly meals of salmon. It could then be bought at 2s. the stone, of nineteen pounds weight; it is now never below 12s., often 36s., and sometimes two guineas.

7. *S. thymallus*, the umber, or grayling, haunts clear and rapid streams, and particularly those that flow through mountainous countries. It is found in the rivers of Derbyshire; in some of those of the north; in the Tame near Ludlow; in the Lug, and other streams near Leominster. It is also very common in Lapland; the inhabitants make use of the entrails of this fish instead of rennet, to make the cheese which they get from the milk of the rein deer. It is a voracious fish, rises freely to the fly, and will very eagerly take a bait. It is a very swift swimmer, and disappears like the transient passage of a shadow, whence it derived the name of umbra.

8. *S. trutta*, the sea trout, migrates like the salmon up several of our rivers, spawns, and returns to the sea. The shape is more thick than the common trout; the irides silver; the head thick, smooth, and dusky, with a gloss of blue and green; the back of the same color, which grows fainter towards the side line. The back is plain, but the sides, as far as the lateral line, are marked with large distinct irregular-shaped spots of black; the lateral line straight; the sides beneath the line and the belly are white. Tail broad, and even at the end. The flesh when boiled is of a pale red, but well flavored.

SALMON, *n. s.* Lat. *salmo*; Fr. *saumon*. A well-known fish.

They poke them with an instrument somewhat like the salmon spear. *Carew's Survey of Cornwall.*

They take salmon and trouts by groping and tickling them under the bellies in the pools, where they hover, and so throw them on land. *Carew.*

Of fishes, you find in arms the whale, dolphin, salmon, and trout. *Peacham.*

The salmon is accounted the king of fresh water fish, and is bred in rivers relating to the sea, yet so far from it as admits no tincture of brackishness. Sir Francis Bacon observes the age of a salmon exceeds not ten years. After he is got into the sea he becomes from a samlet, not so big as a gudgeon, to be a salmon in as short a time as a gosling becomes a goose. *Walton's Angler.*

There is in many rivers that relate to the sea salmon trouts as much different from others, in shape and spots, as sheep differ in their shape and bigness. *Id.*

SALMON, in ichthyology. See SALMO, No. 6. SALMON FISHERY, &c. See FISHERY.

SALMON (Nathaniel), a celebrated English divine, physician, and antiquarian, was the son

of the Rev. Thomas Salmon, M. A., rector of Mepsall. He was admitted of Benet College, Cambridge, June 11th, 1690, and took the degree of LL. D. in 1695. He then entered into orders, and became curate of Westmill, in Hertfordshire; but, although he had taken the oaths to king William III., he refused to do so to queen Anne; and, being therefore turned out of his cure, he studied physie, and practised at St. Ives and Bishop's Stortford. He was married, and left three daughters. He published, 1. A Survey of the Roman Antiquities in the Midland counties of England; in 8vo., 1726. 2. A Survey of the Roman Stations in Britain, according to the Roman Itinerary; 8vo., 1728. 3. The History of Hertfordshire, &c., fol., 1728. 4. The Lives of the English Bishops from the Restoration to the Revolution; 1733. 5. The Antiquities of Surrey, &c., 8vo., 1736. 6. The History and Antiquities of Essex, folio. This work was left unfinished at his death, in 1738.

SALMON (Thomas), an eminent English historian and geographer, younger brother to the Dr. He wrote many useful works, particularly, 1. A Geographical Grammar; 8vo., which went through numberless editions. 2. A History of England. 3. An examination of Bishop Burnet's History of his own times. He died in April 1743.

SALMONE, a town of Peloponnesus, in Elis, with a fountain, forty stadia from Olympia; thence called Salmonis.

SALMONEUS, in fabulous history, a king of Elis, the son of Æolus and Enarete, and brother of Sisyphus. He married Alcideia by whom he had Tyro. Ambitious to be reckoned a god, he imitated thunder and lightning by artificial fireworks. Jupiter therefore struck him with a real thunderbolt, and placed him in hell near his brother Sisyphus.

SALON, a town in the south-east of France, in Provence, department of the mouths of the Rhone. It is situated on a height, on the canal of Capronne, and its trade consists in the produce of the neighbouring country, viz. corn, cattle, wool, olives and silk. Inhabitants 6300. Eighteen miles W. N. W. of Aix, and nineteen east of Arles.

SALONA, a town of Austrian Dalmatia, on a bay of the Adriatic, once a town of importance, having been taken and destroyed in the reign of Augustus, but rebuilt by Tiberius, who sent thither a Roman colony, and made it the capital of Illyricum. This rank it long held; but seems to have declined after the reign of Dioclesian. Two miles north-east of Spalatro.

SALONA, a considerable town of Livadia, near a bay called the gulf of Salona, which is an inlet from the gulf of Corinth. Salona is situated in a fertile and highly cultivated plain, at the foot of mount Parnassus, and is supposed to occupy the site of the ancient Amphissa. The modern town has no fortifications. Its population is estimated at 8000, and its trade is considerable. Salona is the see of a bishop, subject to the archbishop of Athens. Forty-eight miles north-east of Lepanto.

SALONICA anciently called Thessalonica, Hallia, and Therma, a large and handsome city

of Macedon, standing at the northern extremity of a great bay, and on the acclivity of a steep hill, which rises from the bay at its north-east extremity. The circumference of the walls is about five miles, and the fortress has seven towers. The domes and minarets of mosques are seen rising from among the other buildings, environed by cypresses, and giving a general air of splendor to the place. In ancient times this was a comparatively small place, and is indebted for its increase to the advantage of its position. With the country to the north, one of the most fertile districts in Macedon, it communicates by land, or by the river Vardari, the ancient Axios. The articles collected in Salonica, viz. cotton, tobacco, corn, and wool, are exported to different parts of Europe. The Turks never carried on much business here; it is in the hands of Greeks, Jews, and Frank or French, Italian, English, or Dutch merchants, all of whom have consuls here. The population is computed at 70,000.

Salonica has few antiquities, except the propylæa of the ancient Hippodrome, the alto-relievos on which are represented in a series of beautiful and accurate engravings, in Stuart's Antiquities of Athens. 272 miles west of Constantinople, and 252 E. S. E. of Ragusa. Long. 22° 56' E., lat. 40° 38' 7" N.

SALONINA, the wife of the emperor Gallienus, eminent for her public and private virtues. She patronised the arts and sciences, and to her Rome was greatly indebted for a short period of prosperity. But her virtues could not preserve her from the murderers of her husband, who assassinated both, A. D. 268.

SALSETTE, an island on the western coast of Hindostan, and province of Aurungabad, formerly separated from Bombay by a strait 200 yards wide, across which, in the year 1805, a causeway was carried. This island is eighteen miles long, by fourteen broad, and is well adapted for sugar, cotton, hemp, indigo, &c.; but it has hitherto been kept in a state of nature, for the purpose of supplying Bombay with wood, charcoal, and sea salt. Salsette is remarkably rich in antiquities, and the remains of reservoirs, with flights of stone steps round them, the ruins of temples, &c. The most remarkable object, however, is the caverns at Kennere, which contain two colossal statues of Boodh. One of these was converted by the Portuguese into a church. In 1773, during a rupture with the Maharrattas, it was occupied by the British troops, and has ever since remained in their possession. Janna is the chief town.

SAL'SIFY, *n. s.* A plant.

Sal'sify, or the common sort of goatsbeard, is of a very long oval figure, as if it were cuds all over streaked, and engraven in the spaces between the streaks, which are sharp-pointed towards the end.

Mortimer's Husbandry.

SALSOACID, *n. s.* Lat. *salsus* and *acidus*. Having a taste compounded of saltiness and sourness.

The distinction of salts, whereby they are discriminated into acid, volatile, or *salsuginous*, if I may so call the fugitive salts of animal substances, and fixed or alcalizate, may appear in much use in natural philosophy.

Boyle.

The *salsoacids* help its passing off; as *sal prunel.* *Floyer.*

SALSOLA, glass-wort; a genus of the digynia order, and pentandria class of plants, natural order twelfth, holoracæ: *CAL.* pentaphyllous: *CAPS.* monospermous, with a screwed seed. The species are these:—

1. *S. kali*, growing naturally in the salt marshes in divers parts of England. It is an annual plant, which rises above five or six inches high, sending out many side branches, which spread on every side, garnished with short awl-shaped leaves, which are fleshy, and terminate in acute spines. The flowers are produced from the side of the branches, to which they sit close, and are encompassed by short prickly leaves; they are small, and of an herbaceous color. The seeds are wrapped up in the empalement of the flower, and ripen in autumn; soon after which the plant decays.

2. *S. rosacea*, growing naturally in Tartary, is an annual plant, whose stalks are herbaceous, and seldom rise more than five or six inches high. The leaves are awl-shaped, ending in acute points; the empalements of the flowers spread open; the flowers are small, and of a rose color, but soon fade; the seeds are like those of the other kinds.

3. *S. soda* rises with herbaceous stalks, nearly three feet high, spreading wide. The leaves on the principal stalk, and those on the lower part of the branches, are long, slender, and have no spines; those on the upper part of the stalk and branches are slender, short, and crooked. At the base of the leaves are produced the flowers, which are small and hardly perceptible; the empalement of the flower afterwards encompasses the capsule, which contains one cochleated seed. All the sorts of glass-wort are sometimes promiscuously used for making kali, but this species is esteemed best. The manner of making it is as follows:—Having dug a trench near the sea, they place laths across it, on which they lay the herbs in heaps; and, having made a fire below, the liquor which runs out of the herbs drops to the bottom, which at length thickening, becomes kali, which is partly of a black, and partly of an ash color, very sharp and corrosive, and of a saltish taste. This, when thoroughly hardened, becomes like a stone; and in that state is transported to different countries for the making of glass.

4. *S. stragus* grows naturally on the sandy shores of the south of France, Spain, and Italy. This is also an annual plant, which sends out many diffused stalks, garnished with linear leaves an inch long, ending with sharp spines. The flowers come out from the side of the stalks in the same manner as those of the former; their empalements are blunt, and not so closely encompassed with leaves as those of the other.

5. *S. vermiculata* grows naturally in Spain. This has shrubby perennial stalks, which rise three or four feet high, sending out many side branches, garnished with fleshy, oval, acute pointed leaves, coming out in clusters from the side of the branches, they are hoary, and have stiff prickles. The flowers are produced from between the leaves toward the end of the

branches; they are so small as scarcely to be discerned unless they are closely viewed. The seeds are like those of the other kinds.

SALT, *n. s., adj., & v. a.* } Saxon *realt*;
SALT-CAT, *n. s.* } Goth., Swed., and
SALT-CELLAR, } Dan. *salt*; Fr. *sel*;
SALTER, } Lat. *sal*. A well
SALTERN, } known combina-
SALTPETRE. } tion of an acid

with an alkali, earth, or metallic oxide: impregnated with, or abounding in salt. See CHEMISTRY, and below. Taste; smack; relish; wit: to season with salt: a salt-cat is a name for a lump of salt, see below: salt-cellar, the vessel that usually holds the salt: saltern, a salt-pan or work: saltish, salty, and saltiness, correspond: saltpetre (Lat. *sal petrae*) nitre.

He shall inhabit the parched places in the wilderness in a salt land, and not inhabited.

Jer. xvii. 6.

Moab and Ammon shall be as the breeding of nettles, salt-pits, and a perpetual desolation.

Zech. ii. 9.

Is not discourse, manhood, learning, gentleness, virtue, and liberality, the spice and salt that seasons a man?

Shakspeare.

Though we are justices and doctors, and churchmen, Mr. Page, we have some salt of our youth in us; we are the sons of women.

Id. Merry Wives of Windsor.

We were better parch in Africk sun,
Than in the pride and salt scorn of his eyes.

Shakspeare.

Thou old and true Menenius,
Thy tears are saltier than a younger man's,
And venomous to thine eyes.

Id. Coriolanus.

Be a whole still:
Make use of thy salt hours, season the slaves
For tubs and baths; bring down the rose-checked youth

To the tub-fast and the diet.

Id. Timon.

This new-married man, approaching here,
Whose salt imagination yet hath wronged
Your well-defended honour, you must pardon.

Shakspeare.

After these local names, the most have been derived from occupations; as smith, *salter*, armourer.

Camden's Remains.

Some think their wits have been asleep, except they dart out somewhat that is piquant and to the quick; men ought to find the difference between saltiness and bitterness.

Bacon.

Cicero prettily calls them *salinas salt-pans*, that you may extract salt out of, and sprinkle where you please.

Id.

It hath been observed by the ancients, that salt water will dissolve salt put into it in less time than fresh water.

Id.

Nitre, or *saltpetre*, having a crude and windy spirit, by the heat of the fire suddenly dilateth.

Id.

If the offering was of flesh, it was salted thrice.

Browne.

Since salts differ much, some being fixt, some volatile, some acid, and some urinous, the two qualities wherein they agree are, that it is easily dissolvable in water, and affects the palate with a savour good or evil.

Boyle.

Nitre or *saltpetre*, in heaps of earth, has been extracted, if they be exposed to the air, so as to be kept from rain.

Locke.

Soils of a saltish nature improve sandy ground.

Mortimer.

In Cheshire they improve their lands by letting

out the water of the salt springs on them, always after rain.

Id.

Many give a lump of salt, which they usually call a *salt-cat*, made at the *saltern*, which makes the pigeons much affect the place.

A leap into salt waters very often gives a new motion to the spirits, and a new turn to the blood.

Addison.

A particle of salt may be compared to a chaos, being dense, hard, dry, earthy in the centre, and rare, soft, and moist in the circumference.

Newton's Opticks.

The stratum lay at about twenty-five fathoms, by the duke of Somerset's salt-pans near Whitehaven.

Woodward on Fossils.

Salts are bodies friable and brittle, in some degree pellucid, sharp or pungent to the taste, and dissolvable in water; but, after that is evaporated, incorporating, crystallising, and forming themselves into angular figures.

Woodward.

When any salt is spilt on the table-cloth, shake it out into the saltcellar.

Swift's Directions to the Butler.

SALT is distinguished by some into three kinds: native or rock salt; common, or sea salt, or white salt; and bay salt.

SALT, BAY. Under the title of bay salt are ranked all kinds of common salt extracted from the water wherein it is dissolved, by means of the sun's heat, and the operation of the air; whether the water from which it is extracted be sea water, or natural brine drawn from wells and springs, or salt water stagnating in ponds and lakes. It does not appear that there is any other thing requisite in the formation of bay salt, than to evaporate the sea water with an exceeding gentle heat; and it is even very probable that our common sea salt by a second solution and crystallisation might attain the requisite degree of purity.

SALT, COMMON, or sea salt, or white salt, the name of that salt extracted from the waters of the ocean, which is used in great quantities for preserving provisions, &c. It is composed of muriatic acid, saturated with soda; and hence, in the new chemical nomenclature, it is called muriate of soda. See CHEMISTRY, Index. It is commonly found in salt water and salt springs, in the proportion of thirty-six per cent. It is found also in coals and in beds of gypsum. Of this most useful commodity there are ample stores on land as well as in the ocean. There are few countries which do not afford vast quantities of rock or fossil salt. Mines of it have long been discovered and wrought in England, Spain, Italy, Germany, Hungary, Poland, and other countries of Europe. In several parts of the world there are huge mountains which wholly consist of fossil salt. Of this kind are two mountains in Russia, near Astracan; several in the kingdoms of Tunis and Algiers, in Africa; and several also in Asia; and the whole island of Ormus in the Persian gulf almost entirely consists of fossil salt. The new world is likewise stored with treasures of this useful mineral, as well as with all other kinds of subterranean productions. The sea affords such vast plenty of common salt, that all mankind might thence be supplied with quantities sufficient for their occasions. There are also innumerable springs,

ponds, lakes, and rivers, impregnated with common salt, from which the inhabitants of many countries are plentifully supplied therewith. In some countries which are remote from the sea, and have little commerce, and which are not blessed with mines of salt or salt waters, the necessities of the inhabitants have forced them to invent a method of extracting their common salt from the ashes of vegetables. And the ingenious Dr. Fothergill extracted plenty of it from the ashes of fern. See *Medical Essays*, vol. v. article 13. Mr. Boyle discovered common salt in human blood and urine. 'I have observed it,' says Mr. Brownrigg, 'not only in human urine, but also in that of dogs, horses, and black cattle. It may easily be discovered in these, and many other liquids impregnated with it, by certain very regular and beautiful starry figures which appear in their surfaces after congelation. These figures I first observed in the great frost in 1739. The dung of such animals as feed upon grass or grain doth also contain plenty of common salt.' Naturalists, observing the great variety of forms under which this salt appears, have thought fit to rank the several kinds of it under certain general classes; distinguishing it, more usually, into rock, or fossil salt, sea salt, and brine or fountain salt. To which classes others might be added, of those muriatic salts which are found in animal and vegetable substances. These several kinds of common salt often differ from each other in their outward form and appearance, or in such accidental properties as they derive from the heterogeneous substances with which they are mixed. But, when perfectly pure, they have all the same qualities; so that chemists, by the exactest enquiries, have not been able to discover any essential difference between them. Immense masses of it are found in different countries, which require only to be dug out and reduced to powder. In this state it is called rock salt. The water of the ocean also contains a great proportion of this salt, to which indeed it owes its taste, and the power it possesses of resisting freezing till cooled down to zero. When this water is evaporated sufficiently, the salt precipitates in crystals. It is by this process that it is obtained in this country. But the salt of commerce is not sufficiently pure for the purposes of chemistry, as it contains usually muriate of lime, &c.; but it may be obtained pure by the following process:—Dissolve it in four times its weight of pure water, and filter the solution. Drop into it a solution of carbonate of soda, as long as any precipitate continues to fall. Separate the precipitate by filtration, and evaporate slowly till the salt crystallises. Muriate of soda usually crystallises in cubes, which, according to Haüy, are the primitive form of its crystals and its integrant particles. It is the most common and most useful seasoner of food; it preserves meat from putrefaction, and butter from rancidity; it serves for an enamel to the surfaces of coarse stone ware; it is an ingredient in many processes of dyeing; metallurgists use it in many of their essays. Its utility in chemistry is equally extensive. From it muriatic and oxy-muriatic acids are obtained; and from it also of late great

quantities of soda have been extracted, and introduced with advantage as a substitute for the soda formerly obtained from the combustion of vegetables. The acid is easily extracted from this salt by means of sulphuric acid; but to obtain the alkali at a cheap rate is not so easy. The methods which have hitherto succeeded may be reduced to two:—1. Muriate of soda may be decomposed by some substance which has a stronger affinity for muriatic acid than soda has. The soda by this process is set at liberty, and may be obtained by evaporation and crystallisation. There are three substances capable of setting the base of common salt at liberty, and of furnishing soda, either pure or in the state of carbonate. These are litharge, lime, and iron. When about four parts of litharge and one of common salt, properly pounded and mixed, are macerated in a little water for several hours and stirred repeatedly, the muriatic acid gradually combines with the oxide of lead, and forms a muriate, while the soda is left in solution, and may be obtained separately by filtration and evaporation. The decomposition goes on still more rapidly, if the mixture be heated during the process. That the alkali may be extracted from common salt by lime is a fact, for which we are indebted to Scheele. Cahausen indeed had hinted at it in 1717, but his treatise had been forgotten. Scheele ascertained that a mixture of lime and common salt, formed into a paste, and placed in a moist cellar, was covered with an efflorescence of soda in fifteen days. Berthollet has rendered it probable that the soda which is found abundantly in the west of Egypt is formed naturally by a similar process. To Scheele likewise we owe the discovery that common salt may be decomposed by iron. He observed that a wooden vessel, placed in a cellar, and containing brine, had its iron hoops covered with an efflorescence of soda. This induced him to dip a plate of iron into a solution of common salt, and to suspend it in a cellar. After an interval of fourteen days, he found his iron incrustated with soda. The same decomposition takes place also if zinc or copper be substituted for iron. 2. The second method of extracting soda from common salt is less direct. It consists in displacing the muriatic by some other acid, which may be afterwards easily decomposed or displaced; thus the soda is left behind at last, in a state of purity. The acids which have been made use of are the sulphuric and acetous; the boracic, phosphoric, and arsenic acids might indeed be employed, as they decompose common salt in a high temperature. The products in that case would be borat, or the phosphate or arseniate of the same base, according to the acid. These salts might be afterwards decomposed by lime, and the soda obtained separate. But these acids are a great deal too high priced to admit of their employment. Sulphuric acid may be either employed in a separate state, or in combination with bases, when the salts which it then forms can be procured at a sufficiently cheap rate. Alum, sulphate of lime, and sulphate of iron, have been respectively employed with advantage to decompose common salt, and obtain sulphate of soda,

Alum was first employed for that purpose by Constantini, a physician of Melle near Osnaburgh, about 1650. The process does not succeed but at a low temperature. Sulphate of lime decomposes common salt when formed with it into balls, and exposed to a strong heat. Much discussion has taken place among the German chemists about the possibility of decomposing common salt by sulphate of iron. That sulphate of soda may be obtained by exposing a mixture of these two salts to a strong heat was first announced by Vander Ballen. This was contradicted by Hahneman, but confirmed by the experiments of Tuhten, Lieblein, and Wiegleb. It succeeded completely with the French commissioners, De Lievre, Pelletier, Darcey, and Girond, who were appointed, in 1794, to examine the different processes for obtaining soda from common salt. They ascertained also that pyrites or sulphureted oxide of iron may be employed for the same purpose. After obtaining the sulphate of soda it is necessary to expel the acid, to obtain the soda separately. This is done by calcining the salt mixed with a certain proportion of charcoal or pit-coal. By this process it is converted into sulphuret of soda, and the sulphur may be abstracted by the intervention of iron or chalk. When the sulphuret of soda is nearly in fusion, small bits of iron (the parings of tin-plate answer best) are thrown in gradually in sufficient quantity to decompose the sulphate. The fire is raised till the mixture melts. The iron, having a stronger affinity for the sulphur, combines with it, and leaves the soda, which may be separated by solution in water, filtration, and evaporation.

SALT, COMMON, METHOD OF PREPARING. Without entering into any particular detail of the processes used for the preparation of bay salt, in different parts of the world, we shall only give a brief account of the best methods of preparing common salt. At some convenient place near the sea-shore is erected the saltern. This is a long low building, consisting of two parts; one of which is called the fore-house, and the other the pan-house or boiling-house. The fore-house serves to receive the fuel, and cover the workmen; and in the boiling-house are placed the furnace and pan, in which the salt is made. Sometimes they have two pans, one at each end of the saltern; and the part appropriated for the fuel and workmen is in the middle. The furnace opens into the fore-house by two mouths, beneath each of which is a mouth to the ash-pits. To the mouths of the furnace doors are fitted; and over them a wall is carried up to the roof, which divides the fore-house from the boiling-house, and prevents the dust of the coal and the ashes, and smoke of the furnace from falling into the salt pan. The fore-house communicates with the boiling-house by a door placed in the wall which divides them. The body of the furnace consists of two chambers, divided from each other by a brick partition called the mid-feather; which from a broad base terminates in a narrow edge nigh the top of the furnace, and, by means of short pillars of cast iron erected upon it, supports the bottom of the salt pan: it also fills up a considerable part of the furnace,

which otherwise would be too large, and would consume more coals than by the help of this contrivance are required. To each chamber of the furnace is fitted a grate, through which the ashes fall into the ash-pits. The grates are made of long bars of iron, supported underneath by strong cross bars of the same metal. They are not continued to the farthest part of the furnace, it being unnecessary to throw in the fuel so far; for the flame is driven from the fire on the grate to the farthest part of the furnace, and thence passes, together with the smoke, through two flues into the chimney; and thus the bottom of the salt pan is every where equally heated. The salt pans are made of an oblong form, flat at the bottom, with the sides erected at right angles: the length of some of these pans is fifteen feet, the breadth twelve feet, and the depth sixteen inches; but at different works they are of different dimensions. They are commonly made of plates of iron, joined together with nails, and the joints are filled with a strong cement. Within the pan five or six strong beams of iron are fixed to its opposite sides at equal distances, parallel to each other and to the bottom of the pan, from which they are distant about eight inches. From these beams hang down strong iron hooks, which are linked to other hooks or clasps of iron firmly nailed to the bottom of the pan; and thus the bottom of the pan is supported, and prevented from bending down or changing its figure. The plates most commonly used are of malleable iron, about four feet and a half long, a foot broad, and the third of an inch in thickness. The Scots prefer smaller plates, fourteen or fifteen inches square. Several make the sides of the pan, where they are not exposed to the fire, of lead; those parts, when made of iron, being found to consume fast in rust from the steam of the pan. Some have used plates of cast iron, five or six feet square, and an inch in thickness; but they are very subject to break when unequally heated, and shaken (as they frequently are) by the violent boiling of the liquor. The cement most commonly used to fill the joints is plaster made of lime. The pan thus formed is placed over the furnace, being supported at the four corners by brick work, but along the middle, and at the sides and ends, by round pillars of cast iron, called taplins, which are placed at three feet distance from each other, being about eight inches high, and at the top, where smallest, four inches in diameter. By means of these pillars the heat of the fire penetrates equally to all parts of the bottom of the pan, its four corners only excepted. Care is also taken to prevent the smoke of the furnace from passing into the boiling-house, by bricks and strong cement, which are closely applied to every side of the salt pan. In some places, as at Blyth in Northumberland, besides the common salt-pans here described, they have a preparing pan placed between two salt-pans, in the middle part of the building, which in other works is the fore-house. The sea-water, being received into this preparing pan, is there heated and in part evaporated by the flame and heat conveyed under it through flues from the two furnaces of the salt-pans; and the hot water, as occasion requires, is con-

veyed through troughs from the preparing pan into the salt-pans. Various other contrivances have been invented to lessen the expense of fuel, and several patents have been obtained for that purpose; but the salt-boilers have found their old methods the most convenient. Between the sides of the pan and walls of the boiling-house there runs a walk five or six feet broad, where the workmen stand when they draw the salt, or have any other business in the boiling-house. The same walk is continued at the end of the pan, next to the chimney; but the pan is placed close to the wall at the end adjoining to the fore-house. The roof of the boiling-house is covered with boards fastened on with nails of wood, iron nails quickly mouldering into rust. In the roof are several openings to convey off the watery vapors; and on each side of it a window or two, which the workmen open when they look into the pan whilst it is boiling. Not far distant from the saltern on the sea-shore, between full sea and low-water marks, they also make a little pond in the rocks, or with stones on the sand, which they call their sump. From this pond they lay a pipe, through which, when the tide is in, the sea-water runs into a well adjoining to the saltern; and from this well they pump it into the troughs, by which it is conveyed into their ship or cistern, where it is stored up until they have occasion to use it. The cistern is built close to the saltern, and may be placed most conveniently between the two boiling-houses, on the back side of the fore-house; it is made either of wood or brick and clay: it sometimes wants a cover, but ought to be covered with a shed, that the salt-water contained therein may not be weakened by rains, nor mixed with soot and other impurities. It should be placed so high that the water may conveniently run out of it through a trough into the salt pans. Besides the buildings already mentioned, several others are required; as store-houses for the salt cisterns for the bitter, an office for his majesty's salt-officers, and a dwelling-house for the salt-boilers. All things being thus prepared, and the sea-water having stood in the cistern till the mud and sand are settled to the bottom, it is drawn off into the salt-pan. And at the four corners of the salt-pan, where the flame does not touch its bottom, are placed four small lead pans, called scratch-pans, which, for a salt-pan of the size above-mentioned, are usually about a foot and a half long, a foot broad, and three inches deep; and have a bow or circular handle of iron, by which they may be drawn out with a hook when the liquor in the pan is boiling. The salt-pan being filled with sea-water, a strong fire of pit-coal is lighted in the furnace; and then, for a pan which contains about 400 gallons, the salt-boiler takes the whites of three eggs, and incorporates them well with two or three gallons of sea-water, which he pours into the salt-pan while the water contained therein is only lukewarm; and immediately stirs it about with a rake, that the whites of the eggs may every where be equally mixed with the salt water. Instead of whites of eggs, at many salterns, as at most of these near Newcastle, they use blood from the butchers, either of sheep or black cattle, to clarify the seawater; and at many others they do not give

themselves the trouble of clarifying it. As the water grows hot, the whites of eggs separate from it a black frothy scum, which arises to the surface of the water, and covers it all over. As soon as the pan begins to boil this scum is all risen, and it is then time to skim it off. The most convenient instruments for this purpose are skimmers of thin ash boards, six or eight inches broad, and so long that they may reach above half way over the salt-pan. These skimmers have handles fitted to them; and the salt-boiler and his assistant, each holding one of them on the opposite sides of the pan, apply them so to each other that they overlap in the middle, and, beginning at one end of the pan, carry them gently forward together, along the surface of the boiling liquor to the other end; and thus, without breaking the scum, collect it all to one end of the pan, from whence they easily take it out. After the water is skimmed, it appears perfectly clear and transparent; and they continue boiling it briskly, till so much of the fresh or aqueous part is evaporated that what remains in the pan is a strong brine almost fully saturated with salt, so that small saline crystals begin to form on its surface; which operation, in a pan filled fifteen inches deep with water, is usually performed in five hours. The pan is then filled up a second time with clear sea-water drawn from the cistern; and, about the time when it is half filled, the scratch-pans are taken out, and, being emptied of the scratch found in them, are again placed in the corners of the salt-pan. The scratch taken out of these pans is a fine white calcareous earth found in the form of powder, which separates from the sea-water during its coction, before the salt begins to form in grains. This subtle powder is violently agitated by the boiling liquor, until it is driven to the corners of the pan, where, the motion of the liquor being more gentle, it subsides into the scratch-pans placed there to receive it, and in them it remains undisturbed; and thus the greatest part of it is separated from the brine. After the pan has again been filled up with sea-water, three whites of eggs are mixed with the liquor, by which it is clarified a second time, in the manner above described; and it is afterwards boiled down to a strong brine as at first; which second boiling may take up about four hours. The pan is then filled up a third time with clear sea-water; and after that a fourth time; the liquor being each time clarified and boiled down to a strong brine, as before related; and the scratch-pans being taken out and emptied every time that the pan is filled up. Then, at the fourth boiling, as soon as the crystals begin to form on the surface of the brine, they slacken the fire, and only suffer the brine to simmer, or boil very gently. In this heat they constantly endeavour to keep it all the time that the salt corns or granulates, which may be nine or ten hours. The salt is said to granulate, when its minute crystals cohere together into little masses or grains, which sink down in the brine and lie at the bottom of the salt-pan. When most of the liquor is evaporated, and the salt thus lies in the pan almost dry on its surface, it is then time to draw it out. This part of the process is performed by raking the salt to one side of the pan into a long heap; wher it drains a

while from the brine, and is then emptied out into barrows or other proper vessels, and carried into the store-house, and delivered into the custody of his majesty's officers. And in this manner the whole process is performed in twenty-four hours, the salt being usually drawn every morning. In the store-house the salt is put hot into drabs, which are partitions like stalls for horses, lined on three sides and at the bottom with boards, and having a sliding board on the fore-side to put in or draw out as occasion requires. The bottoms are made shelving, being highest at the back side, and gradually inclining forwards; by which means the saline liquor, which remains mixed with the salt, easily drains from it; and the salt in three or four days becomes sufficiently dry, and is then taken out of the drabs and laid up in large heaps, where it is ready for sale. The saline liquor which drains from the salt is not a pure brine of common salt, but has a sharp and bitter taste, and is therefore called *bittern*; this liquor at some works they save for particular uses, at others throw away. A considerable quantity of this *bittern* is left at the bottom of the pan after the process is finished; which, as it contains much salt, they suffer to remain in the pan, when it is filled up with sea-water. But at each process this liquor becomes more sharp and bitter, and also increases in quantity; so that, after the third or fourth process is finished, they are obliged to take it out of the pan, otherwise it mixes in such quantities with the salt as to give it a bitter taste, and disposes it to grow soft and run in the open air, and renders it unfit for domestic uses. After each process there also adheres to the bottom and sides of the pan a white stony crust, of the same calcareous substance with that before collected from the boiling liquor. This the operators call *stone-scratch*, distinguishing the other found in the lead pans by the name of *powder-scratch*. Once in eight or ten days they separate the *stone-scratch* from their pans with iron picks, and in several places find it a quarter of an inch in thickness. If this stony crust is suffered to adhere to the pan much longer, it grows so thick that the pan is burnt by the fire, and quickly wears away.

SALT, NATIVE, or ROCK SALT, or fossil salt, is common salt dug out of the earth. This kind of salt is in several countries found so pure that it serves for most domestic uses, without any previous preparation (trituration excepted); for, of all natural salts, rock-salt is the most abundantly furnished by nature in various parts of the world, being found in large masses, occupying great tracts of land. It is generally formed in strata under the surface of the earth, as in Hungary, Muscovy, Siberia, Poland, Calabria, Egypt, Ethiopia, and the East Indies. 'In England,' says Magellan, 'the salt mines at Northwich are in a high ground, and contain it in layers or strata of various colors, of which the yellow and brown are the most plentiful, as I have observed on the spot, which I visited in June 1782, in company with my worthy and learned friend Mr. Volta, professor of natural philosophy in the university of Pavia, and well known by his great abilities and many discoveries in that branch of

knowledge. The mine into which we descended was excavated in the form of a vast dome or vault under ground, supported by various columns of the salt, that were purposely left to support the incumbent weight. And, the workmen having lighted a number of candles all round its circumference, it furnished us with the most agreeable and surprising sight, whilst we were descending in the large tub which serves to bring up the lumps that are broken from the mine, &c. See the description of the famous salt mines of Wieliczka in Poland, by Mr. Bernard, in the *Journal de Physique*, vol. xvi., for 1780, p. 459, in which the miraculous tales concerning these subterraneous habitations, villages, and towns, are reduced to their proper magnitude and estimate.' But the English fossil salt is unfit for the uses of the kitchen, until by solution and coction it is freed from several impurities, and reduced into white salt. The British white salt is not so proper as several kinds of bay salt for curing fish and such flesh meats as are intended for sea provisions, or for exportation into hot countries. So that for these purposes we are obliged, either wholly or in part, to use bay salt, which we purchase in France, Spain, and other foreign countries.

It is remarked by the writer of the account of the Agriculture of Cheshire, that, from some experiments made on different specimens of the rock-salt of that county, it would appear that the transparent kind of it is an almost pure muriate of soda, which contains no admixture of either earth or earthy salts; and that the color of the less transparent and brown specimens is derived from the earth that enters, in greater or less proportions, into their compositions. That on 480 grains of transparent rock-salt being dissolved in four ounces of distilled water, there was, first, no precipitate let fall, on the addition of carbonate of potash. Secondly, no alteration was produced by this solution on blue vegetable juices. Thirdly, on the addition of a few drops of tincture of galls, a slight purple tinge was given to the solution; and after standing some hours, there was a brown sediment at the bottom of the vessel. Fourthly, on the addition of muriate of barytes, there was no precipitate thrown down. From the first of these trials, it is supposed that rock-salt has no muriate of lime, or muriate of magnesia, combined with it; from the second, that it has no uncombined acid or alkali; from the third, that it contains some portion of iron; and from the fourth, or last, that there is no sulphate of lime contained in it. And that, on examining different specimens of the less transparent, and the brown rock-salt, with the same re-agents as in the above trials, it was found that these consisted of muriate of soda, or sea-salt, in combination with a certain proportion of earth, varying in quantity from one to thirty per cent.; also, that the earth was wholly the argillaceous or common clay; but that some of the specimens contained a few grains of sulphate of lime, in 480 of those of the rock-salt.

The beds of this salt are now well known to be the principal cause of the salt-brine spring; in this county; and, in connexion with some

other circumstances, to have a great share in causing the vast differences in their strength, in different places.

Although rock-salt is found in various parts of the above district, there are no pits of it wrought at present, except in the vicinity of Northwich. Part of the inferior rock-salt which is procured there, is, it is said, used at some of the refineries in that neighbourhood; and a further quantity sent down the river Weaver, for the supply of the refineries at Frodsham, in the same county, and those on the banks of the Mersey, in Lancashire. The purer rock-salt, or that which is called in general Prussian rock, is carried by the same conveyance to the port of Liverpool; whence, according to the above writer, it is exported chiefly to Ireland, and the ports of the Baltic. The annual quantity sent down the first of the above rivers is found, on the average of ten years, to be 51,109 tons. But in this, it is observed, is included what is used at the Frodsham and Lancashire refineries, which may probably be about one-third of the whole. And it is added that it appears, from the report of the committee of the house of commons, appointed to inquire into the laws respecting the salt duties, printed in June, 1801, that,

in 1798	} were exported	{	20,162	} tons of rock-	
1799			33,913		salt.
1800			34,939		

Of this quantity,

in 1798	. . .	16,095	} tons
1799	. . .	22,374	
1800	. . .	19,663	

were sent to different ports in Ireland; the remainder was principally exported to Denmark, Russia, Sweden, Prussia, and Germany. A small quantity went to Guernsey, Jersey, and the West Indies.

In regard to the original formation of the beds or strata of rock-salt, in this and other countries, different theories, opinions, and conjectures, have been formed and proposed; but it is one of those geological questions which are extremely embarrassing in their nature, and very difficult in their solution. Mr. Holland has, however, in the above work, ingeniously stated several suppositions on the subject, and the objections to which they are exposed. It is remarked that, wherever rock-salt is met with, sulphate of lime seems to be very generally discovered in mixture with the earthy strata above it. And the writer of the *Memoir sur le Sel Marin*, in the eleventh volume of the *Annals of Chemistry*, it is added, informs us, that this is the case in Poland, Transylvania, and Hungary; also, that there is commonly a layer of gypsum betwixt the strata of stone and the bed of salt. This gypseous layer is of different colors and is found crystallised, striated, and mixed with marine shells. The gypsum above the beds of rock-salt in Cheshire is, in like manner, found crystallised and striated, but no marine exuviae, or organic remains, it is observed, are ever met with in any of the strata. Nor does gypsum accompany it, as is usual in other places, as near Cordova, in Spain, where rock-salt forms a mountain 500 feet in height, and three miles in circumference, as noticed by

Kirwan and Townshend. Jars, the author of the *Voyages Metallurgiques*, who, it is asserted, has given the most particular account we have of the upper stratum of rock-salt about Northwich, remarks, that 'it appears to have been deposited by layers or beds of several colors;' and that 'these layers of salt are in such a position as to lead us to believe that the deposition of it was made in waves, similar to those which are formed on the sea-coast.' This, Mr. Holland says, coincides with an opinion suggested by Mr. Stanley, a friend of his, in regard to the probable origin of the beds of rock-salt now in existence in this district; who states that rock-salt is there found in several strata, one above the other, with intermediate beds of indurated clay, in the valleys of the Weaver, and those of the other rivers and brooks emptying themselves into it; but that it has never been found so near the surface, as to be above the level of the sea, or beneath any solid rock. If beds of rock-salt are to be considered as so many deposits of salt from sea-water, we must suppose the sea at some former period to have occupied the valleys in this country; and that, from time to time the communications were interrupted between these valleys (then deeper than they are now) and the sea. Earthquakes, or accumulations of sand in the estuaries of the Mersey and the Dee, might, it is contended, have caused the interruptions. Whenever the sea-water in the valleys became separated from the sea, the salt contained in it would subside by the natural process of evaporation. This, it is supposed, would the more easily have taken place, if, by any subterraneous fermentation, the ground below the water should have been heated. To account for a greater accumulation of salt than the sea-water filling all the lowest parts of the district would contain, we must suppose, it is said, that the obstruction interposed between the valleys and the sea had been repeatedly broken down and renewed again. Tides, unusually high, might occasionally overcome the resistance of the accumulated sand; and, if the intervals between the inundations were only of short duration, a subsidence of salt might take place equal to the formation of the thickest stratum of the rock-salt now existing. Long intervals between the inundations would admit of an accumulation of clay, and other earthy particles, over the salt thus deposited; and in this manner would be formed a new basis for another stratum of rock-salt to repose upon. Thus, it is thought, the regular and astonishing existence of salt strata may be accounted for, without necessarily supposing them coeval with the original formation of the earth; but, to confirm the theory, it is suggested that much observation and close enquiry into the natural history of the county would be required.

Mr. Holland, however, suggests that there are many objections to the theory which supposes the beds of rock-salt in this district to have been formed by deposition from the waters of the sea; some of which he states rather for the sake of promoting discussion and enquiry, than of affording any very decided opinion on a matter of so much doubt, uncertainty, and obscurity. Though on making a perpendicular section of the upper bed

of rock-salt, an irregular stratification, such as noticed by Jars, may, he says, by frequent accurate examination, be observed, the general appearance of the sides of the openings, whence the rock-salt is taken, is that of a confused and irregular red mass; in which some portions of salt have a greater, others a less, proportionate admixture of earth; while here and there they may be seen perfectly pure and transparent. He, therefore, asks, is it likely that this irregularity and confusion would have existed, had the beds of rock-salt in this district been formed by the evaporation of sea-water inundating the land at certain intervals of time, as the above theory supposes? On the contrary, says he, would it not be natural to expect from reasonings *a priori*, that the salt, thus deposited from sea-water, would be disposed in layers perfectly regular, and differing from one another merely in thickness, or a few other circumstances of inferior moment? Another fact which, it is supposed, invalidates, in some measure, the notion that the rock-salt has been deposited from the waters of the sea, is the great disproportion of quantity shown by analysis to exist between the earthy salts contained in the brine of this district, and those held in solution by sea-water; the ratio here being as one to ten, or the proportion which the earthy salts bear to the pure muriate of soda in sea-water is ten times greater than that which prevails in the Cheshire brine. The ascertaining of this fact proves, it is supposed, that the rock-salt (from the solution of which the brine is formed) is combined with a much smaller proportion of earthy salts than exists in sea-water; a circumstance difficult to be accounted for, on the supposition that the beds of this substance were formed by the evaporation of the sea-water, occupying the valleys and lowest parts of the land. It must be noticed, however, as worthy of attention, that the earthy salts intermixed with the rock-salt in the above district are the same which are held in solution by sea-water, being principally muriated magnesia and sulphate of lime.

There is, however, a still stronger proof, it is supposed, against the notion that the beds of rock-salt in this county are depositions from the sea-water, in the circumstance that no marine exuviae have ever been discovered in the strata. This, it is imagined, would almost indubitably have been the case, had the land been covered with sea-water during a period of sufficient length for the deposition of beds of salt of such prodigious thickness; and the fact, that no such exuviae do actually exist, is supposed in itself sufficient to induce a suspicion that the theory in question cannot be well founded. Other objections too, it is observed, offer themselves to its validity; such as the enormous depth of sea-water necessary to the production of a body of rock-salt forty yards in thickness; the difficulty, if not impossibility, on such principles, of accounting for the formation of the singular insulated mountain of rock-salt at Cordova in Spain; with others of a more trivial nature, which will readily present themselves in this enquiry. It is, however, at the same time candidly acknowledged, that there are many facts and circumstances of actual observation, that confer a strong degree of

plausibility on the opinion, which it has been here contended against. The certainty that the surface of the county was at some former period much lower than it is at present, and the diminution of the thickness of the strata of rock-salt in proportion as they recede from the sea, are circumstances which undoubtedly range themselves on this side of the question: and, upon the whole, it is thought, that it may be doubted whether the theory, which regards the beds of rock-salt as deposits from sea-water, does not accord more exactly with existing appearances than any other which has been adduced on the subject.

According to the statement of Mr. Holland, in his Agricultural Survey, the first bed and pit of rock-salt was found and wrought in Marbury, at a small distance from the town of Northwich, at the depth of about thirty yards from the surface, in the year 1670, when searching for coal. The bed was thirty yards in thickness, and rested upon a stratum or layer of hard clay. In consequence of this discovery, other similar attempts were made; and, on sinking shafts or pits any where in the vicinity of it within the space of half a mile, it was found to exist at about the same depth from the surface of the earth, when not prevented from being dug down to by brine-springs or those of common water. This continued the only place in which it was found until the year 1779, when this sort of rock was again met with in searching for brine in the neighbourhood of Lawton, at the depth of about forty-two yards, but only of the thickness of about four feet; there being beneath it a bed of indurated clay ten yards in thickness, which, being penetrated through, a second stratum of rock-salt was discovered, twelve feet in thickness; and, on continuing the sinking of the pit, another layer of indurated clay, fifteen yards in thickness, was passed through; below which appeared a third stratum of rock-salt, which was sunk into not less than twenty-four yards; the lowest fourteen yards, being the purest, or the least mixed with other substances, were the only parts that were wrought.

Until this period, in the neighbourhood of Northwich, no attempts had, however, been made to sink pits in order to find a lower stratum of rock-salt; as the one which had been first met with was so thick, and furnished such an abundant supply for every demand, there could be no other inducement to this than the expectation of meeting with a stratum, at a greater depth, which might contain a less admixture of earthy matters. It would seem, too, that the fear of meeting with springs below, which might impede the working out of the materials from the pits, and even render this wholly impracticable, prevented the proprietors of them from sinking deeper. As, however, no inconvenience or interruption of this nature had occurred, on sinking through different alternate strata of rock-salt and clay at Lawton; and it had been found that there was a lower stratum of rock-salt there, which was more pure than those nearer the surface, the owners of one of the works or pits in this vicinity were induced, a little time after the trials at Lawton, as in 1781, to sink deeper than had yet been done, and to

pass through the bed or body of indurated clay lying underneath the rock-salt, which had been so long known and wrought. This indurated clayey material was found to be from ten to eleven yards in thickness; and immediately beneath it a second stratum of rock-salt was met with, the upper part of which differed little in purity from that of the higher stratum or layer of rock; but, on penetrating into it to the extent of from twenty to twenty-five yards, it was there found to be much more pure and free from earthy admixture. But it continued to have this increased degree of purity for four or five yards only; while, for fourteen yards still lower, to which depth the pit or shaft was sunk, the proportion of earthy matter was again as large as in the upper part of the stratum. It was therefore, on this account, thought useless to sink the pit to any greater depth. Many other proprietors of pits, shafts, or mines, in the same neighbourhood, it is stated, followed the example which had been thus set them; and penetrated through the bed of indurated clay lying beneath the upper stratum of rock-salt. A second stratum of rock-salt was constantly met with below this; and, on passing down into it, the same order of disposition as to purity was observed, as in the pit or mine in which it had been first noticed and examined; and the same has been found to prevail in all the pits, shafts, works, and mines, which have since been sunk in the same vicinity. It is further noticed that there is great uniformity in the strata which are passed through in sinking pits for rock-salt or brine; and that they very generally consist of clay and sulphate of lime mixed in various proportions; that of the latter somewhat increasing as the pit, shaft, or work, approaches the rock or brine. The workmen distinguish the clay by the appellation of metal, giving it the name of red, brown, or blue metal, according to its color; and the sulphate of lime by that of plaster.

The strata formed by these are, in general, close and compact; allowing very little fresh water to pass through them. In some places, however, they are broken and porous: and they admit so much fresh water into the pit or work, that, whenever they have been met with, it has been usual to discontinue any attempts to pass through them in sinking the pits. In these places the workmen call the metal saggy. It was thought not only impracticable to overcome a water, which vulgar prejudice had magnified into a great stream running under ground; but it was believed, even if the sinking could be continued below this, that the water could not be kept out of the pit, shaft, or work, and that it would either weaken the brine so as to destroy its value, or would find its way into the cavity of any rock, pit, or mine, which might be found below it. Later experience, it is said, has proved that these ideas were not altogether well founded. A few years ago an attempt was made in Witton to pass through this porous stratum, in order to get to the brine. It was met with about twenty-eight yards from the surface; the thickness of it was about thirteen feet; and the quantity of water, which was forced through it into the pit or shaft, was 360 gallons a minute. By means of

a steam-engine, the sinkers were enabled to pass through this water; to fix a gauge or curb a few yards below it, in a stratum of indurated clay; and thence to bring up a wooden frame, supporting a wall of puddled earth twelve inches thick, by which the access of the fresh water into the pit or shaft was in a great degree prevented, and an opportunity given to pass down to the brine below. A shaft was afterwards sunk through this porous stratum, for the purpose of obtaining rock-salt; which object was, after a short time, defeated, by the influx of brine into the shaft at the surface of the upper stratum of rock-salt; an accident originating in a cause completely distinct from the fresh water in the porous stratum or bed. An exact section of the different strata sunk through in reaching the second bed of rock-salt in the pit at Witton, near Northwich, is given by Mr. Holland in the above report; and all the strata in the neighbourhood of the last town are supposed to have nearly a similar disposition. The inclination of them in the pit or shaft at the above place was from north-west to south-east; and the dip about one yard in nine. The stratum through which the fresh water flowed is shown, and the level it found, it is said, was sixteen yards from the surface, which, it is remarked, nearly corresponds with that of the brook below. The line of separation, between the lowest stratum of earth and the first of rock-salt, is very exactly defined; they are perfectly distinct, and do not at all run into each other. It is farther noticed that, in carrying a horizontal tunnel for 100 yards along the upper stratum of rock-salt, this was found to be irregular and unequal on its surface; the irregularities in a great measure corresponding with those on the surface of the ground above.

Considerable salt-works are carried on in Scotland, and in the northern counties of this country on the sea-coast, by the evaporation of sea-water. At Lymington, in Hampshire, the sea-water is evaporated to one-sixth of the whole by the action of the sun and air.

A Mr. Lowndes some time since published a method of greatly improving the *English brine-salt*, so as to make it at least equal to the French bay-salt. His method is: let a brine-pan, containing about 800 gallons of liquor, be filled with brine to within an inch of the top; then make and light the fire, and, when the brine is just luke-warm, put in either an ounce of blood from the butcher's, or the whites of two eggs. Let the pan boil with all possible violence, and as the scum rises take it off. When the fresh or watery part is pretty well decreased, throw into the pan the third part of a pint of new ale, or the same quantity of the grounds of any malt liquor. When the brine begins to grain, add to it the quantity of a small nut of fresh butter, and, when the liquor has stood half an hour longer, draw out the salt. By this time the fire will be greatly abated, and so will the heat of the liquor; let no more fuel be thrown on the fire, but let the brine gently cool, till a person can just bear to put his hand into it; keep it in that degree of heat as nearly as possible, and when it has worked for some time, and is beginning to grain, throw in the quantity of a small nutmeg of fresh butter,

and about two minutes after that scatter throughout the pan, as equally as may be, an ounce and three quarters of common alum, pulverised very fine; then instantly, with the common iron scrape-pan, stir the brine very briskly in every part of the pan for about a minute; then let the pan settle, and constantly feed the fire, so that the brine may never be quite scalding hot, yet always a great deal more than luke-warm; let the pan stand working thus for about three days and nights, and then draw it, or take out the salt. The brine remaining will, by this time, be so cold that it will not work at all, therefore fresh coals must be thrown upon the fire, and the brine must boil for about half an hour, but not near so violently as before the first drawing; then, with the usual instrument, take out such salt as is beginning to fall, and put it apart; then let the pan settle and cool. When the brine becomes no hotter than one can just put one's hand into it, proceed as before, and let the quantity of alum not exceed an ounce and a quarter, and about eight-and-forty hours after draw the pan, and take out all the salt. Lowndes's Brine Salt improved.

Mr. Lowndes afterwards directs cinders to be chiefly used in preparing the fires, the better to preserve an equal heat, and by that means also he proposes saving a considerable expense, asserting that at present cinders are so little valued in Cheshire as to be thrown out into the highways. Mr. Lowndes adds that, in a pan of the size before-mentioned, there may be prepared, at each process, 1600 lbs. weight of salt from the best brine in Cheshire, and 1066 lbs. from the ordinary brine of that county. This, as the process continues five days, is a little more than five bushels and a half of salt a day from the best brine, and a little more than four bushels a day from the ordinary kind.

The commerce of salt has formerly brought an immense profit to France, or rather to the royal treasury than to the makers and sellers, on account of the heavy duty. The English and Dutch, and (when they are at war with France) the Swedes and Danes, have taken off most of the salt of the Comté Nantois; paying for it, communibus annis, from twenty to thirty-five livres the load. That of Guerande has been preferred, by the English and Irish, to all the rest, as the best. Yet that of Borneuf, though browner and heavier, is most used in France, as also throughout the Baltic; particularly in Poland, where, besides the ordinary uses, it serves in tilling the ground; being found to warm it, and prevent little vermin from gnawing the grain. The English and Dutch have often striven hard, in times of war, to do without the French salt; and to that end have endeavoured to take salt from the Spaniards and Portuguese; but there is a disagreeable sharpness and serosity natural to this salt, which renders it very unfit for the salting of flesh, fish, &c. To remove this they boil it with sea-water, and a little French salt, which they procure by means of neutral nations, which not only softens it, but increases its quantity by one-third. But it should seem their refining does not succeed to their wish, by the eagerness with which they return to the salt of Bretagne, &c.

The duties on salt in this country are now wholly insignificant.

SALT, in chemistry. This term has been usually employed to denote a compound, in definite proportions, of any acid, with an alkali, earth, or metallic oxide. When the proportions of the constituents are so adjusted that the resulting substance does not affect the color of infusion of litmus, or red cabbage, it is then called a neutral salt. When the predominance of acid is evinced by the reddening of these infusions the salt is said to be acidulous, and the prefix *super*, or *bi*, is used to indicate this excess of acid. If, on the contrary, the acid appears to be less than is necessary for neutralising the alkalinity of the base, the salt is then said to be with excess of base, and the prefix *sub* is attached to its name. See **CHEMISTRY**, and the various acids and metals in the alphabetical arrangement.

SALT, ARSENICAL, NEUTRAL OF MACQUER. Superarseniate of potash.

SALT, BITTER, CATHARTIC. Sulphate of magnesia.

SALT, COMMON. Muriate of soda.

SALT, DIGESTIVE, OF SYLVIVS. Acetate of potash.

SALT, DIURETIC. Acetate of potash.

SALT, EPSOM. Sulphate of magnesia.

SALT, FEBRIFUGE, OF SYLVIVS. Muriate of potash.

SALT, FUSIBLE. Phosphate of ammonia.

SALT, FUSIBLE, OF URINE. Triple phosphate of soda and ammonia.

SALT, GLAUBER'S. Sulphate of soda.

SALT, MARINE. Muriate of soda.

SALT, MARINE, ARGILLACEOUS. Muriate of alumina.

SALT, MICROCOSMIC. Triple phosphate of soda and ammonia.

SALT, NITROUS, AMMONIACAL. Nitrate of ammonia.

SALT OF AMBER. Succinic acid.

SALT OF BENZOIN. Benzoic acid.

SALT OF CANAL. Sulphate of magnesia.

SALT OF COLCOTHAR. Sulphate of iron.

SALT OF EGRA. Sulphate of magnesia.

SALT OF LEMONS, ESSENTIAL. Superoxalate of potash.

SALT OF SATURN. Acetate of lead.

SALT OF SEDLITZ. Sulphate of magnesia.

SALT OF SEIGNETTE. Triple tartrate of potash and soda.

SALT OF SODA. Subcarbonate of soda.

SALT OF SORREL. Superoxalate of potash.

SALT OF TARTAR. Subcarbonate of potash.

SALT OF VITRIOL. Purified sulphate of zinc.

SALT, PERLATE. Phosphate of soda.

SALT, POLYCHREST, OF GLASER. Sulphate of potash.

SALT, SEDATIVE. Boracic acid.

SALT, SPIRIT OF. Muriatic acid was formerly called by this name, which it still retains in commerce.

SALT, SULPHUREOUS, OF STAHL. Sulphate of potash.

SALT, WONDERFUL PERLATE. Phosphate of soda.

SALT MINES. The salt mines of Wieliczka, near Cracow. Poland, are very extraordinary

caverns. Wraxall describes them thus, in his *Memoirs of the Courts of Berlin, Dresden, Warsaw, Vienna*:—‘After being let down,’ says he, ‘by a rope to the depth of 230 feet, our conductors led us through galleries which, for loftiness and breadth, seemed rather to resemble the avenues to some subterranean palace than passages cut in a mine. They were perfectly dry in every part, and terminated in two chapels, composed entirely of salt, hewn out of the solid mass. The images which adorn the altars, as well as the pillars and ornaments, were all of the same transparent materials; the points and spars of which, reflecting the rays of light from the lamps which the guides held in their hands, produced an effect equally novel and beautiful. Descending lower into the earth, by means of ladders, I found myself in an immense hall or cavern of salt, many hundred feet in height, length, and dimensions, the floor and sides of which were cut with exact regularity; 1000 persons might dine in it without inconvenience, and the eye in vain attempted to trace or define its limits. Nothing could be more sublime than this vast subterranean apartment, illuminated by flambeaux, which faintly discover its prodigious magnitude, and leave the imagination at liberty to enlarge it indefinitely. After remaining about two hours and a half under ground, I was drawn up again in three minutes with the greatest facility.’

SALTA, or **SAN MIGUEL DE SALTA**, a city and district of Tucuman, South America, was founded in 1582, under the name of San Clemente de la Nueva Sevilla, but was afterwards changed to its present site in the beautiful valley of Lerma. Its environs are very fertile, abounding in wheat, rye, and vines, with pastures for the cattle exported from this place to Peru; and its commerce consists in corn, meal, wine, cattle, salt meat, fat, hides, and other commodities, which are sent to all parts of Peru. It is computed that the number of mules fattened in the valley of Lerma amount, during the months of February and March, when the annual fair is held, to 60,000; and, besides these, there are generally 4000 horses and cows. The natives are subject to a species of leprosy, and nearly all the women, after they have attained the age of twenty, have the goitrous swelling in the throat, which disfigures them very much. It is fifty miles south of Jujui; and the river which washes the town turns east, and enters the Vermeijo.

SALTASH, a borough and market town of Cornwall, seated on the side of a steep hill, on the banks of the Tamar; it has three streets, which, from the declivity, are washed clean by every shower of rain that falls. It possesses many privileges, and has jurisdiction on the Tamar, to the mouth of the port, claiming anchorage dues of all vessels that enter the harbour; and their coroner sits upon all bodies found drowned in the river. It has sent two members to parliament ever since the reign of Edward VI., who are elected by the mayor, recorder, six aldermen, and twenty freeholders. It has a market on Saturday, and sufficient depth of water in its harbour for large vessels. It lies six miles north-west of Plymouth, and 220 W.S.W. of London.

SALTA'TION, *n. s.* Lat. *saltatio*. The act of dancing; jumping: beat; palpitation.

The locusts being ordained for *saltation*, their hinder legs do far exceed the others.

Broune's Vulgar Errors.

If the great artery be hurt, you will discover it by its *saltation* and florid colour.

Wiseman's Surgery.

SALTCOATS, a sea-port town of Ayrshire, five miles north-west of Irvine. It has an excellent harbour, capable of admitting vessels of 220 tons. In 1700 it became the property of Sir Robert Cunningham, who began to work the valuable strata of coals in the neighbourhood, and built a harbour at Saltcoats to export them. He also erected several large pans for the manufacture of salt; which proved so successful that there is now made above 3000 bolls annually. Ship-building was also commenced and carried on with success. Notwithstanding the population and prosperity of this town it has neither magistrates, nor police, nor even a weekly market, but only one annual fair. A bailiff levies the dues of anchorage, and executes such regulations as are necessary for loading the vessels, sailing, &c., and the masters or owners of these vessels enter into a written obligation to observe these regulations. Saltcoats lies ten miles north-west of Ayr, and twenty-two south-west of Glasgow.

SALTER (John), an English officer, born in 1709, who by his merit rose from the ranks to be a major-general, and lieutenant-colonel, of the first regiment of foot. The duke of Cumberland, then in the guards, first noticed him, made him serjeant in his own company, and some time after gave him a commission, and patronised him publicly in presence of all the other officers. He died in 1787, aged seventy-eight.

SALTER (Samuel), D.D., a learned English divine, born at Norwich, and educated at the Charter House. He was admitted of Benet College, Cambridge, in 1730, where he obtained the degree of B.A. and a fellowship. He became soon after preceptor to the sons of Sir Philip Yorke, chief justice of the king's bench, who also made him his chaplain, a prebendary of Gloucester, and rector of Burton Coggles, in 1740, where he married Miss Secker, a relation of the bishop of Oxford. In 1750 he was made minister of Great Yarmouth; in 1751 archbishop Herring created him D.D.; in 1756 the lord chancellor made him rector of St. Bartholomew; and, in 1761, master of the Charter House. He published *Pindaric Odes*, in Greek, on the nuptials of the Princes of Wales and Orange; *Latin Verses on the Death of Queen Caroline*; and *Sermons, Tracts, &c.* He died May 2, 1778.

SALTFLEET, a sea-port town of Lincolnshire, with a market on Saturday; seven miles south of the mouth of the Humber, thirty-three north-east of Lincoln, and 158 north of London.

SALTIER, *n. s.* Fr. *sautiere*. A term of heraldry,

A *saltier* is in the form of a St. Andrew's cross, and by some is taken to be an engine to take with beasts; in French it is called un sautoir: it is an honourable bearing.

Peacham.

SALTIER. See **HERALDRY**. This, says G.

Lergh, in his *Accidence of Arms*, was anciently made of the height of a man, and driven full of pins, the use of which was to scale walls, &c. Upton derives this word from *saltus*, i. e. a forest. The French call this ordinary sautoir, from *sauter*, to leap; perhaps because it may have been used by soldiers to leap over walls of towns, which in former times were low; but some think it is borne in imitation of St. Andrew's cross.

SALTINBANCO, *n. s.* Lat. *saltare in banco*, to climb as a mountebank mounts a bank or bench. A quack or mountebank.

Saltinbancoes, quacksalvers, and charlatans, deceive them: were Esop alive, the Piazza and Pont-neuf could not speak their fallacies.

Browne's Vulgar Errors.

He played the *saltinbanco's* part,
Transformed to a Frenchman by my art. *Hudibras.*

SALTPETRE. See GUNPOWDER and NITRIC ACID.

SALVABLE, *adj.* Lat. *salvo*. Possible
SALVABILITY, *n. s.* } to be saved; the noun
SALVAGE, } substantive correspond-
SALVATION, } ing: salvage is a legal
SALVATORY. } claim for assisting a
wrecked vessel: salvation, preservation from
eternal death: the act of saving.

As life and death, mercy and wrath, are matters of understanding or knowledge, all men's *salvation*, and all men's endless perdition, are things so opposite, that whosoever doth affirm the one must necessarily deny the other. *Hooker.*

Why do we Christians so fiercely argue against the *salvability* of each other, as if it were our wish that all should be damned, but those of our particular sect? *Decay of Piety.*

Our wild fancies about God's decrees have in event reprobated more than those decrees, and have bid fair to the damning of many whom those left *salvable*. *Id.*

Him the most High,
Wrapped in a balmy cloud with winged steeds,
Did, as thou saw'st, receive; to walk with God
High in *salvation*, and the climes of bliss,
Exempt from death. *Milton's Paradise Lost.*

I consider the admirable powers of sensation, phantasy, and memory, in what *salvatories* or repositories the species of things past are preserved.

Hale's Origin of Mankind.

SALVADOR (ST), the city of San Salvador, the chief place of the province, and the second of Brasil, is built on a rocky eminence 600 feet high, on the east shore of All Saints' bay, a league within Cape Salvador, the east point of the entrance. The streets, though wide, are so steep as generally to preclude the use of carriages. The number of private houses is about 2000, mostly of stone, and massively built. The religious buildings are of course numerous and rich, particularly the cathedral, dedicated to San Salvador. The population has been estimated at 30,000 whites, and 70,000 Indians and negroes. The natural strength of the position is aided by strong fortifications, and the garrison usually consists of 5000 regular troops, besides a large white and black militia. Many ships of war and merchant vessels are built here. The buildings are chiefly of the seventeenth century, ill constructed, and, from the slightness of the materials, rapidly decaying, which diminishes the effect of many of them once sumptuous. The town is

divided into high and low, the latter consisting of streets filled with store houses on the shores of the bay, for the convenience of loading and unloading.

SALVADOR (ST), the name given by the Portuguese missionaries to the capital of the kingdom of Congo, in Western Africa. We have no account of it, except theirs, which is somewhat antiquated. They describe it as built at the top of a rocky and steep hill, in a plain about ten miles in circumference. The king's palace consists of a vast enclosure, about a league in circuit. The Portuguese had a quarter assigned to them, they tell us, which they built partly of stone and enclosed. They had erected a church, and invested one of their number with the title of bishop. The late British expedition, though they found no Portuguese on any part of the Zaire, were yet informed that a few still remained in this capital.

SALVADOR (ST), a district of Guatemala, in South America, which produces in great abundance sugar-cane and indigo.

SALVADOR (ST), the capital of the above province, situated on the banks of a river, at the distance of twelve miles from the Pacific. It has a little trade, and is the residence of a governor. Population about 5000 Indians, whites, and castes. 140 miles E. S. E. of Guatemala.

SALVADOR (ST), one of the Bahama Islands, discovered by Columbus in 1492. It is also known by the name of Cat Island, and, except at the south extremity, is very narrow. The population in 1797 amounted, including whites, to 657, and in 1803, the era of patented estates granted by the crown for cultivation, to 28,903.

SALVADORA, in botany, a genus of the monogynia order, and tetrandria class of plants: CAL. quadrifid: COR. none: BERRY monospermous; species one only, a Persian shrub; the seed covered with an antlus or loose coat.

SALVAGE, *adj.* Fr. *sauleve*; Ital. *selvaggio*, from Lat. *silva*. Wild; rude; cruel. Now spoken and written **Savage**, which see

May the Essexian plains

Prove as a desert, and none there make stay
But *savage* beasts, or men as wild as they. *Walter.*

A *savage* race inured to blood. *Dryden.*

SALVAGE MONEY, a reward allowed by the civil and statute law for the saving of ships or goods from the danger of the sea, pirates or enemies.—Where any ship is in danger of being stranded or driven on shore, justices of peace are to command the constables to assemble as many persons as are necessary to preserve it; and, on its being preserved by their means, the persons assisting therein shall, in thirty days after, be paid a reasonable reward for their salvage; or otherwise the ship or goods shall remain in the custody of the officers of the customs, as a security for the same. And in case the said officer of the customs, and the owners, &c., of the ship shall be unable to agree concerning the sum to be paid as salvage, they shall have power to nominate three neighbouring justices, who shall adjust the quantum of the gratuity to be paid to the several persons acting in the salvage of the ship or goods; and such adjustment shall be binding on all parties, and shall be re-

coverable in an action at law to be brought by the respective persons to whom the same shall be allotted by the justices. And, in case no person shall appear to make his claim to all or any of the goods saved, then the chief officer of the customs of the nearest port shall apply to three of the nearest justices, who shall put him or some responsible person in possession of such goods, such justices taking an account thereof in writing, to be signed by such officers of the customs; and if the goods shall not be legally claimed within twelve months, by the right owners, they shall be publicly sold, or, if perishable, forthwith sold, and the produce of the sale, after all charges deducted, with a fair account of the whole, shall be transmitted to the exchequer, there to remain for the benefit of the owner, when appearing; who, upon affidavit, or other proof of his right, to the satisfaction of one of the barons of the coif, shall, upon his order, receive the same out of the exchequer.

SALVAGES, a group of uninhabited islands, or rather rocks, off the coast of Africa, immediately north of the Canaries.

SALUBRIOUS, *adj.* } Latin *salubris*.

SALUBRITY, *n. s.* } } Wholesome; healthful; promoting health; wholesomeness.

The warm limbeck draws
Subluous waters from the nocent brood. *Philips.*

SALVE, *n. s. & v. a.* } Originally and properly *salv*, which having salves in the

plural, the singular in time was borrowed from it. Sax. *realf*; Lat. *salvus*, *salvo*. A glutinous matter applied to wounds and hurts; a plaster; help; remedy: to cure by medicaments; help by a salvo; salute (obsolete): a salver is a dish to save what is left: salvo, an exception, reservation, or excuse.

Some seek to *salve* their blotted name
With others blot, 'till all do taste of shame. *Sidney.*

Our mother tongue, which truly of itself is both full enough for prose, and stately enough for verse, hath long time been counted most bare and barren of both; which default, when as some endeavoured to *salve* and cure, they patched up the holes with rags from other languages. *Spenser.*

That stranger knight in presence came,
And goodly *salved* them; who mought again
Him answered as courtesy became. *Faerie Queene.*

Many skilful leeches him abide,
To *salve* his hurts. *Id.*

Ignorant I am not how this is *salved*: they do it but after the truth is made manifest. *Hooker.*

Let us hence, my sovereign to provide
A *salve* for any sore that may betide.
Shakspeare. Henry VI.

My more particular,
And that which most with you should *salve* my going,
Is Fulvia's death. *Id. Antony and Cleopatra.*

The schoolmen were like the astronomers, who, to *salve* phenomena, framed to their conceit eccentricks and epicycles; so they, to *salve* the practice of the church, had devised a great number of strange positions. *Bacon.*

Sleep is pain's easiest *salve*, and doth fulfil
All offices of death except to kill. *Donne.*

They admit many *salvos*, cautions, and reservations, so as they cross not the chief design. *King Charles.*

Go study *salves* and treacle: ply
Your tenant's leg, or his sore eye. *Cleaveland.*

If they shall excommunicate me, hath the doctrine of meekness any *salve* for me then?

Hammond.
The royal sword thus drawn has cured a wound,
For which no other *salve* could have been found.

Waller.
Though most were sorely wounded, none were slain;

The surgeons soon despoiled them of their arms,
And some with *salves* they cure. *Dryden.*

It will be hard if he cannot bring himself off at last with some *salvo* or distinction, and be his own confessor. *L'Estrange.*

He has printed them in such a portable volume that many of them may be ranged together on a single plate; and is of opinion that a *salver* of spectators would be as acceptable an entertainment for the ladies, as a *salver* of sweetmeats.

Addison.
If others of a more serious turn join with us deliberately in their religious professions of loyalty, with any private *salvos* or evasions, they would do well to consider those maxims in which all casuists are agreed. *Id.*

There must be another state to make up the inequalities of this, and *salve* all irregular appearances. *Atterbury.*

Between each act the trembling *salver* ring,
From soup to sweet wine. *Pope.*

This conduct might give Horace the hint to say, that, when Homer was at a loss to bring any difficult matter to an issue, he laid his hero asleep, and this *salved* all difficulty. *Broome.*

SALVE REGINA, among the Romanists, the name of a Latin prayer, addressed to the Virgin. It was composed by Peter, bishop of Compostella. The custom of singing it at the close of the office was begun by order of St. Dominic, in the congregation of Dominicans at Bologna, about 1237. Gregory IX. first appointed it to be general. St. Bernard added the conclusion, *O dulcis! O pia, &c.*

SALVI (John), an eminent Italian historical painter, born near Urbino in 1504. He excelled chiefly in copying the works of the great masters, which he did with surprising accuracy. He died in 1590.

SALVIA, sage, a genus of the monogynia order, and digynia class of plants; natural order forty-second, verticillatæ: cor. unequal; filaments placed crosswise on a pedicel. The most remarkable species are these:—

1. *S. auriculata*, common sage of virtue, is well known in the gardens and markets. The leaves are narrower than those of the common sort; they are hoary, and some of them are indented on their edges towards the base, which indentures have the appearance of ears. The spikes of flowers are longer than those of either the second or fourth species, and the whorls are generally naked, having no leaves between them. The flowers are smaller, and of a deeper blue than those of common red sage.

2. *S. officinalis*, the common large sage, which is cultivated in gardens, of which there are the following varieties:—1. The common green sage. 2. The wormwood sage. 3. The green sage with a variegated leaf. 4. The red sage. 5. The red sage with a variegated leaf. These are accidental

variations, and therefore are not enumerated as species. The common sage grows naturally in the southern parts of Europe, but it is here cultivated in gardens for use; that variety with red or blackish leaves is the most common in the British gardens; and the wormwood sage is in greater plenty here than the common green-leaved sage, which is not common in gardens.

3. *S. pomifera*, with spear-shaped oval entire leaves, grows naturally in Crete. It has a shrubby stalk, which rises four or five feet high, dividing into several branches. The flowers grow in spikes at the end of the branches; they are of a pale blue color, and have obtuse empalements. The branches have often punctures made in them by insects, at which places grow large protuberances as big as apples, in the same manner as the galls upon an oak, and the rough balls on the briar.

4. *S. tomentosa*, generally called balsamic sage by the gardener. The stalks do not grow so upright as those of the common sage; they are very hairy, and divide into several branches, garnished with broad heart-shaped woolly leaves standing upon long foot-stalks; they are sawed on their edges, and their upper surfaces are rough; the leaves which are upon the flower-stalks are oblong and oval, standing upon shorter foot-stalks, and are very slightly dentated on their edges; they grow in whorled spikes toward the top of the branches; the whorls are pretty far distant, but few flowers in each; they are of a pale blue, about the size of those of the common sort. This sage is preferred to all the others for making sage tea. All the sorts of sage may be propagated by seeds, if they can be procured; but as some of them do not perfect their seeds in this country, and most of the sorts, especially the common kinds for use, are easily propagated by slips, it is not worth while to raise them from seeds.

SALVIANS, or **SALVIANUS**, an ancient father of the Christian church, who flourished about A. D. 440, and was well skilled in the sciences. Some say he was a Gaul; others a German. He resided long at Trier, and was called the Jeremiah of the fifth century. He acquired such reputation for his piety and learning that he was named the master of the bishops. He wrote *A Treatise on Providence*; another on the Avarice of the Clergy; and nine epistles, of which Barluze has given an excellent edition; that of Conrad Rittershusius, in 2 vols. 8vo., is also esteemed.

SALVIATI (Francis), an eminent painter, born in Florence, 1510. His manner of designing approached very near that of Raphael; and he worked in distemper, fresco, and oil. His naked figures are peculiarly graceful, as well as those in drapery. He died in 1563.

SALVIATI (Joseph), an eminent painter and mathematician, born in Venice in 1535. His original name was Porta. He was often employed in conjunction with Paul Veronese and Tintoret. His skill was equally great in designing and coloring; and he wrote several useful Treatises on Mathematics. He died in 1585. Both these painters took the name of Salviati from a cardinal, who patronised them greatly.

SALVINI (Antonio Marie), a learned Italian,

who became professor of Greek at Florence. He translated Homer's *Iliad* and *Odyssey*; with the poems of Hesiod, Theocritus, Anacreon, and many of the minor Greek poets, into Italian verse. He was a member of the academy de la Crusca, and assisted in the compilation of their Dictionary, in 6 vols. He died in Florence in 1729.

SALUS, in the Roman mythology, the goddess of health, and the daughter of *Æsculapius*, called *Hygieia* by the Greeks. We find her name on many medals of the Roman emperors, with different inscriptions; as, *SALUS PUBLICA*, *SALUS REIPUBLICÆ*, *SALUS AUGUSTI*, &c.

SALUSTE (William de), Du Bartas, a French poet, who lived in the sixteenth century. He was employed by Henry IV. of France in England, Denmark, and Scotland; and commanded a troop of horse in Gascony, under marshal de Martignan. He was a Calvinist, and died in 1590, aged forty-six. He wrote a great number of poems; the most famous are, 1. *The Week*, or the Creation of the World, in seven books. 2. *The Poem of Judith*: and, 3. *The Battle of Ivry*, gained by Henry IV. in 1590. He wrote in a bombastic style.

SALUTARY, *adj.* } Fr. *salutaire*; Lat.

SALUTARINESS, *n. s.* } *salutaris*. Wholesome; healthful; safe; contributing to health or safety: the noun substantive corresponding.

The gardens, yards, and avenues are dry and clean; and so more *salutary* as more elegant. *Ray.*

It was want of faith in our Saviour's countrymen, which hindered him from shedding among them the *salutary* emanations of his divine virtue; and he did not many mighty works there, because of their unbelief. *Bentley.*

SALUTATION, *n. s.* } Fr. *salutation*;

SALUTE, *v. a. & n. s.* } Lat. *salutatio*. The

SALUTER. } act or style of saluting; greeting: to greet; kiss: a kiss: one who salutes.

The early village cock

Hath twice done *salutation* to the morn.

Shakspeare.

One hour hence

Shall *salute* your grace of York as mother. *Id.*

Would I had no being,

If this *salute* my blood a jot: it fairs me,
To think what follows. *Id. Henry VIII.*

In all public meetings, or private addresses, use those forms of *salutation*, reverence, and decency, used amongst the most sober persons.

Taylor's Rule of Holy Living.

On her the angel hail

Bestowed, the holy *salutation* used

To bless Mary.

Milton.

O, what avails me now that honour high

To have conceived of God, or that *salute*,

Hail highly favoured, among women blest! *Id.*

The custom of praying for those that sneeze is more ancient than these opinions hereof; so that not any one disease has been the occasion of this *salute* and deprecation. *Broune.*

There cold *salutes*, but here a lover's kiss.

Roscommon.

Court and state he wisely shuns;

Nor bribed to servile *salutations* runs.

Dryden.

Continual *salutes* and addresses entertaining him all the way, kept him from saving so great a life, but

with one glance of his eye upon the paper, till he came to the fatal place where he was stabbed.

South.

I shall not trouble my reader with the first *salutes* of our three friends.

Addison.

SALUTATION, VARIOUS MODES OF. Modes of salutation have, in different countries, very different characters, and it is not uninteresting to examine their shades. Many display a refinement of delicacy; others are remarkable for their simplicity, or sensibility. The islanders, near the Philippines, take the hand or foot of him they salute, and with it they gently rub their face. The Laplanders apply their nose strongly against that of the persons they salute. Dampier says that, at New Guinea, they are satisfied in placing on their heads the leaves of trees, which have ever passed for symbols of friendship and peace. Other salutations are very inconvenient; it requires great practice to enable a man to be polite in an island in the Straits of the Sound. Houtman tells us, 'They raised his left foot, which they passed gently over the right leg, and thence over his face.' The inhabitants of the Philippines bend their body very low, in placing their hands on their cheeks, and raising at the same time one foot in the air, with their knee bent. An Ethiopian takes the robe of another, and ties it about his own waist, so that he leaves his friend half naked. Sometimes men place themselves naked before the person whom they salute, to show their humility, and that they are unworthy of a covering in his presence. This was practised before Sir Joseph Banks, when he received the visit of two Otaheitan ladies. Sometimes they only undress partially. The Japanese only take off a slipper; the people of Arracan their sandals in the street, and their stockings in the house. The grandees of Spain claim the right of appearing covered before the king to show that they are not so much subjected to him as the rest of the nation. When two negro monarchs visit they embrace in snapping three times the middle finger. When the inhabitants of Carthage, says Athenæus, would show a peculiar mark of esteem, they opened a vein, and presented for the beverage of their friend, the blood as it issued. The Franks tore hair from their head, and presented it to the person whom they saluted. The slave cut his hair, and offered it to his master. The Chinese are singularly particular in their personal civilities; they even calculate the number of their reverences. The men move their hands in an affectionate manner, while they are joined together on their breast, and bow their head a little. If two persons meet after a long separation, they both fall on their knees and bend their faces to the earth, and this they repeat two or three times. If a Chinese is asked how he finds himself in health? he answers, Very well: thanks to your abundant felicity. If they would tell a man that he looks well, they say, Prosperity is painted on your face; or, Your air announces your happiness. All these and many other answers are prescribed by the Chinese academy of compliments. There are determined the number of bows, the expressions to be employed, the genuflections, and the inclinations to be made to the right or left hand,

the salutations of the master before the chair where the stranger is to be seated; for he salutes it most profoundly, and wipes the dust away with the skirts of his robe. The lower class of people are equally nice in these punctilios; and ambassadors pass forty days in practising them before they can appear at court. The marks of honor are frequently arbitrary; to be seated, with us, is a mark of repose and familiarity; to stand up, that of respect. There are countries, however, in which princes will only be addressed by persons who are seated, and it is considered as a favor to be permitted to stand in their presence. This custom prevails in despotic countries: a despot cannot suffer without disgust the elevated figure of his subjects; he is pleased to bend their bodies with their genius: his presence must lay those who behold him prostrate on the earth: he desires no eagerness, no attention; he would only inspire terror.

SALUTE, in military matters, a discharge of artillery or small arms, or both, in honor of some person of extraordinary quality. The colors likewise salute royal persons, and generals commanding in chief; which is done by lowering the point to the ground. In the field, when a regiment is to be reviewed by the king or his general, the drums beat a march as he passes along the line, and the officers salute one after another, bowing their half-pikes or swords to the ground; then recover and take off their hats. The ensigns salute all together by lowering their colors. In the navy this ceremony is variously performed, according to the circumstances, rank, or situation of the parties. It consists in firing a certain number of cannon, or volleys of small arms; in striking the colors or topsails; or in one or more general shouts of the whole ship's crew, mounted on masts or rigging for that purpose. The principal regulations with regard to salutes in the royal navy are as follows:—When a flag-officer salutes the admiral and commander in chief of the fleet he is to give him fifteen guns; but when captains salute him they are to give him seventeen guns. The admiral and commander-in-chief of the fleet is to return two guns less to flag-officers, and four less to captains. Flag-officers saluting their superior or senior officer are to give him thirteen guns. Flag-officers are to return an equal number of guns to flag-officers bearing their flags on the same mast, and two guns less to the rest, as also to the captains. When a captain salutes an admiral of the white or blue he is to give him fifteen guns; but to vice or rear-admirals thirteen guns. When a flag-officer is saluted by two or more of his majesty's ships he is not to return the salute till all have finished, and then to do it with such a reasonable number of guns as he shall judge proper. In case of the meeting of two squadrons, the two chiefs only are to exchange salutes. And, if single ships meet a squadron consisting of more than one flag, the principal flag only is to be saluted. No salutes shall be repeated by the same ships unless there has been a separation of six months at least. None of his majesty's ships of war, commanded only by captains, shall give or receive salutes from one another, in whatsoever part of the world they meet. A flag-officer com-

standing in chief shall be saluted, upon his first hoisting his flag, by all the ships present, with such a number of guns as is allowed by the first, third, or fifth articles. When any of his majesty's ships meet with any ship or ships belonging to any foreign prince or state, within his majesty's seas (which extend to Cape Finisterre), it is expected that the said foreign ships do strike their topsail, and take in their flag, in acknowledgment of his majesty's sovereignty in those seas: and if any shall refuse, or offer to resist, it is enjoined to all flag-officers and commanders to use their utmost endeavours to compel them thereto, and not suffer any dishonor to be done to his majesty. And if any of his majesty's subjects shall so much forget their duty as to omit striking their topsail in passing by his majesty's ships, the name of the ship and master, and whence and whither bound, together with affidavits of the fact, are to be sent up to the secretary of the admiralty, in order to their being proceeded against in the admiralty court. And it is to be observed that, in his majesty's seas, his majesty's ships are in nowise to strike to any; and that in other parts no ship of his majesty is to strike her flag or topsail to any foreigner, unless such foreign ship shall have first struck, or at the same time struck, her flag or topsail to his majesty's ship. The flag-officers and commanders of his majesty's ships are to be careful to maintain his majesty's honor upon all occasions, giving protection to his subjects, and endeavouring, what in them lies, to secure and encourage them in their lawful commerce; and they are not to injure, in any manner, the subjects of his majesty's friends and allies. If a foreign admiral meets with any of his majesty's ships, and salutes them, he shall receive gun for gun. If he be a vice-admiral, the admiral shall answer with two guns less; if a rear-admiral, the admiral and vice-admiral shall return two less. But if the ship be commanded by a captain only, the flag-officer shall give two guns less, and captains an equal number. When any of his majesty's ships come to an anchor in any foreign port or road, within cannon-shot of its forts, the captain may salute the place with such a number of guns as has been customary, upon good assurance of having the like number returned, but not otherwise. But if the ship bear a flag, the flag-officer shall first carefully inform himself how flags of the like rank, belonging to other crowned heads, have given or returned salutes, and to insist upon the same terms of respect. It is allowed to the commanders of his majesty's ships in foreign parts to salute the persons of any admirals, commanders-in-chief, or captains of ships of war of foreign nations, and foreign noblemen, or strangers of rank, coming on board to visit the ship; and the number of guns is left to the commander, as he shall be suitable to the occasion and quality of the person visiting; but he is nevertheless to remain accountable for any excesses in the abuse of this liberty. If the ship visited be in company with other ships of war, the captain is not to make use of the civilities allowed in the preceding articles but with leave and consent of the commander-in-chief or the senior captain. Merchant ships, whether foreign-

ers or belonging to his majesty's subjects, saluting the admiral of the fleet, shall be answered by six guns less; when they salute any other flag-ships, they shall be answered by four guns less; and, if they salute men of war commanded by captains, they shall be answered by two guns less. If several merchant ships salute in company, no return is to be made till all have finished, and then by such a number of guns as shall be thought proper; but, though the merchant-ships should answer, there shall be no second return. None of his majesty's ships of war shall salute any of his majesty's forts or castles in Great Britain or Ireland on any pretence whatsoever.

SALUZZO, a district of Piedmont, forming part of the continental states of the king of Sardinia, and bounded by the county of Nice, the valley of Lucerne, and the frontier of France, extending along the province of Dauphiny. It has a superficial extent of 750 square miles, mountainous and rugged; but, from warmth of climate, its soil is in many parts fertile, producing corn, hemp, fruit, wine, and silk. It is commonly called the marquise of Saluzzo. Population 126,000.

SALUZZO, a town of the Sardinian states, in the north-west of Italy, the capital of the above district, situated at the foot of the Alps, not far from the source of the Po. Including its suburbs, it has above 10,000 inhabitants. It is tolerably well built, and contains a cathedral and several churches worth notice. The silk manufactures are extensive. It is the see of a bishop, and stands on an eminence. Twenty-eight miles south of Turin.

SALZBURG, a province and city in the west of Austria, lying between Styria, Tyrol, and Bavaria. Its area, since the cession of Berchtesgaden to Bavaria, is about 2800 square miles, and its population 142,000. It consists partly of a great valley, with the Salza flowing along the middle, and partly of a track of mountains and defiles. The ground is highest in the south, where it forms part of the Noric Alps. The climate of this mountainous region is much more severe than might be expected in 46° 55' and 47° 58' N. lat. Even in the neighbourhood of Salzburg, the hills, which are here much inferior to those of the south, are covered with snow before October. In the south the winter lasts, with little intermission, from the beginning of November to April, and showers and frosts follow till about the end of June. The Sirocco, so well known in the Mediterranean, then passes along these valleys from Italy, and, though much cooled in this mountain track, has not even here lost its power, though it seldom lasts above a day.

SAMANAP, a large town on the south-east coast of the island of Madura. It is situated on a fine bay, which, though rather shallow, will admit of large brigs or prows, lying close up to the town. This place carries on an extensive commerce; and the country abounds in rice, and teak timber. Here the Dutch used to build their largest ships for the country trade.

SAMANEANS, an ancient philosophical sect of India, mentioned by Greek writers, who devoted themselves entirely to the study of divine wisdom, and gave up all private property, com-

mitting the care of their families to the State. Their Society was supported at the public expense. They were a kind of magi, and have been confounded by some with the Brahmins. They proceeded from Ariana, a province of Persia, and the neighbouring countries, spread themselves in India, and taught new doctrines. The Brahmins, before their arrival, were in the highest period of their glory, were the only oracles of India, and their principal residence was on the banks of the Ganges, and in the adjacent mountains; while the Samaneans were settled towards the Indus. Others say that the Brahmins acquired all their knowledge from the Samaneans. The most celebrated and ancient of the Samanean doctors was Boutta, or Buddah, who was born A. A. C. 683. His scholars paid him divine honors; and his doctrine, which consisted chiefly in the transmigration of souls, and in the reverence of cows, was adopted not only in India, but also in Japan, China, Siam, and Tartary. It was propagated, according to M. de Saint Croix, in Thibet, in the eighth century, and succeeded there the ancient religion of Zamolxis. The Samaneans, or Buddists, were entirely destroyed in India by the jealous rage of the Brahmins, whose absurd practices and fables they affected to treat with contempt; but several of their books are still preserved and respected on the coasts of Malabar. Several of the Brahmin orders have also adopted their manner of living, and openly profess the greatest part of their doctrines.

SAMAR, one of the Philippines, situated south-east from the large island of Luzon, from which it is separated by a strait about five leagues in breadth. In length it may be estimated at 140 miles, by sixty the average breadth. In this island the soil is extremely fertile, easily cultivated, and rewards the industry of the laborer with at least forty-fold.

SAMARA, in botany, a genus of the monogynia order, and tetrandria class of plants: CAL. quadripartite: COR. tetrapetalous: stamina immersed in the base of the petal: stigma funnel-shaped. Species four, natives of the East and West Indies, and of the Cape.

SAMARCAND, a great city of Asia, the former capital of Independent Tartary, and, under Timur, of an empire which extended over a great part of this continent. Clavijo, a Spanish ambassador, who visited it about A. D. 1400, estimated the population of the city and suburbs at 150,000. A considerable number, for want of habitations, were obliged to make their habitations in the surrounding rocks. The country, for two leagues round, was entirely covered with large villages, gardens, and country houses, the residence of Tartar chiefs; so that to a stranger approaching, a vast forest seemed to enclose it. Its inland commerce was most extensive. The pomp of Timur's court, and of his numerous palaces, is said to have surpassed description. Our information with regard to the modern state of this once celebrated capital, is very imperfect.

SAMARIA, in ancient geography, one of the three larger districts on this side of the Jordan, situated in the middle between Galilee on the north, and Judea on the south, beginning at the

village Ginæa, in the Campus Magnus, and ending at the toparchy called Acrobatenata. (Josephus). Its soil differed in nothing from that of Judea; both equally hilly and champaign, both equally fertile in corn and fruit (id.): called the kingdom of Samaria in Ephraim (Bible); comprising the ten tribes, and consequently all the country to the north of Judea, and east and west of Jordan. Both the kingdom and city are now called Naplous.

SAMARIA, the capital city of the kingdom of Samaria, or of the ten tribes. It was built by Omri king of Israel, who began to reign A. M. 3079, and died in 3086. 1 Kings xvi. 24. He bought the hill Samaria of Shemer for two talents of silver, or for the sum of £684 : 7 : 6. It took the name of Samaria from Shemer the owner of the hill; though some think there were already some beginnings of a city, because, before the reign of Omri, there is mention made of Samaria (1 Kings xiii. 32) in A. M. 3030. But others take this for a prolepsis, or an anticipation, in the discourse of the man of God, who speaks of Samaria under the reign of Jeroboam. However this be, it is certain that Samaria was no considerable place, and did not become the capital of the kingdom of Israel till after the reign of Omri. Before him, the kings of Israel dwelt at Shechem, or at Tirzah. Samaria was situated upon an agreeable and fruitful hill, and in an advantageous situation, and was twelve miles from Dothaim, twelve from Merom, and four from Atharoth. Josephus says it was a day's journey from Jerusalem. Besides, though it was built upon an eminence, yet it must have had water in abundance; since we find medals struck in this city, wherein is represented the goddess Astarte treading a river under foot. And Josephus says that, when it was taken by John Hyrcanus, he caused the brook to flow over its ruins, to obliterate all marks of it. The kings of Samaria omitted nothing to make the city the strongest, the finest, and the richest, that was possible. Ahab built there a palace of ivory (1 Kings xxii. 39), that is there were many ornaments of ivory in it. Amos describes Samaria under Jeroboam II., as a city sunk into all excesses of luxury and effeminacy. (Amos iii. 15, and iv. 1, 2). Benhadad king of Syria built public places or streets in Samaria (1 Kings xx. 34), probably for traffic, where his people dwelt to promote trade. His son Benhadad besieged it under Ahab (1 Kings xx. 1, 2, 3, &c.) A. M. 3203. In 3204 Benhadad brought an army into the field, but it was again cut in pieces. Some years after this Benhadad came a third time, lay down before Samaria, and reduced it to such necessities by famine that a mother was there forced to eat her own child; but the city was relieved by a sensible exertion of the protection of God. Lastly, it was besieged by Shalmaneser king of Assyria, in the ninth year of Hoshea king of Israel (2 Kings xvii. 6, 7, &c.), and fourth of Hezekiah king of Judah. It was taken three years after, in A. M. 3223. The prophet Hosea speaks of the cruelties exercised by Shalmaneser against the besieged (Hosea x. 4—8); and Micah says that this city was reduced to a heap of stones. (Mic. i. 6). The

Cuthites, who were sent by Esarhaddon to inhabit the country of Samaria, did not think it worth their while to repair the ruins of this city, they dwelt at Shechem, which they made their capital. They were still upon this footing when Alexander the Great came into Phœnicia and Judea. However the Cuthites had rebuilt some of the houses of Samaria, from the time of the return from the captivity, since Ezra then speaks of the inhabitants of Samaria (Ezra iv. 17; Nehem. iv. 2); and the Samaritans, jealous of the favors that Alexander the Great had conferred on the Jews, revolted from him while he was in Egypt, and burnt Andromachus alive, whom Alexander had left governor of Syria. Alexander marched against them, took Samaria, and put in Macedonians to inhabit it; giving the country around it to the Jews; and, to encourage them to cultivate it, he granted them an exemption from tribute. The kings of Egypt and Syria, who succeeded Alexander, deprived them of the property of this country. But Alexander Balas king of Syria restored to Jonathan Maccabæus the cities of Lydda, Ephrem, and Ramatha, which he cut off from the country of Samaria. (1 Mac. x. 30, 38, and xi. 28, 34). Lastly, the Jews re-entered into the full possession of this whole country under John Hyrcanus, the Asmonæan, who took Samaria, and ruined it as above-mentioned. It continued in this condition to A. M. 3937, when Aulus Gabinus was the proconsul of Syria, and gave it the name of Gabiniana. But it was still inconsiderable, till Herod the Great restored it to its ancient lustre, and named it Sebaste, the Greek for Augusta, in honor of Augustus, who had given him the property of it. The sacred authors of the New Testament mention but little of Samaria; and when they do, it is rather of the country about it than of the city. (See Luke xvii. 11; John iv. 4, 5). It was there our Lord had the conversation with a Samaritan woman of Sychar. After the death of St. Stephen (Acts viii. 1, 2, 3), when the disciples were dispersed through Judea and Samaria, St. Philip the deacon withdrew into the city of Samaria, where he made several converts. When the apostles heard that this city had received the word of God, they sent Peter and John thither, to communicate the Holy Ghost to such as had been baptised. There they found Simon Magus. See SIMON. Samaria is never called Sebaste in the New Testament, though strangers hardly knew it but by this name. St. Jerome says that it was thought Obadiah was buried at Samaria. They also showed there the tombs of Elisha and of St. John the baptist. There are found many ancient medals that were struck at Sebaste and Samaria; and some bishops of this city have subscribed to the ancient councils.

SAMARITANS, the people of the city and province of Samaria. In this sense, it should seem that we might give the name of Samaritans to the Israelites of the ten tribes, who lived in the city and territory of Samaria. However, the sacred authors give the name of Samaritans only to those strangers whom the kings of Assyria sent from beyond the Euphrates to inhabit the kingdom of Samaria, when they carried captive the Israelites that were there before. Thus we

may fix the epoch of the Samaritans at the taking of Samaria by Salmaneser, in A. M. 3283. This prince carried away the Israelites, and assigned them dwellings beyond the Euphrates, and in Assyria (2 Kings xvii. 24). He sent other inhabitants in their stead, of whom the most considerable were the Cuthites, a people descended from Cush, and who are probably of the number of those whom the ancients knew by the name of Scythians. See CUTH. His successor Esarhaddon, being informed that the people which had been sent to Samaria were infested by lions (3 Kings xvii. 25), imputed it to their ignorance of the manner of worshipping the god of the country; and sent a priest of the god of Israel that he might teach them the religion of the Hebrews. But they blended this religion with that which they professed before; so they continued to worship their idols, in conjunction with the God of Israel, not perceiving how incompatible these two religions were. It is not known how long they continued in this state; but, at the return from the captivity of Babylon, they had entirely quitted the worship of their idols; and, when they asked permission of the Israelites that they might labor with them at the rebuilding the temple of Jerusalem, they affirmed, that from the time that Esarhaddon had brought them into this country they had always worshipped the Lord. (Ezra iv. 1, 2, 3). And indeed, after the return from the captivity, the scripture nowhere reproaches them with idolatrous worship, though it does not dissemble either their jealousy against the Jews, or the ill offices they had done them at the court of Persia, by their slanders and calumnies, or the stratagems they contrived to hinder the repairing of the walls of Jerusalem. (Nehem. ii. 10, 19; iv. 2, &c.; vi. 1, 2, &c.). It does not appear that there was any temple in Samaria, in common to all those people who came thither from beyond the Euphrates, before the coming of Alexander the Great into Judea. Till then every one was left to his own discretion, and worshipped the Lord where he thought fit. But they soon comprehended, from the books of Moses which they had in their hands, and from the example of the Jews, that God was to be worshipped in that place only which he had chosen. As they could not go to the temple of Jerusalem, which the Jews would not permit, they resolved to build a temple of their own upon Mount Gerizim, near Shechem, their capital. Therefore Sanballat, the governor of the Samaritans, applied to Alexander, as Josephus says, but more probably to Darius Nothus, king of Persia, as Dr. Prideaux supposes (see SANBALLAT); and told him he had a son-in-law, called Manasses, son to Jaddus the high priest of the Jews, who had retired to Samaria with a great number of other persons of his own nation: that he desired to build a temple in this province, where he might exercise the high-priesthood; that this undertaking would be to the advantage of the king's affairs, because, in building a temple in the province of Samaria, the nation of the Jews would be divided, who were a turbulent and seditious people, and by such a division would be made weaker, and less in a condition to undertake new enterprises. The king

readily consented to what Sanballat desired, and the Samaritans presently began their building of the temple of Gerizim, which from that time they have always frequented, and still frequent as the place where the Lord intended to receive the adoration of his people. It is of this mountain, and of this temple, that the Samaritan woman of Sychar spoke to our Saviour. (John iv. 20). See GERIZIM. Josephus adds that the Samaritans did not long continue subject to Alexander; they revolted the very next year, and he drove them out of Samaria, put Macedonians in their room, and gave the province of Samaria to the Jews. This preference that Alexander gave to the Jews contributed not a little to increase that hatred that had already obtained between these two people. When an Israelite had deserved punishment, for the violation of some important point of the law, he took refuge in Samaria. When the Jews were in a prosperous condition, and affairs were favorable to them, the Samaritans called themselves Hebrews, and pretended to be of the race of Abraham. But, when the Jews fell under persecution, the Samaritans disowned them, and acknowledged themselves to be Phœnicians originally. This was their practice in the time of Antiochus Epiphanes. The Samaritans, having received the Pentateuch from the priest that was sent by Esarhaddon, have preserved it to this day, in the same language and character it was then, that is, in the old Hebrew or Phœnician character which we now call the Samaritan, to distinguish it from the modern Hebrew character, at present used in the books of the Jews. These last, after their captivity, changed their old characters, and took up those of the Chaldee, which they had been used to at Babylon, and which they continue to use. It is wrong, says F. Calmet, to give this the name of the Hebrew character, for that can be said properly only of the Samaritan text. The critics have taken notice of some variations between the Pentateuch of the Jews and that of the Samaritans; but these chiefly regard the word Gerizim, which the Samaritans purposely introduced to favor their pretensions, that mount Gerizim was the place in which the Lord was to be adored. The religion of this people was at first the Pagan. Every one worshipped the deity they had been used to (2 Kings xvii. 29.—31). The Babylonians worshipped Succoth-benoth; the Cushites, Nergal; the Hamathites, Ashima: the Avites, Niblaz and Tartak; the Sepharvites, Adrammelech and Anammelech. Afterwards, the Samaritans added that of the Lord, the God of Israel (ibid. 32, 33). But they gave a proof of their little regard to the worship of the true God, when, under Antiochus Epiphanes, they consecrated their temple at Gerizim to Jupiter Argivus. In the time of Alexander the Great, they celebrated the sabbatical year, and consequently the year of jubilee also. Under the kings of Syria they followed the epoch of the Greeks, or that of the Seleucidæ. After Herod had re-established Samaria, and given it the name of Sebaste, the inhabitants, in their medals, and all public acts, took the date of this new establishment. But the old inhabitants of Samaria, of whom the greater part were Pagans or Jews,

were no rule to the other Samaritans, who probably reckoned their years by the reigns of the emperors they were subject to, till they fell under the Mahometans, under whom they live at this day; and they reckon their year by the Hegira, or according to the era of the Ishmaelites. Such as desire to be further acquainted with the history of the ancient Samaritans, we refer to the works of Josephus. As to their religion, it is said that they receive only the Pentateuch, and reject all the other books of scripture, chiefly the prophets, who have expressly declared the coming of the Messiah. They have also been accused of believing God to be corporeal, of denying the Holy Ghost, and the resurrection of the dead. Jesus Christ says (John iv. 22) they worship they know not what. The Samaritan woman is a sufficient testimony that the Samaritans expected a Messiah, who they hoped would clear up all their doubts (John iv. 25). Several of the inhabitants of Shechem believed at the preaching of Jesus Christ, and several of Samaria believed at that of St. Philip. The modern Samaritans are not numerous. Joseph Scaliger, being curious to know their usages, wrote to the Samaritans of Egypt, and to the high-priest of the sect who resided at Neapolis in Syria. They returned two answers to Scaliger, dated in the year of the Hegira 998. These were preserved in the French king's library, and were translated into Latin by Morin, and printed in England in the collection of that father's letters, in 1682, under the title of *Antiquitates Ecclesiæ Orientalis*. By these it appears that they believe in God, in Moses, the holy law, the mountain of Gerizim, the house of God, the day of vengeance and of peace; that they value themselves upon observing the law of Moses in many points more rigidly than the Jews themselves. They keep the sabbath with the utmost strictness, without stirring from the place they are in, but only to the synagogue. They go not out of the city, and abstain from their wives on that day. They never delay circumcision beyond the eighth day. They still sacrifice in the temple on mount Gerizim, and give to the priest what is enjoined by the law. They do not marry their nieces as the Jews do, nor do they allow a plurality of wives. Their hatred for the Jews is testified by Josephus, as well as in the New Testament. (See John iv. 9). The Jewish historian says that one passover night, when they opened the gates of the temple, some Samaritans had scattered the bones of dead men there, to insult the Jews, and to interrupt their devotions. And the Samaritan woman of Sychar was surprised that Jesus talked with her, and asked drink of her, being a Samaritan. When our Saviour sent his apostles to preach in Judea, he forbade them to enter into the Samaritan cities (Matt. x. 5); because he looked upon them as schismatics. One day, when he sent his disciples to provide him a lodging in one of the cities of the Samaritans, they would not entertain him, because they perceived he was going to Jerusalem (Luke ix. 52, 53). And, when the Jews were provoked at the reproaches of Jesus Christ, they told him he was a Samaritan (John viii. 48). Josephus relates that some Samaritans having killed several

Jews, as they were going to the feast at Jerusalem, this occasioned a kind of war between them. The Samaritans continued their fealty to the Romans, when the Jews revolted; yet they did not escape from being involved in some of the calamities of their neighbours. There were, in very modern times, Samaritans at Shechem, otherwise called Naplouse. They had priests of the family of Aaron, as they stated: a high-priest, who resided at Shechem, or at Gerizim, who offered sacrifices there, and who declared the feast of the passover, and all the other feasts, to all the Samaritans. Some of them are said still to be found at Gaza, some at Damascus, and some at Grand Cairo.

SAMBALLAS, a name given to a cluster of islands near the coast of America, in the Spanish Main, of which three groupes are called Cavasas, Mulatas, and Sagua. These islands are scattered at very unequal distances, some only one, some two, some three, and some four miles from the shore and from one another, extending a very considerable distance along the northern shore of the isthmus of Darien.

SAMBUCUS (John), a learned physician, born at Ternau, in Hungary, in 1531. After studying in several universities, his abilities recommended him to the emperors, Maximilian II. and Rodolph II., who successively appointed him counsellor and historiographer. He wrote the Lives of the Roman Emperors, and other works. He died at Vienna, in 1584.

SAMBUCUS, in botany, elder, a genus of the trigynia order, and pentandria class of plants; natural order forty-third, dumose: CAL. quinquepartite: COR. quinquefid; berry trispirmous. The most remarkable species are these:

1. *S. Canadensis*, the Canada shrubby elder, rises with a shrubby stem, branching eight or ten feet high, having reddish shoots, somewhat bipinnated leaves, often ternate below; the other composed of five, seven, or nine oval lobes; and towards the ends of the branches cymose quinquepartite umbels of flowers, succeeded by blackish-red berries.

2. *S. nigra*, the common black elder tree, rises with a tree stem, branching numerously into a large spreading head, twenty or thirty feet high; pinnated leaves, of two or three pairs of oval lobes and one odd one; and large five-parted umbels of white flowers towards the end of the branches, succeeded by bunches of black and other different colored berries, in the varieties; which are, common black-berried elder-tree, white-berried elder, green-berried elder, lacinated, or parsley-leaved elder, having the folioles much lacinated, so as to resemble parsley-leaves, gold-striped leaved elder, silver-striped elder, and silver-dusted elder.

3. *S. racemosa*, racemose, red-berried elder, rises with a tree-like stem, branching ten or twelve feet high, having reddish-brown branches and buds; pinnated leaves of six or seven oval deeply-sawed lobes, and compound, oval, racemous clusters of whitish-green flower, succeeded by oval clusters of red berries. It is common to the mountainous parts of the south of Europe, and is retained in our gardens as a flowering shrub, having a peculiar singularity in

its oval-clustered flowers and berries. All the sorts of elder are of the deciduous kind, very hardy, and grow freely any where; are generally free shooters, but particularly the common elder and its varieties, which make remarkably strong jointed shoots, of several feet in length, in one season; and they flower mostly in summer, except the racemose elder, which generally begins flowering in April; and the branches being large, spreading, and very abundant, are exceedingly conspicuous; but they emit a most disagreeable odor. The flowers are succeeded, in the most of the sorts, by large bunches of ripe berries in autumn, which, though very unpalatable to eat, are in high estimation for making that well known cordial called elder wine, particularly the common black-berried elder. The merit of the elder in gardening may be both for use and ornament, especially in large grounds.

SAME, *adj.* } Sax. *raim*; Goth. and Teut.

SAMENESS, *n. s.* } *same*. Identical; not different; not another; being of the like sort or degree: the noun substantive corresponding.

Miso, as spitefully as her rotten voice could utter it, set forth the *same* sins of Amphialus. *Sidney.*

Difference of persuasion in matters of religion may easily fall out, where there is the *sameness* of duty, allegiance, and subjection. *King Charles.*

Do but think how well the *same* he spends,

Who spends his blood his country to relieve.

Daniel.

The tenor of man's woe

Holds on the *same*. *Milton.*

Th' ethereal vigour is in all the *same*,

And ev'ry soul is filled with equal flame. *Dryden.*

The merchant does not keep money by him; but, if you consider what money must be lodged in the banker's hands, the case will be much the *same*.

Locke.

If itself had been coloured, it would have transmitted all visible objects tinged with the *same* colour, as we see whatever is beheld through a coloured glass appears of the *same* colour with the glass.

Ray on the Creation.

The *same* plant produceth as great a variety of juices as there is in the *same* animal. *Arbuthnot.*

If all courts have a *sameness* in them, things may be as they were in my time, when all employments went to parliamentmen's friends. *Swift.*

SAMIEL, the Arabian name of a hot wind peculiar to the desert of Arabia. It blows over the desert in July and August from the north-west quarter. Some years it does not blow at all, and in others it appears six, eight, or ten times, but seldom continues more than a few minutes at a time. It often passes with the apparent quickness of lightning. The Arabs and Persians have warning of its approach by a thick haze arising out of the horizon: when they instantly throw themselves with their faces to the ground, and continue in that position till the wind has passed, which happens almost instantaneously; but if they are not brisk enough to take this precaution, and they get the full force of the wind, it generally produces death. The Arabs say that this wind always leaves behind it a very strong sulphureous smell, and that the air at these times is quite clear, except about the horizon in the north-west, which gives warning of its approach. SEE ARABIA

SAM'LET, *n. s.* Fr. *salmonet*, or *salmonlet*. A little salmon.

A salmon, after he is got into the sea, becomes from a *samlet*, not so big as a gudgeon, to be a salmon, in as short a time as a gosling becomes a goose. *Walton's Angler*.

SAMNITES, an ancient nation of Italy, who inhabited the country situated between Picenum, Campania, Apulia, and Latium. They distinguished themselves by their implacable enmity against the Romans, in the early ages of that republic; but were at last totally subdued, and, according to some, extirpated, about A.A.C. 272, after a war of seventy-one years. See **ROME**.

SAMOGITIA, or **SZAMAIT**, a tract of Russian Lithuania, forming the north-west part of that great province, and bearing the title of county. It lies to the south of Courland, and to the north of Prussia Proper, having part of its western boundary along the Baltic, but without any harbour of consequence.

SAMOLUS, in botany, round-leaved water pimpernel, a genus of the monogynia order, and pentandria class of plants; natural order twenty-first, *precie*: *cor.* salver-shaped; stamina surrounded by small scales at its throat: *caps.* unilocular inferior. Species four, one of which, *S. valerandi*, is common to the marshes of our country.

SAMON, an island in the eastern seas, lying off Timor to the north-west. It is woody, hilly land, but not mountainous, and towards the south end low. A woody island, called *Tios* in the charts, lies off the south-west point, which is the only thing like danger on the west side; but the tides run strong here, and make formidable riplings.

SAMOS, in ancient geography, an island of Asia, in the *Ægean Sea*, near the promontory *Mycale*, opposite to *Ephesus*; in compass eighty-seven miles according to *Pliny*, or 100 according to *Isidorus*; famous for a temple of *Juno*, with a noted asylum, whence their coin exhibited a peacock. It was the country of *Pythagoras*, who, to avoid the oppression of its tyrants, retired to Italy. *Samos* was first governed by kings, afterwards became a democracy, and at last an oligarchy. It was most flourishing under *Polycrates*. The *Samians* assisted the *Greeks* against *Xerxes*. They were conquered by *Pericles* A.A.C. 441: afterwards by *Eumenes* king of *Pergamus*; but restored to liberty by *Augustus*. *Samos* was reduced to a Roman province under *Vespasian*.

SAMOS, an island of the Grecian archipelag, separated only by a narrow strait from the opposite continent of Asia Minor. See **GREECE**.

SAMOTHRACE, or **SAMOTHRACIA**, in ancient geography, an island in the *Ægean Sea*, opposite the mouth of the *Hebrus*, thirty-two miles from the coast of *Thrace*. It was also called *Dardania*, *Electria*, *Leucania*, *Leucosia*, *Melitis*, and *Samos*; and hence *Samothrace*, or *Thracian Samos*, to distinguish it from *Samos* in Asia Minor. *Pliny* makes it thirty-eight miles in circumference, but modern travellers say it is only twenty. Before the age of the *Argonauts* it was deluged to the top of the highest mountains by a sudden inundation of the *Euxine*. It was anciently go-

vern'd by kings, but, like most other states in Greece, became afterwards democratic. The people enjoyed all their rights and privileges under the Romans till the reign of *Vespasian*. By him it was reduced, with the other islands in the *Ægean Sea*, to the form of a Roman province. It is now under the Turks, and by them named *Samandrachi*.

SAMOYEDES, a savage race who traverse the immense and frozen deserts extending along the northern coast of Asia. They do not recognise themselves by this name, which has been given to them by the Russians, but call themselves *Khasova*. They extend, on the European side, as far as the river *Mesen*, which falls into the *White Sea*; while they inhabit the shores of Asia, eastward to the *Olenek*, and almost to the *Lena*: thus filling up the space between 40° and 120° of E. long., a line of upwards of 2000 miles. The whole of this vast extent is not supposed to contain a population of more than 20,000. They are divided into three great tribes: the *Vanoites*, who inhabit the banks of the *Petchora* and the *Obi*, in the vicinity of *Obdorsk*; the *Tysia-Igoley*, who are found on the *Mesen*, and in the interior of the government of *Archangel*; and the *Khirutchies*, who fill the remoter and interior parts of *Siberia*. The rude traditions concerning their origin seem to support the conjecture that they were driven hither, by war and oppresson, from happier climates.

Like other tribes of these ungenial climates, they are a small and stunted race, commonly between four and five feet high. They have a flat, round, broad face, large thick lips, a wide and open nose, little beard, and black and rough hair in small quantity, carefully arranged. The dress of the men differs little from that of the *Ostiaks*; but they are reckoned more savage, and are very superstitious.

SAMP, a dish said to have been invented by the savages of North America, who have no corn mills. It is Indian corn deprived of its external coat by soaking it ten or twelve hours in a lixivium of water and wood-ashes. This coat or husk, being separated from the kernel, rises to the surface of the water, while the grain, which is specifically heavier than water, remains at the bottom of the vessel; which grain, thus deprived of its hard coat of armour, is boiled, or rather simmered, for two days, in a kettle of water near the fire. When sufficiently cooked, the kernels swell to a great size and burst open; and this food, which is uncommonly sweet and nourishing, may be used in a variety of ways; but the best way is to mix it with milk, and with soups and broths, as a substitute for bread. It is even better than bread for these purposes; for, besides being quite as palatable as the very best bread, it is less liable than bread to grow very soft when mixed with these liquids.

SAM'PHIRE, *n. s.* Fr. *saint Pierre*; Lat. *crithmum*. A plant preserved in pickle.

Half way down

Hangs one that gathers *samphire*: dreadful trade!
Methinks he seems no bigger than his head.

Shakspeare

This plant grows in great plenty upon the rocks near the sea-shore, where it is washed by the salt

water. It is greatly esteemed for pickling, and is sometimes used in medicine. *Miller.*

SAMPHIRE. See CRITHUM.

SAMPLE, *n. s.* } Corrupted from example
SAMPLER. } and exemplar. A specimen; part of the whole shown, that judgment may be made of the whole: a pattern of work.

O love, why dost thou in thy beautiful *sampler* set such a work for my desire to set out, which is impossible? *Sidney.*

Fair Philomela, she but lost her tongue,
And in a tedious *sampler* sewed her mind. *Shakespeare.*

We created with our needles both one flower,
Both on one *sampler*, sitting on one cushion;
Both warbling of one song, both in one key,
As if our hands, our sides, voices, and minds
Had been incorporate. *Id.*

He entreated them to tarry but two days, and he himself would bring them a *sample* of the ore. *Raleigh.*

Coarse complexions,
And cheeks of sorry grain, will serve to ply
The *sampler*, and to tease the housewife's wool. *Milton.*

I have not engaged myself to any: I am not loaded with a full cargo: 'tis sufficient if I bring a *sample* of some goods in this voyage. *Dryden.*

Determinations of justice were very summary and decisive, and generally put an end to the vexations of a law-suit by the ruin both of plaintiff and defendant: travellers have recorded some *samples* of this kind. *Addison.*

From most bodies
Some little bits ask leave to flow;
And, as through these canals they roll,
Bring up a *sample* of the whole. *Prior.*
I design this but for a *sample* of what I hope more fully to discuss. *Woodward.*
I saw her sober over a *sampler*, or gay over a jointed baby. *Pope.*

SAMSON, the son of Manoah, of the tribe of Dan, and a judge of Israel. The extraordinary circumstances of his birth, life, miraculous strength, marriage, repeated defeats of the Philistines, captivity, and death, are recorded in Judges xiii.—xvi. He judged Israel twenty years. Chronologists place his death in A. M. 2887, or A. A. C. 1117: Milton wrote a beautiful poem on his history, entitled *Samson Agonistes*.

SAMSON'S PEST, a sort of pillar erected in a ship's hold, between the lower deck and the keelson, under the edge of a hatchway, and furnished with several notches that serve as steps to mount or descend, as occasion requires. This post, being firmly driven into its place, not only serves to support the beam and fortify the vessel in that place, but also to prevent the cargo or materials contained in the hold from shifting to the opposite side by the rolling of the ship in a turbulent or heavy sea.

SAMSOON, a city of Asia Minor, on the Black Sea, and on the site of the ancient Amisus, which, after Sinope, was the most opulent city in Pontus. It is situated near the west end of a bay, about four miles in length, and surrounded by olive trees. The houses, which are made of wood, plastered with mud, and white-washed, produce a good effect. The modern town is small, surrounded by a decayed wall, which,

from the form of the arches of the gates, and some ancient pieces of sculpture, intermixed with the other stones, appears to have been built by the Turks: but the town can boast of five mosques, with minarets, and a large khan for the use of merchants. The ships belonging to the port are navigated by the Greeks; adjoining villages are inhabited chiefly by Christians. Inhabitants 2000.

SAMUEL, an eminent inspired prophet, historian, and judge of Israel, and the last judge that commonwealth. He was the son of Elkanah, a Levite of the family of Kohath, by his beloved wife Hannah. The extraordinary circumstances preceding his birth; his early dedication to God by his mother, with her beautiful hymn on that occasion; the revelations communicated to him by the Almighty; his reformation of the people, and their consequent victory over the Philistines; the conduct of his sons, which excited the people to desire a change of government; his description of the character of a king; his anointing of Saul their first monarch; his appeal to the people respecting his own just government; his repeated reproofs of king Saul for his improper conduct; his just punishment of the murderous monarch of the Amalekites; his anointing of David; and his death,—are recorded 1 Sam. i.—xxv. He is reckoned the author of the books of Judges and Ruth.

SAMUEL, THE BOOKS OF, two canonical books of the Old Testament. The books of Samuel and the books of Kings are a continued history of the reigns of the kings of Israel and Judah; for which reason the books of Samuel are likewise styled the first and second book of Kings. Since the first twenty-four chapters contain all that relates to the history of Samuel, and the latter part of the first book and all the second include the relation of events that happened after the death of that prophet, it has been supposed that Samuel was author of the first twenty-four chapters, and that the prophets Gad and Nathan finished the work. The first book of Samuel comprehends the transactions under the government of Eli and Samuel, and under Saul the first king; and also the acts of David while he lived under Saul. The second book is wholly spent in relating the transactions of David's reign.

SAMYDA, in botany, a genus of the monogynia order, and decandria class of plants: *cal.* quinquepartite and colored: *cor.* none: *caps.* the inside resembles a berry, is trivalved and unilocular: the seeds nestling. Species ten, natives of the East and West Indies.

SANADON (Noël Stephen), a Jesuit, born at Rouen in 1676, and a distinguished professor of humanity at Caen. He there became acquainted with Huet bishop of Avranches, afterwards his intimate friend. Sanadon next taught rhetoric at the university of Paris, and was entrusted with the education of the prince of Conti after the death of Du Morcean. In 1728 he was made librarian to Louis XIV., an office which he retained to his death. He died on the 21st September 1733, in the fifty-eighth year of his age. His works are, 1. Latin Poems, in 12mo., 1715, and by Barbou, in 8vo., 1754. These consist of Odes, Elegies, Epigrams, &c. 2. A

Translation of Horace, with Remarks, in 2 vols. 4to., Paris, 1727; best edition Amsterdam, 1735, in 8 vols. 12mo.; with the notes of M. Dacier. Sanadon translated with elegance and taste; but his version is rather a paraphrase than a faithful translation. 3. A collection of Discourses; and 4. Prieres et Instructions Chretiennes.

SANATIVE, *adj.* ? Lat. *sano*. Powerful
SANATION, *n.s.* **S** to cure; healing: the act of curing.

The vapour of coltsfoot hath a *sanative* virtue towards the lungs. *Bacon's Natural History.*

Consider well the member, and, if you have no probable hope of *sanation*, cut it off quickly.

Wiseman's Surgery.

SANBALLAT, the governor of the Samaritans, a great enemy to the Jews. He was a native of Horon, or Horonaim, a city beyond Jordan, in the country of the Moabites. He lived in the time of Nehemiah, who was his great opponent, and from whose book we learn his history. There is one circumstance related of him by Josephus which has occasioned some dispute among the learned. According to that author, when Alexander the Great came into Phœnicia, and sat down before the city of Tyre, Sanballat quitted the interests of Darius king of Persia, and went at the head of 8000 men to offer his services to Alexander. This prince readily entertained him, and, at his request, gave him leave to erect a temple upon mount Gerizim, where he constituted his son-in-law Manasseh the high-priest. But this is a flagrant anachronism; for 120 years before this, that is, in A. M. 3550, Sanballat was governor of Samaria; wherefore the learned Dr. Prideaux (in his *Connexion of the Histories of the Old and New Testament*) supposes two Sanballats, and endeavours to show it to be a mistake of Josephus, in making Sanballat to flourish in the time of Darius Codomannus, and to build his temple upon mount Gerizim by license from Alexander the Great; whereas this was performed by leave from Darius Nothus, in the fifteenth year of his reign.

SANCHES (Anthony Nunes Ribeiro), M. D., a learned physician, born at Penna-Macor in Portugal, in 1699. His father, an opulent merchant, gave him a liberal education, intending him for the law, and, on finding him prefer physic, withdrew his protection; on which his maternal uncle, Dr. Nunes Ribeiro, a physician at Lisbon, furnished him with the means of prosecuting his studies, at Coimbra and Salamanca; where he took his degree in 1724. In 1725 he was appointed physician to the town of Benevente. About 1727 he came over to London, where he spent two years; after which he studied at Leyden under Boerhaave; who, in 1731, recommended him to the empress Anne of Russia. On his arrival at Petersburg Dr. Bidloo, then first physician to the empress, gave him an appointment in the hospital at Moscow, where he continued till 1734, when he was appointed physician to the army, and was present at the siege of Asoph. In 1740 he was appointed one of the physicians to the empress, who had labored eight years under a disease which he asserted to be a stone in the kidney. His opinion was confirmed at her death, six months after, upon open-

ing her. The regency that succeeded appointed him first physician; but the revolution of 1742, which placed Elizabeth on the throne, deprived him of all his employments. Hardly a day passed that he did not hear of some of his friends being executed; and it was with difficulty that he obtained leave to retire from Russia. In 1747 he went to Paris, where he continued till October 14th, 1783, when he died. His printed works, on the Origin of the Venerable Disease, and other subjects, are well known to the faculty. He was a member of the Royal Medical Society at Paris, and of the Royal Academy of Lisbon, to the establishment of which he had contributed.

SANCHEZ (Francis), in Latin Sanctius, was of Las Brocas in Spain. He wrote, 1. An excellent treatise entitled *Minerva, or De Causis Linguae Latinae*, which was published at Amsterdam in 1714, in 8vo. The authors of the *Port-royal Methode de la Langue Latine* have been much indebted to this work. 2. *The Art of Speaking*, and the *Method of Translating Authors*. 3. Several other learned pieces on grammar. He died in 1600, in his seventy-seventh year.

SANCHEZ (Francis), a Portuguese physician, who settled at Toulouse, and, though a Christian, was born of Jewish parents. He is said to have been a man of genius and a philosopher. His works have been collected under the title of *Opera Medica*. His *uncti sunt tractatus quidam philosophici non insubtiles*. They were printed at Toulouse in 1636; where Sanchez died in 1632.

SANCHONIATHO, or **SANCHONIATHON**, a Phœnician philosopher and historian, who is said to have flourished before the Trojan war, about the time of Semiramis. Of this most ancient writer the only remains extant are fragments of cosmogony, and of the history of the gods and first mortals, preserved by Eusebius and Theodoret; both of whom speak of Sanchoniatho as an accurate and faithful historian; and the former adds that his work, which was translated by Philo Byblius from the Phœnician into the Greek language, contains many things relating to the history of the Jews which deserve great credit, both because they agree with the Jewish writers, and because the author received these particulars from the annals of Hierombalus, a priest of the god Jao. Several modern writers, however, of great learning, have called in question the very existence of Sanchoniatho, and have contended that the fragments which Eusebius adopted as genuine, upon the authority of Porphyry, were forged by that author, or the pretended translator Philo, from enmity to the Christians, that the Pagans might have something to show of equal antiquity with the books of Moses. These opposite opinions have produced a controversy that has filled volumes. We can, however, only refer such of our readers as are desirous of fuller information to the works of Bochart, Scaliger, Vossius, Cumberland, Dodwell, Stillingfleet, Mosheim, Cudworth, and Warburton. The controversy respects two questions, 1. Was there in reality such a writer? 2. Was he of the very remote antiquity which his translator claims for him?

That there was really such a writer, and that

the fragments preserved by Eusebius are indeed parts of his history, interpolated perhaps by the translator, we are fully persuaded. Eusebius, who admitted them into his work as authentic, was one of the most learned men of his age. He had better means than any modern writer can have of satisfying himself with respect to the authenticity of a very extraordinary work, which had then but lately been translated into the Greek language, and made generally known; and there is nothing in the work itself, or at least in those parts of it which he has preserved, that could induce a wise and good man to obtrude it upon the public as genuine, had he himself suspected it to be spurious. Too many of the Christian fathers were indeed very credulous, and ready to admit the authenticity of writings without duly weighing the merits of their claim; but then such writings were always believed to be favorable to the Christian cause, and inimical to Paganism. That no man of common sense could suppose the cosmogony of Sanchoniatho favorable to the cause of revealed religion, a further proof cannot be required than the following extract:—‘He affirms that the principles of the universe were a dark and windy air, or a wind made of dark air, and a turbulent evening chaos; and that these things were boundless, or for a long time had no bound or figure. But when this wind fell in love with its own principles, and a mixture was made, that mixture was called desire, or Cupid (*πῶθος*). This mixture completed was the beginning of the (*κρίσις*) making of all things. But that wind did not know its own production; and of this, with that wind, was begotten mot, which some call mud, others the putrefaction of a watery mixture. And of this came all the seed of this building, and the generation of the universe. But there were certain animals which had no sense, out of which were begotten intelligent animals, and were called Zophesemin, that is, the spies or overseers of heaven; and were formed alike in the shape of an egg. Thus shone out mot, the sun and the moon, the less and the greater stars. And the air shining thoroughly with light, by its fiery influence on the sea and earth, winds were begotten, and clouds and great defluxions of the heavenly waters. And all these things first were parted, and were separated from their proper place by the heat of the sun, and then all met again in the air, and dashed against one another, and were so broken to pieces; whence thunders and lightnings were made; and at the stroke of these thunders the fore-mentioned intelligent animals were awakened, and frightened with the sound; and male and female stirred in the earth and in the sea.’ This is their generation of animals. After these things Sanchoniatho goes on saying: ‘These things are written in the Cosmogony of Taantes, and in his memoirs; and out of the conjectures, and surer natural signs which his mind saw, and found out, and wherewith he hath enlightened us.’ Afterwards declaring the names of the winds north and south, and the rest, he makes this epilogue: ‘But these first men consecrated the plants shooting out of the earth, and judged them gods, and worshipped them; upon whom they themselves lived, and

all their posterity and all before them; to these they made their meat and drink offerings.’ Then he concludes, ‘These were the devices of worship agreeing with the weakness and want of boldness in their minds.’ Let us suppose Eusebius to have been as weak and credulous as the darkest monk in the darkest age of Europe, a supposition which no man will make who knows any thing of his writings, what could he see in this senseless jargon which even a dreaming monk would think of employing in support of Christianity? Eusebius justly styles it direct atheism, but could he imagine that an ancient system of atheism would contribute so much to make the Pagans of his age admit as divine revelations the books of the Old and New Testaments, that he should be induced to adopt, without examination, an impudent forgery not 200 years old as genuine remains of the most remote antiquity? If this Phœnician cosmogony be a fabrication of Porphyry, or of the pretended translator, it must surely have been fabricated for some purpose; but it is impossible to conceive what purpose either of these writers could have intended to serve by forging a system so extravagantly absurd. Porphyry, though an enemy to the Christians, was not an atheist, and would never have thought of making an atheist of him whom he meant to obtrude upon the world as the rival of Moses. His own principles were those of the Alexandrian Platonists; and, had he been the forger of the works which bear the name of Sanchoniatho, instead of the incomprehensible jargon about dark wind, evening chaos, mot, the overseers of heaven in the shape of an egg, and animation proceeding from the sound of thunder, we should doubtless have been amused with refined speculations concerning the operations of the Demiurgus and other persons in the Platonic Triad. See PLATONISM, and PORPHYRY. F. Simon of the oratory imagines (Bib. Crit. vol. i. p. 140) that the purpose for which the history of Sanchoniatho was forged was to support paganism, by taking from it its mythology and allegories, which were perpetually objected to it by the Christian writers; but this learned man totally mistakes the matter. The primitive Christians were too much attached to allegories themselves to rest their objections to Paganism on such a foundation; what they objected to that system was the immoral stories told of the gods. To this the Pagan priests and philosophers replied, that these stories were only mythologic allegories, which veiled all the great truths of theology, ethics, and physics. The Christians said this could not be; for that the stories of the gods had a substantial foundation in fact, these gods being only dead men deified, who in life had like passions and infirmities with other mortals. This then was the objection which the forger of the works of Sanchoniatho had to remove, if he really forged them in support of Paganism; but, instead of doing so, he gives the genealogy and history of all the greater gods, and shows that they were men deified after death for the exploits, some of them grossly immoral, which they had performed in this world. We have elsewhere given his account of the deification of Chrysor, and Ouranos, and Ge, and Hypsistos, and Muth;

but our readers may wish to accompany him through the history of Ouranos and Chronus, two of his greatest gods; whence it will appear how little his writings are calculated to support the tottering cause of Paganism against the objections urged to it by the Christian apologists. 'Ouranos,' says he, 'taking the kingdom of his father, married Ge his sister, and by her had four sons; Ilus, who is called Chronus; Betylus; Dagon who is Siton, or the god of corn; and Atlas. But by other wives Ouranos had much issue, wherefore Ge, being grieved at it and jealous, reproached Ouranos, so that they parted from each other. But Ouranos, though he parted from her, yet by force invading her, and lying with her when he listed, went away again; and he also attempted to kill the children he had by her. Ge also often defended or avenged herself, gathering auxiliary powers unto her. But when Chronus came to man's age, using Hermes Trismegistus as his counsellor and assistant (for he was his secretary), he opposed his father Ouranos, avenging his mother. But Chronus had children, Persephone and Athena; the former died a virgin, but by the council of the latter Athena, and of Hermes, Chronus made of iron a scimitar and a spear. Then Hermes, speaking to the assistants of Chronus with enchanting words wrought in them a keen desire to fight against Ouranos in the behalf of Ge; and thus Chronus warring against Ouranos, drove him out of his kingdom, and succeeded in the imperial power. In the fight was taken a well-beloved concubine of Ouranos big with child. Chronus gave her in marriage to Dagon, and she brought forth at his house what she had in her womb by Ouranos, and called him Demaroon. After these things Chronus builds a wall round about his house, and founds Byblus the first city in Phenicia. Afterwards Chronus, suspecting his own brother Atlas, with the advice of Hermes, throwing him into a deep hole of the earth, there buried him, and having a son called Sadid, he despatched him with his own sword, having a suspicion of him, and deprived his own son of life with his own hand. He also cut off the head of his own daughter, so that all the gods were amazed at the mind of Chronus. But, in process of time, Ouranos being in banishment, sends his daughter Astarte, with two other sisters Rhea and Dione, to cut off Chronus by deceit, whom Chronus taking, made wives of these sisters. Ouranos, understanding this, sent Eimarmene and Hore, Fate and Beauty, with other auxiliaries, to war against him; but Chronus, having gained the affections of these also, kept them with himself. Ouranos devised Bætulia, contriving stones that moved as having life. But Chronus begat on Astarte seven daughters, called Titanides or Artemides; and he begat on Rhea seven sons, the youngest of whom, as soon as he was born, was consecrated a god. Also by Dione he had daughters, and by Astarte two sons, Pothos and Eros, i. e. Cupid and Love. But Dagon, after he had found out bread, corn, and the plough, was called Zeus Aratrius. To Sedyc, or the just, one of the Titanides bare Asclepius. Chronus had also in Peræa three sons: 1. Chronus, his father's namesake. 2. Zeus Belus. 3. Apollo.' Is it con-

ceivable that a writer so acute as Porphyry, or indeed that any man of common sense, would forge a book filled with such stories as these, to remove the Christian's objections to the immoral characters of the Pagan divinities? The supposition is impossible. Nor is Sanchoniatho here writing allegorically, and by his tales of Ouranos, and Ge, and Chronus, only personifying the heaven, the earth, and time. On the contrary, he assures us that Ouranos, or Epigeus, or Autochthon, was the son of one Eliaon or Hypsistos, who dwelt about Byblus, and that from him the element which is over us was called heaven, on account of its excellent beauty, as the earth was named Ge after his sister and wife. And his translator is very angry with the Neoteric Greeks, as he calls them, because that, 'by a great deal of force and straining, they labored to turn all the stories of the gods into allegories and physical discourses.' This proves that the author of this book did not mean to veil the great truths of religion under the cloak of mythologic allegories; and therefore, if it was forged by Porphyry in support of Paganism, the forger so far mistook the state of the question between him and his adversaries, that he contrived a book, which, if admitted to be ancient, totally overthrew his own cause. The next enquiry with respect to Sanchoniatho is his antiquity. Did he really live and write at so early a period as Porphyry and Philo pretend? We think he did not; and what confirms our opinion is that mark of national vanity and partiality in making the sacred mysteries of his own country original, and conveyed from Phœnicia into Egypt. This, however, furnishes an additional proof that Porphyry was not the forger of the work; for he well knew that the mysteries had their origin in Egypt (see MYSTERIES), and would not have fallen into such a blunder. He is guilty, indeed, of a very great anachronism, when he makes Sanchoniatho contemporary with Semiramis, and yet pretends that what he writes of the Jews is compiled from the records of Hierombalus the priest of the god Jao; for Bochart has made it appear highly probable that Hierombalus or Jerom-baal is the Jerub-baal or Gideon of Scripture. Between the reign of Semiramis and the Trojan war a period elapsed of nearly 800 years, whereas Gideon flourished not above seventy years before the destruction of Troy. But, supposing Sanchoniatho to have really consulted the records of Gideon, it by no means follows that he flourished at the same period with that judge of Israel. His atheistic cosmogony he does not indeed pretend to have got from the priest of Jao, but from records deposited in his own town of Berytus by Thoth, a Phœnician philosopher, who was afterwards king of Egypt. Still less indeed thinks it most probable that Sanchoniatho became acquainted with the most remarkable passages of the life of Jerub-baal from annals written by a Phœnician pen. He observes that, immediately after the death of Gideon, the Israelites, with their usual proneness to idolatry, worshipped Baal-berith, or the idol of Berytus, the town in which Sanchoniatho lived; and from this circumstance he concludes that there must have been such an intercourse between the Hebrews

and Berytians, that in process of time the latter people might assume to themselves the Jerubbaal of the former, and hand down his actions to posterity as those of a priest instead of a great commander. All this may be true; but, if so, it amounts to a demonstration, that the antiquity of Sanchoniatho is not so high by many ages as that which is claimed for him by Philo and Porphyry, though he may still be more ancient, as we think Vossius has proved him to be, than any other profane historian whose writings have come down to us, either entire or in fragments. (De Hist. Græc. lib. i. c. 1). But, granting the authenticity of Sanchoniatho's history, what, it may be asked, is the value of his fragments, that we should take the trouble to ascertain whether they be genuine remains of high antiquity, or the forgeries of a modern impostor? We answer, with the illustrious Stillingfleet, that though those fragments contain such absurdities as it would be a disgrace to reason to suppose credible; though the whole cosmogony is the grossest sink of atheism; and though many persons make a figure in the history, whose very existence may be doubted; yet we, who have in our hands the light of divine revelation, may in this dungeon discover many excellent relics of ancient tradition, which throw no feeble light upon many passages of Holy Scripture, as they give us the origin and progress of that idolatry which was so long the opprobrium of human nature. They furnish too a complete confutation of the extravagant chronology of the Chaldeans and Egyptians, and show, if they be genuine, that the world is indeed not older than it is said to be by Moses. We would therefore recommend to our readers an attentive perusal of Cumberland's Sanchoniatho.

SANCROFT (William), archbishop of Canterbury, was born at Fressingfield, in Suffolk, in 1616; and admitted into Emanuel College, Cambridge, in 1633. In 1642 he was elected a fellow; and, for refusing to take the covenant, was ejected. In 1660 he was chosen one of the university preachers; in 1663 was nominated dean of York; and in 1664 dean of St. Paul's. In this station he began to repair the cathedral, till the fire of London in 1666 employed his thoughts on the more noble undertaking of rebuilding it, toward which he gave £1400. He also rebuilt the deanery, and improved the revenue of it. In 1668 he was admitted archdeacon of Canterbury on the king's presentation. In 1677, being prolocutor of the convocation, he was promoted to be archbishop of Canterbury. In 1678 he was committed to the Tower with six other bishops, for presenting a petition to king James against reading the declaration of indulgence. Upon the king withdrawing himself, he concurred with the lords in a declaration to the prince of Orange for a free parliament, and due indulgence to the protestant dissenters. But, when that prince and his consort were declared king and queen, his grace, refusing to take the oaths, was suspended and deprived. He lived privately till his death in 1693. His learning, integrity, and piety, made him an exalted ornament of the church. He published a volume in 12mo., entitled *Modern Politics*, taken from

Machiavel, Borgia, and other authors; *Familiar Letters to Mr. North*, an 8vo. pamphlet, and three of his sermons were printed together after his death.

SANCTIFY, <i>v. a.</i>	} Fr. <i>sanctifier</i> ; Lat. <i>sanctifico</i> . To make holy; free from sin, or moral taint; make a means of holiness; secure from pollution or violation: sanctification and sanctifier correspond with the
SANCTIFICATION, <i>n. s.</i>	
SANCTIFIER,	
SANCTIMONIOUS, <i>adj.</i>	
SANCTIMONY, <i>n. s.</i>	
SANCTITUDE,	
SANCTITY,	} verb: sanctimonious is having the appearance of sanctity or sanctitude, which are synonymous, and signify holiness; goodness; godliness: to sanctuarize is to shelter under sacred privileges (obsolete): a sanctuary is a holy place; the most sacred part of a temple or place of worship; place of protection; asylum; shelter.
SANCTUARIZE, <i>v. a.</i>	
SANCTUARY, <i>n. s.</i>	

For if the blood of bulls, sprinkling the unclean, *sanctifieth* to the purifying of the flesh, how much more shall the blood of Christ! *Heb. ix. 13.*

The grace of his *sanctification* and life, which was first received in him, might pass from him to his whole race, as malediction came from Adam unto all mankind. *Hooker.*

The gospel, by not making many things unclean, as the law did, hath *sanctified* those things generally to all, which particularly each man to himself must *sanctify* by a reverend and holy use. *Id.*

Her pretence is a pilgrimage, which holy undertaking, with most austere *sanctimony*, she accomplished. *Shakspeare.*

At his touch,

Such <i>sanctity</i> hath heaven given his hand,	<i>Id.</i>
They presently amend.	<i>Id.</i>
No place indeed should murder <i>sanctuarise</i> .	<i>Id.</i>
Come, my boy, we will to <i>sanctuary</i> .	<i>Id.</i>
Oft have I heard of <i>sanctuary</i> men;	
But <i>sanctuary</i> children ne'er 'till now.	<i>Id.</i>

There was great reason why all discreet princes should beware of yielding hasty belief to the robes of *sanctimony*. *Raleigh.*

He fled to Beverly, where he and divers of his company registered themselves *sanctuary* men. *Bacon's Henry VII.*

Those judgments God hath been pleased to send upon me, are so much the more welcome, as a means which his mercy hath *sanctified* so to me as to make me repent of that unjust act. *King Charles.*

In their looks divine

The image of their glorious maker shone,	
Truth, wisdom, <i>sanctitude</i> , serene and pure.	<i>Milton.</i>

God attributes to place

No <i>sanctity</i> , if none be thither brought	
By men who there frequent.	<i>Id.</i>
About him all the <i>sanctities</i> of heav'n	
Stood thick as stars, and from his sight received	
Beatitude past utterance.	<i>Id.</i>

They often plac'd

Within his <i>sanctuary</i> itself their shrines.	<i>Id.</i>
The bishop kneels before the cross, and devoutly adores and kisses it: after this follows a long prayer for the <i>sanctification</i> of that new sign of the cross.	

Stillingfleet.

The holy man, amazed at what he saw,
Made haste to *sanctify* the bliss by law. *Dryden.*

The admirable works of painting were made fuel for the fire; but some reliques of it took *sanctuary* under ground, and escaped the common destiny. *Id. Dufresnoy.*

A *sanctimonious* pretence, under a pomp of form, without the grace of an inward integrity, will not serve the turn. *L'Estrange.*

What are the bulls to the frogs, or the lakes to the meadows ?—Very much, says the frog ; for he that's worsted will be sure to take *sanctuary* in the fens. *Id.*

Those external things are neither parts of our devotion, or by any strength in themselves direct causes of it ; but the grace of God is pleased to move us by ways suitable to our nature, and to *sanctify* these sensible helps to higher purposes. *South.*

What actions can express the entire purity of thought, which refines and *sanctifies* a virtuous man ? *Addison.*

It was an observation of the ancient Romans, that their empire had not more increased by the strength of their arms than the *sanctity* of their manners. *Id.*

Let it not be imagined that they contribute nothing to the happiness of the country who only serve God in the duties of a holy life, who attend his *sanctuary*, and daily address his goodness. *Roger's Sermons.*

To be the *sanctifier* of a people, and to be their God, is all one. *Derham's Physico-Theology.*

Truth guards the poet, *sanctifies* the line. *Pope.*

SANCTION, *n. s.* Fr. *sanction* ; Lat. *sanctio*. The confirmation which gives to any thing its obligatory power ; ratification.

I have killed a slave,
And of his blood caused to be mixed with wine :
Fill every man his bowl. There cannot be
A fitter drink to make this *sanction* in. *Ben Jonson.*

Against the public *sanctions* of the peace,
With fates averse, the rout in arms resort,
To force their monarch. *Dryden's Æneis.*

There needs no positive law or *sanction* of God to stamp an obliquity upon such a disobedience. *South.*

This word is often made the *sanction* of an oath : it is reckoned a great commendation to be a man of honour. *Swift.*

The satisfactions of the Christian life, in its present practice and future hopes, are not the mere raptures of enthusiasm, as the strictest professors of reason have added the *sanction* of their testimony. *Watts.*

Wanting *sanction* and authority, it is only yet a private work. *Baker on Learning.*

SANCTORIUS, or **SANTORIUS**, an ingenious and learned physician, was a professor in the university of Padua in the beginning of the seventeenth century. He contrived a kind of weighing chair, by means of which, after estimating the aliments received, and the sensible discharges, he was enabled to determine with great exactness the quantity of insensible perspiration, &c. On these experiments he erected a curious system, which he published under the title of *De Medicina Statica*, of which we have an English translation by Dr. Quincy. **SANCTORIUS** published several other treatises, which showed great abilities and learning.

SANCTUARY, among the Jews, also called *sanctum sanctorum*, or holy of holies, was the holiest and most retired part of the temple of Jerusalem, in which the ark of the covenant was preserved, and into which none but the high priest was allowed to enter, and that only once a-year, to intercede for the people. Some dis-

tinguish the sanctuary from the *sanctum sanctorum*, and maintain that the whole temple was called the sanctuary. To try and examine any thing by the weight of the sanctuary, is to examine it by a just and equal scale ; because, among the Jews, it was the custom of the priests to keep stone weights, to serve as standards for regulating all weights by, though these were not at all different from the royal or profane weights.

SANCTUARY, in the Romish church, is also used for that part of the church in which the altar is placed, encompassed with a rail or balustrade.

SANCTUS, **SANCUS**, or **SANGUS**, a deity of the Sabines, introduced among the gods of ancient Rome, by the name of *deus fidius*. He was the father of *Sabinus*, the first king of the Sabines.

SAND , <i>n. s.</i>	} Sax. <i>rand</i> ; and all the northern languages. Particles of loam, stone, or gravelly earth ; in fact, sundered stone : hence barren country covered with sand : sandblind, having a disease in which sand, or small matters, appears to fly before the sight : sanded is, covered with sand ; barren ; marked with small spots : sandish, loose ; having the nature of sand : sandstone, stone that easily crumbles to sand : sandy, abounding with, or like, sand ; loose.
SAND'BLIND , <i>adj.</i>	
SAND'ED ,	
SAND'ISH ,	
SANDSTONE , <i>n. s.</i>	
SAND'Y , <i>adj.</i>	

Most of his army being slain, he, with a few of his friends, sought to save themselves by flight over the desert sands. *Knolles.*

Here i' the' sands
Thee I'll rake up, the most unsanctified. *Shakspeare.*

My true begotten father, being more than *sand-blind*, high gravelblind, knows me not. *Id. Merchant of Venice.*

My hounds are bred out of the Spartan kind,
So flewed, so *sanded*, and their heads are hung
With ears that sweep away the morning dew. *Shakspeare.*

Safer shall he be on the *sandy* plains,
Than where castles mounted stand. *Id.*

Sand hath always its root in clay, and there be no veins of *sand* of any great depth within the earth. *Bacon.*

Favour, so bottomed upon the *sandy* foundation of personal respects only, cannot be long lived. *Bacon to Villiers.*

Her sons spread
Beneath Gibraltar to the Libyan sands. *Milton.*

Engaged with money bags, as bold
As men with *sand* bags did of old. *Hudibras.*

A region so desert, dry, and *sandy*, that travellers are fain to carry waters on their camels. *Broune's Vulgar Errors.*

Calling for more paper to scribe, king Philip
shewed him the difference betwixt the ink box and
sand box. *Howel.*

If quicksilver be put into a convenient glass vessel, and that vessel exactly stopped, and kept for ten weeks in a *sand* furnace, whose heat may be constant, the corpuscles that constitute the quicksilver will, after innumerable revolutions, be so connected to one another, that they will appear in the form of a red powder. *Boyle.*

The force of water casts gold out from the bowels of mountains, and exposes it among the sands of rivers. *Dryden.*

In well *sanded* lands little or no snow lies. *Mortimer.*

Rough unwieldy earth, nor to the plough
Nor to the cattle kind, with *sandy* stones
And gravel o'er-binding.

Philips.

Plant the tenuifolia's and ranunculus's in fresh
sandish earth, taken from under the turf.

Evelyn.

So, where our wild Numidian wastes extend,
Sudden the' impetuous hurricanes descend,
Wheel through the air, in circling eddies play,
Tear up the *sands*, and sweep whole plains away.
The helpless traveller with wild surprise,
Sees the dry desert all around him rise,
And smothered in the dusty whirlwind dies.

Addison.

Celia and I, the other day,
Walked o'er the *sand* hills to the sea.

Prior.

The finer matter called *sand* is no other than very
small pebbles.

Woodward.

Grains of gold in *sandstone*, from the mine of
Costa Rica, which is not reckoned rich; but every
hundred weight yields about an ounce of gold.

Id.

O'er *sandy* wilds were yellow harvests spread.

Poyle.

The river pours along
Resistless, roaring dreadful down it comes;
Then o'er the *sanded* valley floating spreads.

Thomson.

SAND, in natural history, a genus of fossils, the characters of which are, that they are found in minute concretions; forming together a kind of powder, the genuine particles of which are all of a tendency to one determinate shape, and appear regular though more or less complete concretions; not to be dissolved or disunited by water, or formed into a coherent mass by means of it, but retaining their figure in it; transparent, vitrifiable by extreme heat, and not dissoluble in, nor effervescing with acids. Sands are subject to be variously blended, both with homogeneous and heterogeneous substances, &c., and hence, as well as from their various colors, are subdivided into, 1. White sands, whether pure or mixed with other arenaceous or heterogeneous particles; of all which there are several species, differing no less in the fineness of their particles than in the different degrees of color, from a bright and shining white, to a brownish, yellowish, greenish, &c., white. 2. The red and reddish sands, both pure and impure. 3. The yellow sands, whether pure or mixed, are also very numerous. 4. The brown sands distinguished in the same manner. 5. The black sands whereof there are only two species, viz. a fine shining grayish-black sand, and another of a fine shining reddish-black color. 6. The green kind of which there is only one known species, viz. a coarse variegated dusky green sand, common in Virginia. Sand is of great use in the glass manufacture; a white kind of sand being employed for making of the white glass, and a coarse greenish looking sand for the green glass. In agriculture it seems to be the office of sand to make unctuous earths fertile, and fit to support vegetables, &c. A vegetable planted only in sand, or in a fat glebe, or in earth, receives little growth or increase; but a mixture of both renders the mass fertile. Common sand is therefore a very good addition, by way of manure, to all sorts of clay lands: it warms them, and makes them more open and loose.

By the sand from the sea-shore many valuable pieces of land have been entirely lost; of which we

give the following instances from Mr. Pennant: 'I have more than once,' says he, 'on the east coasts of Scotland, observed the calamitous state of several extensive tracts, formerly in a most flourishing condition, at present covered with sands, unstable as those of the deserts of Arabia. The parish of Fyvie, in the county of Aberdeen, is now reduced to two farms. Not a vestige is to be seen of any buildings, unless a fragment of the church. The estate of Coubin, near Forres, is another melancholy instance. This tract was once worth £300 a-year, at this time overwhelmed with sand. This distress was brought on about 100 years ago, and was occasioned by the cutting down some trees, and pulling up the bent-star which grew on the sand hills; which at last gave rise to the act of 15 Geo. II. c. 33, to prohibit the destruction of this useful plant. The Dutch perhaps owe the existence of part at least of their country to the sowing of it on the mobile solum, their sand banks. Mr. Stillingfleet recommended the sowing of this plant on the sandy wilds of Norfolk, that its matted roots might prevent the deluges of sand which that country experiences. It has been already remarked that, wheresoever this plant grows, the salutary effects are soon observed to follow. A single plant will fix the sand, and gather it into a hillock; these hillocks, by the increase of vegetation, are formed into larger, till by degrees a barrier is often made against the encroachments of the sea; and might as often prove preventative of the calamity in question. The plant grows in most places near the sea, and is known to the highlanders by the name of *murah*; to the English by that of bent-star, matgrass, or mar-ram. Linnæus calls it *arundo arenaria*. The Dutch call it *helm*. This plant has stiff and sharp-pointed leaves, growing like a rush, a foot and a half long: the roots both creep and penetrate deeply into their sandy beds: the stalk bears an ear five or six inches long, not unlike rye; the seeds are small, brown, and roundish. By good fortune, as old Gerard observes, no cattle will eat or touch this vegetable, allotted for other purposes, subservient to the use of mankind.'

SAND BOX TREE. See **HURA**.

SANDA, or **SANDAY**, one of the Orkneys, twelve miles long, and from one to three broad. Its form is irregular, it is separated from Stronsay on the south by a channel three miles broad; from Eda, or Eday, on the west by a channel of one mile and a half broad; and from north Ronaldshay on the north by a channel of from one to two leagues and a half. The surface is flat, particularly on the east coast, which renders it subject to inundations during the spring tides, accompanied with an east wind. The soil is mixed with sand, but produces good crops, when well manured with sea-ware; which abounds on the coast, and is made into kelp in greater quantity than in any other island in Orkney.

SAN'DAL, *n. s.* Fr. *sandale*; Lat. *sandalium*. A loose shoe.

Thus sung the uncouth swain to the oaks and rills,
While still the morn went out with *sandals* grey.

Milton.

From his robe
Flows light ineffable : his harp, his quiver,
And Lycian bow are gold : with golden sandals
His feet are shod. Prior.

The sandals of celestial mold,
Fledged with ambrosial plumes, and rich with gold,
Surround her feet. Pope's *Odyssey*.

The SANDAL, in antiquity, was a rich kind of slipper worn on the feet by the Greeks and Romans, made of gold, silk, or other precious stuff; consisting of a sole, with a hollow at one extreme to embrace the ankle, but leaving the upper part of the foot bare. It was fastened on with leather strings, which crossed several times round the lower part of the leg. Besides these sandals, the ancients used also other coverings for the feet, which, like those of our own day, left no part bare. Those, indeed, often ascended as high as the ankle, and even the calf of the leg. The proper term given by the Romans to this latter article of dress was calceus. These were, however, generally regarded as troublesome and uneasy. The wearers took care to provide them of leather extremely supple, which was termed aluta, derivative of alumen, alum, that substance being employed to produce the requisite softness. The Roman matrons, when assembled on occasions of solemnity, wore the alutæ of white leather : the courtizans, on the other hand, preferred the sandal, of elegant shape and handsomely embroidered, this not hiding at all the shape of a pretty foot. For this reason, Ovid, in his *Art of Love*, counsels these amiable fair to conceal their feet, if ill formed, in an aluta of dazzling white.

SANDAL is also used for a shoe or slipper worn by the pope and other Romish prelates when they officiate. It is also the name of a sort of slipper worn by several congregations of reformed monks. This last consists of no more than a mere leathern sole, fastened with latches or buckles, all the rest of the foot being left bare. The capuchins wear sandals; the recolets, clogs; the former are of leather, and the latter of wood.

SANDARACH GUM is a dry and hard resin, usually met with in loose granules, of the size of a pea or a horse-bean, of a pale whitish yellow color, transparent, and of a resinous smell, brittle, very inflammable, of an acrid and aromatic taste, and diffusing a very pleasant smell when burning. Sandarach is esteemed good in diarrhœas and in hæmorrhages. The varnish-makers make a kind of varnish of it, by dissolving it in oil of turpentine or linseed, or in spirit of wine. That gum sandarach is only produced from a species of juniper was long a very common opinion; but it appears to be a mistake. The *juniperus communis*, from which many have derived this gum, does not grow in Africa; and sandarach seems to belong exclusively to that part of the world. The gum sandarach of our shops is brought from the southern provinces of Morocco. The tree which produces it is a *Thuia*, found also by M. Vahl in Tunis. It was made known several years ago by Dr. Shaw, who named it *Cypressus fructu quadrivalvi*, *Equiseti instar articulatis* : but neither of these learned men was acquainted with

the economical use of this tree; probably because, being not common in the northern part of Barbary, the inhabitants find little advantage in collecting the resin which exudes from it. M. Schousboe, who saw the species of *thuia* in question, says that it does not rise to more than twenty or thirty feet at most, and that the diameter of its trunk does not exceed ten or twelve inches. It distinguishes itself on the first view, from the two other species of the same genus cultivated in gardens, by having a very distinct trunk, and the figure of a real tree; whereas in the latter the branches rise from the root, which gives them the appearance rather of bushes. Its branches are also more articulated and brittle. Its flowers, which are not very apparent, show themselves in April; and the fruits, which are of a spherical form, ripen in September. When a branch of this tree is held to the light, it appears to be interspersed with a number of transparent vesicles which contain the resin. When these vesicles burst, in the summer months, a resinous juice exudes from the trunk and branches, as is the case in other coniferous trees. This resin is the sandarach, which is collected by the inhabitants of the country, and carried to the ports, from which it is transported to Europe. It is employed in making some kinds of sealing wax, and in different sorts of varnish.

SANDEC, one of the eighteen circles or districts of Austrian Galicia. It lies in the south-west of the province, on the borders of Hungary, and is watered by the Donajetz and the Poprad, the latter being the only river common to Galicia and Hungary. It is of irregular form, and contains 1400 square miles, with 195,000 inhabitants.

SANDEMAN (Robert), was born at Perth in 1723, and educated at the university of St. Andrew's. Becoming a member of the society of Independents, he in 1757 published a work entitled, *Letters on Theron and Aspasio*, 2 vols. 8vo., in which he attacked the Rev. James Hervey, author of *Theron and Aspasio*, in the most severe terms, and analysed all the most popular doctrines advanced in that work, with the most satirical criticism. Mr. Sandeman in 1766 went over to America, where a meeting was erected for him; but preaching the doctrine of 'submission to the powers that be,' this did not suit the spirit of resistance to British taxation which was then becoming daily more popular in the American colonies. He died in New England in 1772.

SANDEMANIANS, a sect of Independents, so named from the preceding writer. In Scotland they are called Glassites, from their founder Mr. John Glas, who was a minister of the established church in that kingdom; but, being charged with a design of subverting the national covenant, and sapping the foundation of all national establishments by the kirk judicatory, was expelled by the synod from the church of Scotland. His sentiments are fully plained in a tract published at that time, entitled *The Testimony of the King of Martyrs*, and preserved in the first volume of his works. In consequence of Mr. Glas's deposition, in 1728, his adherents formed themselves into churches, conformable in their institution and discipline to what they

apprehended to be the plan of the first churches recorded in the New Testament. And the peculiar doctrine maintained by them may be learned from the works of Mr. John Glas, and from Mr. Robert Sandeman's Letters to Mr. Hervey, in which he endeavours to show that his notion of faith is contradictory to the Scripture account of it, and could only serve to lead men, professedly holding the doctrines commonly called Calvinistic, to establish their own righteousness upon their frames, inward feelings, and various acts of faith. In these letters Mr. Sandeman attempts to prove that faith is neither more nor less than a simple assent to the divine testimony concerning Jesus Christ recorded in the New Testament; and he maintains that the word faith, or belief, is constantly used by the apostles to signify what is denoted by it in common discourse, viz. a persuasion of the truth of any proposition; and that there is no difference between believing any common testimony and believing the apostolic testimony, except that which results from the nature of the testimony itself. This led the way to a controversy among those who were called Calvinists, concerning the nature of justifying faith; and those who adopted Mr. Sandeman's notion of it, and who received the denomination of Sandemanians, formed themselves into church order, in strict fellowship with the Independent churches in Scotland, but holding no kind of communion with other churches. The chief points in which this sect differs from other Christians are their weekly administration of the Lord's Supper: their love-feasts, of which every member is not only allowed but required to partake, and which consist of their dining together at each other's houses, in the interval between the morning and afternoon service; their kiss of charity used on this occasion at the admission of a new member and at other times, when they deem it to be necessary or proper; their weekly collection before the Lord's Supper, for the support of the poor, and defraying other expenses; mutual exhortation; abstinence from blood and things strangled; washing each other's feet, the precept concerning which, as well as other precepts, they understand literally; community of goods, so far as that every one is to consider all that he has in his possession and power as liable to the calls of the poor and the church; and the unlawfulness of laying up treasures on earth, by setting them apart for any distant, future, and uncertain use. They allow of public and private diversions, so far as they are not connected with circumstances really sinful; but, apprehending a lot to be sacred, disapprove of playing at cards, dice, &c. They maintain a plurality of elders, pastors, or bishops, in each church; and the necessity of the presence of two elders in every act of discipline, and at the administration of the Lord's Supper. In the choice of these elders second marriages disqualify for the office; and they are ordained by prayer and fasting, imposition of hands, and giving the right hand of fellowship. In their discipline they are strict and severe; and think themselves obliged to separate from the communion and worship of all such religious societies as appear to them

not to profess the simple truth for their only ground of hope, and who do not walk in obedience to it.

SANDERLING, *n. s.* Of uncertain origin. A bird.

We reckon coots, *sanderlings*, pewets, and mews.
Curew.

SAN'DERS, *n. s.* Lat. *santalum*. A kind of Indian wood.

Aromatize it with *sanders*. *Wiseman's Surgery.*

SANDERS, or **SAUNDERS**, in botany. See **PTE-ROCARPUS**, **SANTALUM**, and **DYEING**.

SANDERS (Robert), a Scottish author, born near Breadalbane, in 1727. He went to London, and compiled, partly from his own survey and partly from books, a work entitled *The Complete English Traveller*, in folio. He next compiled *The Newgate Calendar*. He afterwards became amanuensis to lord Lyttleton; and Dr. Johnson mentions that he was in his lordship's employment when he wrote his *History of Henry II.* But of all his writings, that which made most noise was his *Gaffer Graybeard*, an illiberal work, in 4 vols. 12mo., in which the most eminent dissenting ministers of the age were treated with very little ceremony. He died in 1783.

SANDERSON (Robert), F.R.S., a learned and laborious antiquary, who was usher of the court of chancery, and clerk of the chapel of the rolls. He assisted Mr. Ryder in publishing his valuable work entitled *Fœdera*; and continued it after his death; beginning with the sixteenth volume, the title of which says, *Ex schedis Thomæ Rymer, potissimum edidit Robertus Sanderson*, 1715; and ending with the twentieth, August 21st, 1735. He died December 25th, 1741.

SANDEVER, *n. s.* Fr. *saindever*. Defined below.

That which our English classmen call *saindever*, and the French, of whom probably the name was borrowed, *saindever*, is that recrement that is made when the materials of glass, namely, sand, and a fixt lixiviate alkali, having been first baked together, and kept long in fusion, the mixture casts up the superfluous salt, which the workmen afterwards take off with ladles, and lay by as little worth. *Boyle.*

SANDING ISLES, Pulo Sanding, or Sandiang, two small islands off the south-west coast of Sumatra, near the south-eastern extremity of the Nassau or Pogygy Isles, in which group they are sometimes included. They are inhabited, and only remarkable for the production of the long nutmeg, which grows wild; and some good timber, particularly of the kind known by the name of marhaw. An officer and a few men were landed here in 1769, with a view to the establishment of a settlement, but the scheme was subsequently abandoned.

SANDIVER, a whitish salt, continually cast up from the metal, as it is called, whereof glass is made; and, swimming on its surface, is skimmed off. Sandiver is also plentifully thrown out in the eruptions of volcanoes; some is of a fine white, and others tinged bluish or yellowish.

SANDIUS (Christopher), a celebrated Socinian writer, born at Königsberg, in Prussia, in 1464. He wrote *Nucleus Historiæ Ecclesiasticæ*, and various other works in favor of his opinions, and died at Amsterdam, in 1680.

SANDOMIR, a palatinate or province of the new kingdom of Poland. It is bounded on one part by the Vistula, on another by the Pilica; the rest of the boundary is formed by the palatinate of Cracow. Its area is about 4700 square miles, with 448,000 inhabitants. It abounds in wood, and has several sandy tracks and marshes, but in general is of great fertility, and wants only a skilful and efficient cultivation to render it flourishing. This palatinate has a greater variety of minerals than is common in Poland. Sandomir was also the name of a palatinate in the old kingdom of Poland. It was of considerable extent, but in 1772 the part to the right of the Vistula was ceded to Austria.

SANDOMIR, a town in the south of Poland, on the Vistula, opposite to the influx of the San, and the chief place of the foregoing palatinate. In a remote age this was the residence of the court. At present it is a poor place, and the houses built of wood.

SANDORICUM, in botany, a genus of the monogynia order, and decandria class of plants; natural order twenty-third, trihillatæ: CAL. quinque-dentate; petals five, and linear shaped; nectarium having ten dentes, on which the antheræ grow; the fruit is a drupa, and five in number, each of which has one seed. There is only one species, viz.

S. Indicum, a native of Africa and the East Indies.

SANDRAT (Joachim), a celebrated German painter and author, born at Frankfort, in 1606. He was early sent to a grammar school, but, showing an inclination for engraving, he was allowed to follow his own wishes. He went on foot to Prague, and placed himself with Giles Sadler, a celebrated engraver, who advised him to study painting. He accordingly went to Utrecht, and studied under Gerard Honthorst, who took him to England, where he staid till 1627. He then went to Venice, where he copied the paintings of Titian and Paul Veronese; and thence went to Rome, where he became eminent. He then went to Naples, and thence to Sicily and Malta, and through Lombardy to Frankfort, where he married. The manor of Stokau having fallen to him, he repaired it at a great expense, but had hardly got it finished, when it was burnt by the French. Upon their retreat, he rebuilt it in a better style than ever; but, on the rumor of a second invasion, sold it, and settled in Augsburg; which, on his wife's death, he left, and went to Nuremberg, where he set up an academy of painting. Here he also published several volumes on subjects relating to his profession; the most esteemed of which is, *The Lives of the Painters, with their Effigies*; being an abridgment of the biographical works of Vasari, Ridolfi, and Van Mander. He painted till he was seventy years of age, and died in 1683, aged seventy-seven.

SANDROCOTTUS, an Indian of mean birth, contemporary with Alexander the Great, who, from the prodigy of a lion once licking the sweat from his brow as he was sleeping, prognosticated future greatness to himself. For impertinence to Alexander, he had been ordered out of his presence, but, on the death of that conqueror,

he actually made himself master of a part of the country in the hands of Seleucus.

SANDSTONE, in mineralogy. See MINERALOGY.

SANDWICH, a borough, cinque port, and market-town in Eastry hundred, Kent, sixty-eight miles east by south of London. It contains three parish churches, and was, previous to the blocking up of its harbour by the sand, a place of considerable importance. It was walled and surrounded by a ditch, and was considered in ancient times a place of great strength. The town is irregularly built, standing on the bank of the river Stowe; the streets are narrow and incommodious; the principal manufactures are those of ropemaking and shipbuilding. The exports of Sandwich are grain, flour, seeds, hops, wool, malt, and leather. The town is governed by a mayor, recorder, twelve jurats, and twenty-four common councilmen, and, being the principal cinque-port, the mayor carries a black knotted staff, whilst the other cinque-ports are only allowed white ones. The members belonging to Sandwich are Fordwich, Deal, Ramsgate, Reculver, Sarre, Stoner, and Walmer. It sends two members to parliament, who are returned by the corporation and freemen, and it also gives the title of earl to the family of Montagu. There is an hospital for six poor men and as many women, and another for twelve men, dedicated to St. Thomas; also two good charity-schools. In the town-hall is the council chamber and court-hall, in which half-yearly sessions are held. Market on Saturday.

SANDWICH, an island of the Eastern seas, opposite New Ireland. It is rather low, and covered with trees. Long. of the most westerly point, $50^{\circ} 54' 15''$ E., lat. $2^{\circ} 59' 26''$ S.

SANDWICH ISLANDS, an interesting group of islands, consisting of eleven islands, discovered by captain James Cook in the beginning of the year 1778, lying between the parallels of $18^{\circ} 54'$ and $22^{\circ} 15'$ N., and extending in longitude from the meridian of $154^{\circ} 54'$ to $160^{\circ} 24'$ W. They are called by the natives Owhyee (Hawaii), Mowee (Maui), Ranai (Lanai), Morotinnee (Molokina), Kahowrowee (Kahaurai), Morotoi (Molokai), Woahoo (Oahu), Atooi (Kauai), Oneehou (Niihau), Oreehoua (Lihaua or Lihaua), Tahoorra (Kahura).

Hawaii, the easternmost, and by far the largest of these islands, is of a triangular shape, and nearly equilateral. The angular points make the north-east and southern extremities. Its greatest length, which lies in a direction nearly north and south, is eighty-four miles and a half; its breadth seventy-two miles; and it is about 293 miles in circumference. Of the six large districts into which this island is divided, Ehidu is the most healthful and fertile. The chiefs at Oahu generally speak of its exuberance and beauty with the liveliest expressions of recollected pleasure, since Hawaii is the birth-place and cradle of sovereignty. A great part of the coast presents only a few trees growing out of the mouldering remains of volcanic eruptions, and shapeless slags of lava; but, after ascending a few hundred feet, the traveller finds himself shrouded in a cloud, and amid the soft verdure

of a most luxuriant vegetation. The black cattle, which were introduced by the circumnavigator, have multiplied exceedingly; and there is reason to believe, from the accounts given by the natives who have penetrated into the central parts of the country, that its recesses contain a store of vegetables to reward the pains, and inform the understanding, of the laborious and enlightened botanist. Mauna Roa, or the great mountain, is estimated to be nearly 16,000 feet high; a volcanic mountain, once the source of superstitious fears and the engine of priestly bondage, as it is now the wonder of all who visit Hawaii, and the wished-for bower of their toil and travail.

Maui lies at the distance of twenty-four miles N. N. E. from Hawaii, and is 140 geographical miles in circumference. A low isthmus divides it into two circular peninsulas, of which that to the east is called Oamaduia, and is double the size of the eastern peninsula called Wailukee. Its mountains are so high that, by an optical illusion, their summits appear like hills resting upon the clouds. Lihaua, the residence of the princess Nahienaua, and of her missionary tutors, presents a very beautiful landscape when viewed from the sea, but disappoints the spectator as he approaches the landing place, for want of a green carpet to conceal the disagreeableness of a dirty red soil. Captain King remarks that 'this pleasant scene was shortly changed on advancing a few miles to the westward. The face of the country became totally different, the shores and sides of the hills had no indications of being inhabited, and were almost destitute of vegetable productions.' 'There appeared to be a rude mass of naked, barren rocks, broken into deep gulleys, that extended from the mountains to the sea-side.'—Vancouver.

Lanai is about nine miles distant from Maui, and lies to the south-west of the passage between these islands. The country, to the south, is high and craggy, but the other parts of the islands present a better prospect.

Oahu lies to the north-west of Molokai, at the distance of about seven leagues, and is computed to be about forty miles long, and somewhat less than eight in width. The highest mountain is conjectured to be about 4000 feet in height, and was first ascended by the writer of this paper in company with several natives and two of the mission family. The natives mocked their dread of a monstrous mou or lizard, which superstitious awe had created and endowed with supernatural attributes, by charging themselves with the load of warlike weapons; and after mou's ascent invoked his fancied godship in tones of defiance. The deep recesses of the mountains are rich in the varied produce of stately trees and other vegetable curiosities. A wide extended plain, called the wilderness of Weuroa, runs obliquely across the island, and is at least 300 feet above the level of the sea. Its fertility might, by industrious means, be turned to a good account. Between Kahaurai and Maui lies the small uninhabited island of Molokina.

Molokai is only seven miles and a half from Maui, to the north-west; very barren, and nearly without wood.

Kauai lies to the north-west of Oahu, and is

distant from it about eighty-one miles. The face of the country to the north-east and north-west is broken and rugged, but to the south it is more even; the hills rise in a gentle slope from the sea side, and at some distance back are covered with wood.

Niihau lies fifteen miles to the westward of Taui. The eastern coast is high, and rises abruptly from the sea; but the rest of the island consists of low ground, excepting a cliff on the south-east point. This island produces the best kind of yams that are to be obtained among the islands, and the *dracaena terminalis*, or tea-root (kii), which yields, by boiling, a luscious juice resembling molasses.

Lihaua, separated from Niihau by a channel about a mile in breadth, is of very small extent, and entirely composed of one barren rock, to all appearance destitute of soil, and presenting no indication of ever having been by choice the residence of human creatures.

Kahura is a low sandy island, and visited only for the purpose of catching turtle and sea-fowls.

The island of Hawaii was on the 25th of February, 1794, ceded to Great Britain by Tamaahamaah, or, according to the present orthography, Kamehameha, the king of Hawaii, who by right of conquest became afterwards supreme governor of all the islands, and hence it is evident that all the Sandwich Islands are, both by discovery and cession, the property of Great Britain. This is now the more to be insisted upon, because the American government, presuming that the islands were autocratical, empowered captain Jones of the Peacock to negotiate a treaty of neutrality with the natives, in which it was, among other things, stipulated that, in the case of a war between Great Britain and America, any ship should be indemnified by taking shelter in any of the ports of the Hawaiian Islands. This treaty was in a very clandestine manner brought about through the ministry of some of the American missionaries, who in this instance seem to have forgotten the nature of their high calling, and humbled themselves to become the instruments of a secular, and not very honest, policy. A desire to blot out the remembrance of the generosity of Great Britain, by razing the memorials of her good deeds done to the islanders, gave occasion, as the writer has reason to believe, to the following otherwise unaccountable transaction, of which he was an eyewitness:—Returning one evening from the consul's house to his rooms at Whitehall, the former residence of the late prime minister Karaimoku (shortly after the orders of the late king and queen of these islands had arrived), he was surprised to see all the principal chiefs of the neighbouring islands assembled round the door of the sepulchre which had been reared for the reception of the coffins; and yet more astonished on entering to behold one of the coffins just about to be lowered down into a grave prepared for that purpose. His presence was immediately announced by murmurs of the foreigner (*ta hauré*), and they listened with submission to his admonition, that charged them with an unaccountable piece of ungrateful conduct in removing these great pledges of king George's love, which, in the sen-

timents of these islanders, are always accounted sacred. After some consultation the queen, calling me aside, requested that I would go and ask the concurrence of Karaimoku, the dying minister, who, in the laconic style of authority, said, 'It is enough.' The design was immediately dropped, and the dead suffered to sleep in peace.

The face of things since the time of Cook has been completely changed, the cloak of vermilion-tintured feathers once worn by the chieftains has been exchanged for a guise of European fashion, and the plummy sceptre, or kahele, which was wont to precede persons of distinction, is now displaced by some foreign badge of rank and office. Instead of the thrilling sound produced by the combination of various rhythmical instruments, played in measured cadence to the movements of a dance which was led in honor of some tutelary divinity, you hear the curious recitative of numerous scholars chanting their lessons, as they are taught to combine the flowing sounds of their native language into words and sentences. Nor has the outward garb alone undergone a great change since that period, if we may judge of the present generation by comparing them with a few old men who are the survivors of the last; for there has been a great falling off in mental activity and manly fortitude. An observer discovers a certain nobility of disposition indicated by the carriage of the elder race, and a certain frankness of humor, of which he cannot discern the slightest symptoms in their drowsy-headed offspring who crowd the courts and dwellings of the chiefs. In the room of engaging in those sports and gymnastic exercises which were once the favorite amusements of his forefathers, a native, when he has finished the task which necessity imposes on him, betakes himself to his mat, and solaces his cares by reciting a psalm or portion of sacred scripture, which the industrious missionary has clothed in the mother dialect of his willing convert.

An islander looks forward to the time of a special assembly and examination of the schools as to a day of general festivity, while all his thoughts are taken up in providing the best apparel for the occasion, and in repeating his lessons that he may merit the public applause of the chiefs and missionaries. The extraordinary fondness which these people exhibit for reading seems to be a phenomenon in the human mind; since, from the scantiness of translated matter, the same lesson is necessarily repeated many thousand times during the days of preparation preceding these general meetings: and the intellectual gratifications required must therefore, on every view of the subject, be but 'a vanishing quantity.' The allotted hours of labor, the proportional mean between the longest and shortest spaces of daylight, are not thought sufficient for the praxis of their palapala or reading, but in these seasons they borrow freely of the night, so that, when fever and pain have kept the writer waking, he has often heard, during the silent watches of midnight, the disjointed sounds of murmuring voices. This may however be explained by having recourse to the superior principle, that occupation is as necessary to the health of the mind, as the stimulus of the non-

naturals is to that of the body, and hence we see one reason why a preference is given to an exercise that demands so few of our physical energies.

The government is at present monarchical, and was at a late period administered by Kahamanu, the favorite queen dowager of Tamelameha, at whose nod all the chiefs and subordinate governors tremble. 'All the land is said to be held in fee by the king or queen regent, who can take away or bestow it at their pleasure. The aristocratic part of the community let their lands by a kind of feudal tenure, which obliges the tenant to render allegiance to his landlord, and, in time of battle, to repair to his standard; who, besides receiving the customary rentage of half the produce, seldom scruples to take the fattest of his swine, and the choicest part of his crop. To remove this great discouragement to industry, some laws to secure the enjoyment of property are highly necessary. To aggravate their miseries, a law was passed some years ago obliging every man to dispose of this abundance to foreign ships, &c., by bringing it to the public market, where, besides paying the clerk, he was compelled to surrender half the price to the king; but this severe imposition was at the recommendation of the English consul taken off; and, by the abolition of interdictions and various species of tyranny, they begin to realize some of the advantages of freedom. We have often admired the silence and promptitude with which the orders of the queen were executed; the minister who has any particular part of her property in charge, or whose business it is to fill any office of government, seldom requires more than the silent expression of the countenance to interpret the will of his mistress.

They all acknowledge the supremacy of the English government, and are impatiently waiting for its interposition and advice in framing a few laws or maxims for adjusting their disordered state of affairs. Though there are differences of opinion as to what rules they ought to be governed by, and some complaints of the great austerity of the missionary discipline, yet there is not the slightest symptom of disturbance. The common people have sold and forgotten the use of their native arms; and the ambition of ruling over others is displaced by the desire of appearing more learned, more religious, and better habited, than their fellow creatures.

In order to train and bring under subjection the humors of the younger people, an absolute authority over them seems necessary. For where diet, lodging, and climate tend to foster the concupiscible part of our nature, and the restraints of legal enactments, custom and example are scarcely felt; the cordial draught, mingled by Circe for the unwary, becomes far more tasteful, and its draught attended with less remorse than in societies where legislation and the judgment of civil courts provide pains and penalties for transgressors. If we regard individual depravity, the Sandwich islander will appear to advantage over many civilised nations; but, to institute a just comparison, we must consider him in a state of society wherein he will come very short of an equality with most, there being

little of what Tully calls *communitas*, in which condition each individual member contributes his quota of benefits, that he may be a joint partaker in the common stock of happiness.

The counterpart of the sirens, fabled in ancient story, who have been deemed by some to exist only in the imagination of poets, may be found at Oahu, who win not by a voice tuned to enchant by melodious warbling, but by the far more powerful spell of female suasion, that—

*Ὅστις αἰρήνῃ πελασσι καὶ φθογγῇ ἀκούσι
Σειρήνων τῷ ἔοντι κνήῃ, καὶ νήπιι τέκνῃ
Ὅϊαδὲ ροστήσαντι παριστάται, ὄνέ' εἰ γυννται.*

He who was so void of understanding as to listen to the pleasing sorcery of their enticements never after felt any longings after the blandishments of home, nor the fond caresses of his wife and children. And it is no uncommon thing to witness a youth of respectable parentage and hopeful parts, allured, on his first visit to Oahu, into the vortex of sensual delights, and, after reeling a few years in dizzy dissipation, snatched away by a fit of apoplexy, unless he be removed from inevitable ruin by some forceful interposition. One would not be inclined to predict that a gentleman, who had been fostered in the bosom of society, could prefer a life at Oahu, where there are none of those things which we significantly call comforts, to his maternal hearth, where they come unbought and unasked for. But we have seen instances in which all the advantages and all the charities of life were exchanged for a pleasing companion and the delicious liberty of Honolulu. We have adverted to this effect upon the minds of foreigners by way of extenuating, if it can be admitted as an extenuation, the licentious habits of a great proportion of the natives, and to give the reader some perception of the baits which pleasure holds out in a place wherein a stranger, at the first glance, would not expect to find such a profusion of her dainties.

Few encomiums can be justly bestowed upon the moral rectitude and integrity of their minds, but in spite of degeneracy there have been many, and still are a few remaining, who in this respect might be patterns for people of a better education. The frequent examples of falsehood and covenant-breaking arise not altogether from a malignity of nature, but in some measure from the want of a customary or intuitive discrimination of right and wrong, and of consequence the selfish passions, receiving little or no check from enlightened reason, are allowed to gain the ascendant; and hence, unless profit be in the prospective, a benefit seldom finds a counterpart in the mutual good offices of friendly intercourse. To make a native a present in order to entice him to engage in any work of utility would be the most effectual way to baffle the hopes of performance; and we have been taught by experience the necessity of deliberating when about to recompense a servant for his services, whether we could dispense with his attendance for several days; for no sooner was he in possession of the reward than he presently disappeared to enjoy it. There is radically in their disposition a certain waywardness and inclination to play the truant, the growth of a long-enjoyed free-

dom from established rules of action, which, in order to render them capable of discharging those duties which devolve upon us from the relations of civil and social life, must be cured; and this cannot be done by any foreigner, whether priest or layman, without the coercive authority of some superior chief exerting itself in pursuing the runaways to their hiding places, and bringing them back to their fancied hard bondage. All the experiments we have seen tried or heard related frustrated the exertions of their foster parents, except on one who was a girl, confided to the care of a respectable missionary by a chief woman of Hawaii, who, as often as the maiden eloped from confinement despatched her people in all directions to find out the place of her concealment. The damsel did not, as might have been expected, retain any resentment, but required their pains by waiting on her sick master and mistress unaided, with the most diligent and loving attention. In the summer of 1827, when we visited the family, the little maid was still living with them, and appeared an emblem of good nature and assiduity. We notice this fact, because, while it illustrates their native disposition, it encourages the philanthropist to hope that if the same discipline, grievous indeed for a time to the child, could be made use of, many who, without education would be given up to lasciviousness, might by timely interposition be retrieved and made to fulfil with applause those duties which heaven has ordained for our general benefit.

There is one thing, independent of a genial climate, which tends to encourage the promiscuous intercourse of the sexes, namely, on particular occasions the herding together of many hundreds of both sexes within the confines of one apartment or dwelling-house, who, during the time of repose, when they are extended or rather strewn upon the matting, adjust themselves so as mutually to serve as pillows for each other, and by their numerous intersections form such a species of network as a traveller is seldom indulged with a sight of. Besides there is a certain roving propensity among the better sort, especially derived from an old custom of sojourning but a short season in any province or island, and this practice was, anterior to the port town of Honolulu becoming the emporium of the whole group of islands, so prevalent, that these successive pilgrimages answered the purpose of a sort of memorial notation for measuring the time elapsed since the happening of any important event. But since it is not practicable to come at all the foreign commodities in so expeditious a manner as at Honolulu, the chiefs who reside there content themselves by indulging this hereditary propensity to peregrinations on a smaller scale, and with removing to houses newly erected by themselves or their friends and equals, and hence the privileges of the host or hostess being in no respect different from those of the guests, a stranger, on his first visit, finds it difficult to distinguish the occasional inmates from the original proprietor of the tenement. We have been told that Tanahameha, who subjugated all the islands to the yoke of Hawaii, being aware of this disposition of his subjects, when he had built a

house, levied the toll of a crown upon every chief and commoner who came to visit him in his new residence; but such is the excess of this peculiar species of curiosity and fondness for novelty, that I never heard but that this exaction was cheerfully paid, though money was not at that time very plentiful among them. In their intellectual character they sometimes evince a degree of shrewdness for which an observer, from a contemplation of some parts of their mental exertion, would not antecedently be inclined to give them credit; to mention an instance or two which fell under my own notice:—While a numerous circle of natives, whom, at the writer's departure, he for the first time admitted into his room, were offering various articles of native art for sale to one of his brother officers, he remarked to him that a fisherman was exhorting one with whom he was in treaty not to lower his demands; but the former, guessing the nature of our communication, very gravely told the writer that as his conversation was addressed to another he had no business to apply or hear any part of it. A person who was steward of all the sandal-wood exported from Oahu was accused of embezzling his master's property; the chief, after reflecting a few minutes, said, in reply, 'I know that this man robs me, but he will not allow another to do so; now I know, if I trust you, that you will not only rob me yourself, but suffer others to do it.' Nothing can be more complete than the dominion which the Christians have obtained over their minds, nor any thing surpass the eagerness which they evince to be better acquainted with the statutes and ordinances of Holy Writ.

The American missionaries, who have been chiefly instrumental in changing the features of these islands, are, in the relative sense of language, men of unblemished moral character, notwithstanding the strange load of calumnies and obloquy which has been cast upon them by their adversaries; for none of the many grievous charges which they had brought against the missionaries could be made good when they were convened in a public manner for the specific purpose of finding them guilty; and so little foundation had their railings in truth and verity that they speedily dropped the cause, and were fain to change sides with the defendants. The capital offence which the missionaries have given to the residents and visitors is by instigating the chiefs to prevent the intercourse of the unmarried women with foreign suitors, by prohibiting their going on board the vessels. The moral character of the missionary is not to be impeached because an enlightened judgment does not always lead him to frame the best schemes and adopt the most eligible methods for gaining his purpose. Men of no great learning, and less acquaintance with secular matters, often endeavour to make the general rule efficient without taking into the account those corrections which the various modifications to which it is subjected when put in practice might seem to require. The logic of the missionary teaches him to argue thus:—'Hath not the Scripture said it, and shall men presume to add to or take from that book?' No: but a divine command-

ment sometimes resolves itself into one or a more general influence; as, for example, that of keeping the sabbath holy does into that precept to show mercy and kindness to all God's creatures. To cut off occasion for cavilling we will divest their reports of that machinery which has dignified the progressive issue of the labors, and briefly sum up the effect of their exertions, which we think every wise man will allow to be highly beneficial. They have taught the idolaters, as far as the instruments of communication assist them, the unity of the God-head, and the infinite perfection of the divine attributes, the scope and design of revelation, and the obligation of moral virtues. They have fixed the varying sounds of language in a permanent orthography, and have instructed the majority of the natives in the nature and use of these symbols, so that they can read what is written and communicate with their friends by means of letters; and, lastly, they have prevented an unspeakable deal of hard usage by reviving the primeval law which ordained that man was not only the head, but the protector of his helpmate.

There is one *phenomenon*, though familiar to all, which a traveller in ascending the mountains, if he possesses any relish for the sublime and beautiful, cannot fail to admire; this is the appearance of rainbows in arcs of various curvatures, hung as it were in the ample void of the deep valleys below him: sometimes a thread or two only of the complex twine of light curving to the sun's altitude, are spread on the bosom of a hill; at others the purpled scarf of iris, like an oblique zone, partly encircles one of the lesser mountains, and thence it comes to pass that this strange imagery, added to other entertainments of nature, beguile the mind from regarding the concerns of the body, which is toiling through black mud and drenching rains to climb the headlong ascent of some lofty eminence. In the year 1827, August 18th, when crossing the wilderness of Wairoa, we witnessed a rainbow which seemed best fitted to make the way-faring man turn aside and wonder at the bright enchantment; the primary bow appeared like a solid arch, with its two ends resting on the plain a few paces from us, and was strengthened by three supernumerary red arches of unusual splendor; the secondary bow was not complete, but had one supernumerary arch. This glorious apparition appeared to a lively imagination calculated to afford a glimpse at a similitude of those transcendent spectacles described by St. John and the prophet Ezekiel.

The frequent showers which fall in the higher parts of this island are to be ascribed to the trade wind, which brings along with it a mass of vapors. These being impelled by the current of air are, in order to surmount the obstruction of the interposing ridges, obliged to ascend into a region of less relative heat and density, where the atmosphere, being unable to hold the vapory particles any longer in solution, sheds them upon the brows of the highest mountains.

Diet.—The vegetable called *poe* may be justly said to be the staff of life, and to answer the purpose of bread among us. This is made by first roasting and then macerating

the roots of the taro till they can be reduced by kneading and the gradual admixture of water to a pulpy solution, which, after it has remained in calabashes a few hours to acquire of fermentation a slight degree of acidity either with or without a little animal food, forms the stay of a Sandwich islander's diet. The nauseous custom of eating dogs is very much tempered in the imagination by observing in what manner the animal is nurtured, that it never goes abroad without being carried, and that it eats of the same morsel and drinks out of the same cup as its mistress. The flesh is thus rendered more wholesome and palatable than that of the swine, whose feeding is not half so delicate. Modern cookery has not devised a method more simple or more effectual for dressing meat, without hardening the muscular fibre or dissipating the savory juices, than the custom used from time immemorial of wrapping up the flesh in the succulent leaves of the taro, and submitting it to the action of heated stones in an oven hollowed out of the ground. This viand, when served up with the vegetable sauces, is called luau.

We may specify the following as the principal productions of these islands:—1. Ohia, *metrosideros*, a species in which this country is comparatively rich, are distinguished by some adjunctive epithet importing their respective uses or properties. 2. Ohia-ai, or edible ohia, which, instead of the capsules borne by the rest of the genus, yields a pear-shaped fruit of a very mild and juicy nature. This is a tree of peculiar beauty and stateliness, and the large dark green leaves are strikingly set off by the bunches of red flowers which are followed by clusters of fruit garnishing the lower part of the branches in rosy profusion. 3. Pilo, a species of *capparis*, bearing a large white flower singly from the bosoms of alternate, smooth, elliptical leaves, and an oblong yellow berry. 4. Limii, a general name for the submarine productions of that part of cryptogamous botany called algae, but particularly of the various species of *fucus* which are made into saline pickles, and are very much relished by them; a peculiar sort called *kala* is the most esteemed. Every species has its appropriate name. 5. Kukui, *aleurites trilobata*, or candle-nut tree. The hoary foliage of this tree diversifies the hills with the appearance of white patches. The nuts, when divested of their integuments, were formerly set in order upon a sharp stick, and burnt in the room of candles. They also yield by expression an oil that has the practical uses of linseed oil. 6. Ko, *corelia sebestena*, a large shady tree which grows by the sea side. This genus is chiefly characterised by having a divided style, which, with its globular stigmata, resembles the figure of that kind of ancient scourge called scorpions. 7. Ko, *saccharum*, the sugar-cane, which grows wild on the banks of rivulets, has, by cultivation, been modified into at least twenty varieties, distinguished from one another by the color of the stem, sheath, and midrib of the leaf, and the variations of its surface. Were industry as kind to this people as nature is in the production of this plant, the making of sugar might be made a manufacture of great importance to them.

8. Ka, a species of *cyperus*, the root of which affords a gluey substance, used in glazing and scenting their native cloth. The odor is of such a narcotic nature that, if a piece of cloth treated in this way be allowed to remain in a close room, it is apt to affect the person who inhabits it with an intolerable sickness, which continues till the offensive material is removed. 9. Hapu, *cibotium chamoisai*, the ark-formed, distinguished from the *Dicksonia* by the determinate figure and cartilaginous nature of its capsules, which are a stem of that genus seated upon the margin of the frond. From a stock of about a foot high usually issue several doubly winged fronds; this is crowned with convolute bundles of brownish silk, which was formerly made into pillows and cushions. The hapu is sometimes roasted and eaten; but, from the admixture of woody matter, is not very nutritious, nor very easy of digestion. 10. Ie, climbing pandanus, the leaves at the top of the branch expand and form a cup-like receptacle for the fruit, which, by the absorption of oxygen, change to an acetous pulp. This, as well as the ripening berries, with which branched spikes are closely studded, is greedily devoured by the little birds. The stem is about an inch in diameter, sending forth many radicles, which attach themselves to, and imbibe, the juices of the larger trees, particularly the *mimosa*, *heterophylla*, or *hoa*. The tree, being robbed of its nutriment, after a few years begins to show signs of decay, becomes stag-headed, and ultimately dies. 11. Thoa, *minosa heterophylla*, remarkable for the transformation of its leaves. This alienation is accounted for by supposing that the plastic substance provided by nature for the leaf is appropriated by the leaf-stalk; for, in the younger trees, it may be traced from an incipient winged expansion, till it ends in a single uniform leaf, at which time, the power of further vegetation being exhausted, the numerous leaflets, following an inverse ratio in number and size; disappear. The wood of this tree is very useful in the construction of canoes. 12. Thi, the *oxalis* and *marsilea quadrifoliata*, which latter genus is characterised by having a receptacle rising from the root, and forming a box, which contains many rows of capsules, separated by the doublings of a subtle membrane. The roots of this water plant, by their mode of propagation, weave a kind of net-work, which we have seen the chief women convert into a scarf, and wear about their necks and shoulders. 13. Oranā, a shrub belonging to the family of the *urticæ*, belonging to the genus *morens*, furnishes, from the woody fibres of the bark, a fine material for the making of cordage. 14. Ahulu, *tephrosia pircatoria*, the bark used for poisoning fish. 15. Vthi, a species of grasshopper roasted and eaten. 16. Iriahi, *somtolium* or *sanders wood*, an important article of commerce with China, but, like other sources of national wealth which are not the gradual result of honest industry, has, by inducing an over-confident hope in the adequacy of their means, brought upon the unwary people a huge mass of debts, of which, unless they continue to pursue the plan proposed by his Britannic majesty's consul, in erection of a poll toll they will not speedily disencumber themselves.

Pastimes.—It has been already hinted that scarcely any remnant of their elder games and exercises are now left to give the traveller some notion of past times, and hence, if a rare accident does not favor him, he must learn their nature from the relations of the old people. Pohinehine is a game of chance, wherein several folded pieces of native cloth are severally placed before each player; a man then dexterously passes his hand under every one of them, containing a stone, which is hidden beneath a different parcel each time, while each competitor in his turn strikes with a wand, at a venture, any one of them. After ten rounds, the game is decided in favor of him who has struck the lucky parcel of cloth the greatest number of times. Wawainle is a species of dichotomous, or club-mess, lycopodium. Akakamoa, the denomination of a game formerly played by two chiefs, with the dichotomies of the branches mutually hooked within each other; the gamester whose fork, in pulling them asunder, first broke, lost his wager. Moko-moko, or boxing-matches, consecrated to the memory of Olono, a certain deity who was believed to have vouchsafed his presence under the form of captain Cook. The people of two neighbouring districts used to assemble on their borders when these games were about to be celebrated. A ring being formed, an athlete would, like Dares Æneid, v. 376, bare his broad shoulders, and, with uplifted arms alternately, provoke the yielding air a few moments, and then retire; one from the opposite side would follow his example; and this exhibition, by turns of the candidates for renown, continued till the eyes of some well-matched pair had singled out each other. A fall, or turning the back upon the antagonist, decided the combat.

Language.—One general language is extended over all the islands, which are comprehended under the name of Polynesia, subject to a peculiar dialectical variation in each particular group, with occasional mixture of words which, from their anomalous form, seem to have been borrowed from different sources. In the first primer that was printed by the missionaries their dialect is made to embrace seventeen elementary sounds; but, since the natives confound in their articulation the elements D T K, R L, B P, with each other, it appeared expedient to a council of missionaries, in order to prevent an embarrassing variation in the orthography of the natives, to retrench the superfluous letters, and reduce the number of simple sounds to twelve. But since the U, like W, sometimes assumes the power of a consonant, there seems to be no reason why it ought to be retained.

The orthography is precisely the same as that adopted from the Sanscrit by professor Lee in the compilation of the New Zealand grammar. The dialects of Hawaii and New Zealand differ chiefly in the presence of nasal sounds in the latter. A short acquaintance with their analogies shows how near such words as New Zealand, Tangata, and Tanata, as the word Kanaka is often heard. The vocal organs of a Sandwich islander, without long training, find it impossible to articulate the harsh combinations of consonantal sounds of our language; but his ear can nicely discrimi-

nate the appropriate sound of each vowel and diphthong. They never amalgamate two consonants, a mute and a liquid, as we do in the syllable bri in Britain, but usually insert a sheva, or short vowel sound, to soften the utterance, and pronounce that word as if it were written Perikaue. The affinity of the Polynesian language with the Malayan has been pointed out by Mr. Marshman in his grammar of that tongue, and its etymological relationship to the Hebrew did not escape the notice of the propagators of the gospel; and, during the author's stay at Oahu, he observed several instances in words and phraseology. To give our readers some notion of the softness and flowing sweetness of this dialect, we will select a distich from a hymn composed by the missionaries, in which the Indians call upon their hearts to rejoice that the love of God has visited them. It is read nearly as if it were Italian:—

Ua iki mai nei ke kanawai mau
Ke hauoli nei ko kakou naau.

SANDWICH LAND, a name given by Cook to the southerly land which he discovered in the South Atlantic Ocean, otherwise called Southern Thule.

SANDY DESERT, a name given by way of eminence to an extensive tract of Hindostan, in the province of Gujerat, where the army of the celebrated Mahmoud of Ghizne was nearly lost. After the taking of the temple of Diu, in the year 1025, one of the priests offered himself as a guide to the sultan; and, having purposely led them into the heart of this desert, boasted of his success, on which he was instantly put to death.

SANDY HOOK, an island of the United States, on the coast of New Jersey, in the township of Middleton, seven miles south of Long Island, and twenty-five south of New York. It was formerly a peninsula. Sandy Hook, or Point, forms a capacious harbour, where is a light-house on the north point of the Hook, in long. 72° 2' W., lat. 40° 26' N.

SANDY LAKE, a lake of North America, near the source of the Mississippi, twenty-five miles in circumference. Of the numerous rivers running into it, one is entitled to particular attention, viz. the Savannah, which, by a portage of three miles and three quarters, communicates with the river St. Louis, which flows into the Lake Superior, at the Ford de Lac, and is the channel by which the North-west company bring all their goods for the trade of the Upper Mississippi. The rigor of the climate is extreme here. Lat. 46° 9' 20" N.

SANDY LAKE RIVER, a large but short river of the United States, which falls into the Mississippi. It connects the lake of the same name with the Mississippi, by a strait only six miles in length.

SANDY RIVER, BIG, a river of the United States, which rises in the Laurel mountains, its sources interlocking with those of the Cumberland, Clinch, Kenhaway, Kentucky, and Licking. It forms part of the boundary between Virginia and Kentucky, running N.N.W. into the Ohio, forty miles above the Scioto. It has a course of about 130 miles, and at its mouth is 200 yards wide.

SANDY RIVER, **LITTLE**, a river of the United States, in Kentucky, running into the Ohio, twenty miles below Big Sandy.

SANDYS (Edwin), D. D., and archbishop of York, an eminent English prelate, and zealous reformer, born at Hawkshead, in Lancashire, in 1519. He was educated at St. John's College, Cambridge, where he graduated. About 1547 he was chosen master of Catherine Hall, and, in 1553, vice-chancellor of the university. Having early embraced the Protestant religion, he, on the death of king Edward VI., zealously espoused the cause of lady Jane Gray; preached a sermon in favor of her title, and even printed it. Two days after, being ordered to proclaim queen Mary, he refused, and was thereupon deprived of all his preferments, and sent prisoner to the Tower, where he lay above seven months, and was then removed to the Marshalsea. He was afterwards liberated; but bishop Gardiner, hearing he was an incorrigible heretic, made strict search after him. The doctor escaped, however, in May 1554, to Antwerp, and thence went to Augsburg, and Strasburg, where he remained for some time. In 1558 he went to Zurich, and lodged five weeks with Peter Martyr, with whom he maintained an intimate correspondence ever after. On queen Mary's death he returned to England, January 19th, 1558-9. In March he was appointed, by queen Elizabeth, one of the nine Protestant divines to dispute with nine Roman Catholics before the parliament. He was also appointed one of the commissioners for preparing the Liturgy. He was then made bishop of Worcester, and, being well skilled in the dead languages, he was, in 1565, one of the bishops appointed to make a new translation of the Bible; and he accordingly translated the books of Kings and Chronicles. In 1570 he was appointed bishop of London, and in 1571 assistant to the archbishop of Canterbury, in the commission against papists and puritans. In 1576 he was promoted to be archbishop of York. In his zeal against the papists he was very severe. He died July 10th, 1588, aged sixty-nine. He was twice married. By his second wife Cecilia, daughter of Sir Thomas Wilford, of Hartridge, in Kent, he had seven sons and two daughters.

SANDYS (George), was born in 1577. He travelled over several parts of Europe and the east; and published an account of his journey in folio, in 1635. He made an elegant translation of Ovid's *Metamorphoses*; and composed some poetical pieces of his own, that were greatly admired. He also paraphrased the *Psalms*; and left behind him a Translation, with Notes, of a Sacred Drama written by Grotius, entitled *Christus Patiens*; on which, with *Adamus Exul*, and *Masenius*, was founded *Lauder's* impudent charge of plagiarism against Milton. See **LAUDER**. He became one of the privy chamber to Charles I., and died in 1643.

SANGALLAN, or **CAPE GALLAN**, the Cannagallan of British seamen, is situated on the coast of Peru, N.N.W. of the island of Lobos, and three miles north-west of Carette island. On its south side is a good harbour, frequented by the coasting ships from Panama and Lima.

SANGAY, a volcanic mountain of South America, in the province of Quixos and Macas Quito. It rises to the height of 16,122 feet, and its north side is constantly covered with snow. From its summit, flames, smoke, and calcined matter, are seen continually to burst forth, accompanied with explosions, which are heard at Quito, 135 miles distant. The country adjacent is rendered totally barren by its incessant action.

SANGARIS, or **SANGARIUS**, in ancient geography and mythology, a river of Phrygia rising in Mount Dindymus, and falling into the Euxine. The god of this river was fabled to have been the father of Heecuba, queen of Troy; and she became pregnant of Altes, by gathering boughs of an almond tree on its banks.

SANGIAC, in the Turkish polity, the governor of a province. Hence also the province so governed: it was particularly used in Egypt, which was divided into twenty-four sangiaes.

SANGIR, an oblong island in the eastern seas, between thirty-six and forty miles in length, and between ten and fifteen miles in breadth. It extends in a direction N.N.W., and is broadest towards the north; towards the south it has several good bays, and is said to be surrounded by forty-six smaller islands of various dimensions. The coast has better harbours, and is less dangerous from hidden rocks and shoals, than most of the eastern islands. The island is well wooded and inhabited, and affords refreshments of all kinds. Spices are also procured, with which a trade is carried on to Magindanao. The principal town and bay are about the middle of the west coast, and called Taroona, in lat. 3° 28' N., long. 125° 44' E.

SANGUIFEROUS, *adj.*

SANGUIFICATION, *n. s.*

SANGUIFIER,

SANGUIFY, *v. a.*

SANGUINARY, *adj.*

SANGUINE, *adj.*

SANGUINESS, *n. s.*

SANGUINITY,

SANGUINEOUS, *adj.*

Fr. *sanguin*;
Lat. *sanguifer*,
sanguis. Con-
veying blood:
sanguification is
the production of
blood: sanguifier,
a producer of
blood: to san-
guify, to produce blood: sanguinary, bloody;
cruel; murderous (always used in a bad sense):
sanguine, as a noun substantive, means blood
color: as an adjective, red; having the color of
blood; cheerful; ardent; abounding with blood:
sanguineous and sanguinity, heat; ardor; con-
fidence: sanguineous, constituting blood, or
abounding in blood.

A griesty wound,
From which forth gushed a stream of gore, blood
thick,
That all her goodly garments stained around,
And in deep sanguine dyed the grassy ground.

Faerie Queene.

This fellow
Upbraided me about the rose I wear;
Saying, the sanguine colour of the leaves
Did represent my master's blushing cheeks.

Shakspeare.

Rage, or phrensy, it may be, in some perhaps natural courage, or *sanguineous* of temper in others; but true valour it is not, if it knows not as well to suffer as to do. That mind is truly great, and only that which stands above the power of all extrinsic

violence; which keeps itself a distinct principality, independent upon the outward man.

Decay of Piety.

The scene is now more *sanguinary*, and fuller of actors: never was such a confused mysterious civil war as this.

Howell.

A stream of nec'trous humour issuing flowed
Sanguine.

Milton.

At the same time I think, I command: in inferior faculties, I walk, see, hear, digest, *sanguify*, and carnify, by the power of an individual soul.

Hale.

The choleric fell short of the longevity of the *sanguine*.

Browne.

This animal of Plato containeth not only *sanguineous* and reparable particles, but is made up of veins, nerves, and arteries.

Id.

Dire Tisiphone there keeps the ward,

Girt in their *sanguine* gown.

Dryden.

Though these faults differ in their complexions as *sanguine* from melancholy, yet they are frequently united.

Government of the Tongue.

Bitters, like choler, are the best *sanguifiers*, and also the best febrifuges.

Floyer on the Humours.

Since the lungs are the chief instrument of *sanguification*, the animal that has that organ faulty can never have the vital juices, derived from the blood, in a good state.

Arbuthnot.

A plethoric constitution, in which true blood abounds, is called *sanguineous*.

Id.

The fifth conjugation of the nerves is branched to the muscles of the face, particularly the cheeks, whose *sanguiferous* vessels it twists about.

Derham's Physico-Theology.

A set of *sanguine* tempers ridicule, in the number of fopperies, all such apprehensions.

Swift.

I very much distrust your *sanguinity*.

Id.

Passion transforms us into a kind of savages, and makes us brutal and *sanguinary*.

Broome.

SANGUINARIA, in botany, blood-wort, a genus of the monogynia order, and polyandria class of plants; natural order twenty-seventh, rhæadæ; cor. octopetalous: cal. diphyllous; the siliqua ovate and unilocular. There is only one species, viz.

S. Canadensis, a native of the northern parts of America, where it grows plentifully in the woods; and in spring, before the leaves of the trees come out, the surface of the ground is in many places covered with the flowers which have some resemblance to our wood anemone; but they have short naked pedicles, each supporting one flower at top. Some of these flowers will have ten or twelve petals, so that they appear to have a double range of leaves, which has occasioned their being termed double flowers; but this is only accidental, the same roots in different years producing different flowers. The plant will bear the open air in this country, but should be placed in a loose soil and sheltered situation, not too much exposed to the sun. It is propagated by the roots; which may be taken up and parted, in September, every other year. The Indians paint themselves yellow with the juice of these plants.

SANGUISORBA, in botany, greater wild burnet, a genus of the monogynia order, and tetrandria class of plants; natural order fifty-fourth, miscellanæ: cal. diphyllous; germen situated betwixt the calyx and corolla. The most remarkable species is—

S. officinalis, with oval spikes. This grows naturally in moist meadows in many parts of

Britain. The stalks rise from two to three feet high, branching towards the top; and are terminated by thick oval spikes of flowers of a grayish brown color, which are divided into four segments almost to the bottom. These are succeeded by four oblong cornered seeds. The leaves of this sort are composed of five or six pairs of lobes placed along a midrib, terminated by an odd one. These are heart-shaped, deeply dentated on their edges, and a little downy on their under sides. The cultivation of this plant has been greatly recommended as food to cattle.

SANHEDRIM, or **SANHEDRIN**, Heb. סנהדרין, was the name whereby the Jews called the great council of the nation, assembled in an apartment of the temple of Jerusalem, to determine the most important affairs both of their church and state. This council consisted of seventy senators. The room they met in was a rotunda, half of which was built without the temple, and half within; that is, one semicircle was within the compass of the temple, the other semicircle was without, for the senators to sit in, it being unlawful for any one to sit down in the temple. The nasi, or prince of the sanhedrim, sat upon a throne at the end of the hall, having his deputy at his right hand and his sub-deputy on his left. The other senators were ranged in order on each side. The rabbins assert that the sanhedrim has always subsisted in their nation from the time of Moses down to the destruction of the temple by the Romans. See Grotius's Commentaries, and his book *De jure Belli et Pacis*, lib. i. c. 3, art. 20, and Selden de *Synedriis veterum Hebræorum*; also Calmet's Dissertation on the Polity of the ancient Hebrews, before his Comment upon the Book of Numbers. As to the qualifications of the judges, their birth was to be untainted. They were often taken from the race of the priests or Levites, or out of the number of the inferior judges, or from the lesser sanhedrim, which consisted only of twenty-three judges. They were to be skilful in the law, traditional and written. Eunuchs were excluded from the sanhedrim, usurers, decrepit persons, players at games of chance, such as had any bodily deformities, those that had brought up pigeons to decoy others to their pigeon-houses, and those that made a gain of their fruits in the sabbatical year. Some also exclude the high-priest and the king, because of their power; but others insist that the kings always presided in the sanhedrim, while there were any kings in Israel. Lastly, the members of the sanhedrim were to be of a mature age, a handsome person, and of considerable fortune. Such at least are the requisites mentioned by the rabbins. The authority of the great sanhedrim was, according to these authors, very extensive. This council decided such causes as were brought before it by appeal from the inferior courts. The king, the high-priest, the prophets, were under its jurisdiction. If the king offended against the law, if he kept too many horses, if he hoarded up too much gold and silver, the sanhedrim, according to these rabbins, had him stripped and whipped in their presence. But whipping among the Hebrews was not ignominious; and the king is said to have borne this correction by way

of penance, and himself made choice of the person that was to exercise this discipline. The general affairs of the nation were also brought before the sanhedrim. The right of judging in capital cases belonged to this court, and this sentence could not be pronounced in any other place but in the hall called Laschat haggazith, or the hall paved with stones, supposed by some to be the *Αἰθροπωτος*, or pavement, mentioned in John xix. 13. Hence the Jews were forced to quit this hall when the power of life and death was taken out of their hands, forty years before the destruction of their temple, and three years before the death of Jesus Christ. In the time of Moses this council, say the rabbies, was held at the door of the tabernacle of the testimony. As soon as the people were in possession of the land of promise, the sanhedrim followed the tabernacle. It was kept successively at Gilgal and Shiloh, at Kirjath-jearim, at Nob, at Gibeon in the house of Obededom; and, lastly, it was settled at Jerusalem till the Babylonish captivity. During the captivity it was kept up at Babylon. After the return from Babylon it continued at Jerusalem to the time of the Sicarii or Assassins. Then, finding that these profligate wretches whose number increased every day sometimes escaped punishment by the favor of the president or judges, it was removed to Ithan, which were certain abodes, situated, as the rabbies tell us, upon the mountain of the temple. Thence they came down into the city of Jerusalem, withdrawing themselves by degrees from the temple. Afterwards they removed to Jamnia, thence to Jericho, to Uzza, to Sepharvaim, to Bethsanim, to Sephoris, last of all to Tiberias, where they continued to the time of their utter extinction. This is the account which the Jews give us of the sanhedrim. But the learned do not agree with them in all this. F. Petau fixes the date of the first sanhedrim, when Gabinius was governor of Judea, who, according to Josephus, erected tribunals in the five principal cities of Judea; Jerusalem, Gadara, Anithus, Jericho, and Sephora or Sephoris, in Galilee. Grotius places the origin of the sanhedrim under Moses, as the rabbies do; but he makes it terminate at the beginning of Herod's reign. Basnage places it under Judas Maccabæus, or his brother Jonathan. We see, indeed, under Jonathan Maccabæus, that the senate with the high-priest sent an embassy to the Romans. The rabbies say that Alexander Jannæus, king of the Jews, of the race of the Asmonæans, appeared before the sanhedrim, and claimed a right of sitting there, whether the senators would or not. Josephus informs us that, when Herod was but yet governor of Galilee, he was summoned before the senate, where he appeared. It must be therefore acknowledged that the sanhedrim was in being before the reign of Herod. It was in being afterwards, as we find from the gospel and from the Acts. Jesus Christ, in St. Matthew (v. 22), distinguishes two tribunals. 'Whosoever is angry with his brother without a cause shall be in danger of the judgment.' This, they say, is the tribunal of the twenty-three judges. 'And whosoever shall say to his brother, Raca shall

be in danger of the council;' that is, of the great sanhedrim, which had the right of life and death, at least generally, and before this right was taken away by the Romans. See Mark xiii. 9, xiv. 55, xv. 1; Luke xxii. 52. 66; John xi. 47; Acts iv. 15, v. 21, where mention is made of the synedion or sanhedrim. The origin of the sanhedrim is involved in uncertainty; for the council of the seventy elders established by Moses was not what the Hebrews understand by sanhedrim. Besides we cannot perceive that this establishment subsisted either under Joshua, the judges, or the kings. We find nothing of it after the captivity, till the time of Jonathan Maccabæus. The tribunals erected by Gabinius were very different from the sanhedrim, which was the supreme court of judicature, and fixed at Jerusalem; whereas Gabinius established five at five different cities. Lastly, this senate was in being in the time of Jesus Christ; but it had no longer then the power of life and death. John xviii. 31.

SANICULE, **SANICULA**, or self-heal, in botany, a genus of the digynia order, and petandria class of plants; natural order forty-fifth, umbellatæ. The umbels are close together, almost in a round head; the fruit is scabrous; the flowers of the disk abortive. There are three species, viz.

1. *S. Canadensis*, sanicle of Canada.
2. *S. Europæa*, European self-heal; and,
3. *S. Maralandica*, the sanicle of Maryland; all of which are found in many parts both of Scotland and England. These plants were long celebrated for healing virtues, but are now disregarded.

SANIES, *n. s.* Lat. *sanies*. Thin matter; serous excretion.

It began with a round crack in the skin, without other matter than a little *sanies*. *Wiseman.*

Observing the ulcer *sanious*, I proposed digestion, as the only way to remove the pain. *Id.*

But bolder grown, at length inherent found
A pointed thorn and drew it from the wound.
The cure was wrought; he wiped the *sanious* blood
And fume and free from pain the lion stood. *Couper.*

SANIES, in surgery, is a serous putrid matter, issuing from wounds. It differs from pus, which is thicker and whiter.

SANITY, *n. s.* Lat. *sanitas*. Soundness of mind.

How pregnant, sometimes, his replies are!
A happiness that madness often hits on,
Which *sanity* and reason could not be
So prosperously delivered of. *Shakspeare. Hamlet.*

SANNAZARIUS (James), a celebrated Latin and Italian poet, born at Naples in 1458. He ingratiated himself into the favor of king Frederick; and, when that prince was dethroned, attended him into France, where he staid with him till his death, which happened in 1504. Sannazarius then returned into Italy, where he applied himself to polite literature, and particularly to Latin and Italian poetry. His gay and facetious humor made him sought for by all companies; but he was so afflicted on hearing that Philibert, prince of Orange, general of the emperor's army, had demolished his country house, that it threw him into an illness, of which he died in 1530. He wrote a great number of

Italian and Latin poems: among those in Latin his *De Partu Virginis* and *Eclogues* are chiefly esteemed; and the most celebrated of his Italian pieces is his *Arcadia*.

SAN-PIETRO, or **SAMPIERO**, called also *Bas-tilica*, from *Bastia*, in *Corsica*, his birth-place, was a celebrated general in the French service, under *Francis I.*, *Henry II.*, and *Charles IX.* He bore arms at an early age against the *Genoese*, and by his valor and military skill soon became formidable to them. He married *Vanini Ornano*, a rich and beautiful heiress, only daughter of the viceroy of *Corsica*. Still inveterate against the *Genoese*, he went into France with his wife and family, where he served the court successfully during the civil wars. He then set out for *Constantinople* to solicit the grand signior to send a fleet against the *Genoese*. Mean time the *Genoese* sent their agents to his wife, then at *Marseilles*, soliciting her to return to her native country, promising the restoration of her fortune, and even giving hopes of a pardon to her husband. The credulous *Vanini* was persuaded. She set out with her furniture, jewels, and family, for *Genoa*. A friend of *San-Pietro's* armed a ship, pursued her, brought her back to France, and delivered her to the parliament of *Aix*. *San-Pietro*, returning from *Constantinople*, was enraged. He then went to *Aix*, and demanded his wife, and afterwards murdered her. He immediately after set out for *Paris*, appeared before *Charles IX.*, confessed his crime, pleaded his former services, and demanded a pardon. The whole court was shocked, but the pardon was granted in 1567. He was soon after, however, assassinated by the brothers of his wife.

SANQUEL, one of the largest rivers of South America, in *Patagonia*. It has its rise in the snowy mountains of the *Cordillera*, on the east side, and derives its name from a thorny, thick, and rough reed, called *sanquel*, with which the country between this river and the first *Desaguero* abounds. It makes its first appearance at a place called *Diamante*, whence the *Spaniards* sometimes call it the *Rio del Diamante*. It has a course of 300 miles, and enters the *Rio Negro* by a wide mouth.

SANQUIAR, a royal borough, seated on the *Nith*, on the borders of *Ayrshire*; nearly equidistant from the *Solway Frith* and the *Atlantic*. It has one principal street, about a quarter of a mile long, and has long been famed for its woolen manufactures. *Sanquhar* was erected into a burgh of barony in 1484; but had previously been a burgh from time immemorial, as that charter relates. *King James VI.* made it a royal borough in 1596. It is governed by a provost, three bailiffs, dean of guild, treasurer, and eleven counsellors. It joins with the boroughs of *Dumfries*, *Annan*, *Kirkcudbright*, and *Lochmaben*, in electing a representative in the imperial parliament. It lies twenty-seven miles N. N. W. of *Dumfries*, thirty-two north of *Kirkcudbright*, and thirty-three from *Ayr*.

SANS, *prep.* *Fr. sans.* Without. Out of use.

Last scene of all,
That ends this strange eventful history,
Is second childishness and mere oblivion,
Sans teeth, *sans* eyes, *sans* taste, *sans* every thing.

Shakspeare.

SANSANDING, a large town of Central Africa, in the state of *Bambarra*. It is situated on the *Niger*, and has a considerable trade, particularly in salt. The market-place is an extensive square, constantly crowded, where the different articles are exposed on stalls, roofed with mats. The currency is in cowries, 3000 of which go to a monkali of gold, valued at 12s. 6d. sterling. Twenty-five miles north-east of *Sego*.

SANS-CULOTTES, *Fr.* from *sans*, without, and *culottes*, breeches; a term of contempt, used by the proud noblesse of France under the ancient despotism, towards those of the inferior ranks. This rankled in the minds of the people, when they got the power into their hands, and the plebeians, in the pride of their power, at last ennobled this term of reproach, and some of their bravest generals in their despatches announcing their victories, gloried in having been born *sans-culottes*. The term and its fate merit preservation in a work of science, as a caveat against the pride of the higher ranks and the folly of the lower.

SANSON (*Nicholas*), a celebrated French geographer, born at *Abbeville*, in *Picardy*, December 12th, 1600. Having finished his studies, he entered into business as a merchant, but, meeting with considerable losses, he gave up merchandise, and applied himself to geography; his father having studied that science, and published several maps. In 1619 he completed a map of ancient Gaul, which was very favorably received, and encouraged him to further exertions. After this he published about 300 large maps of different countries, ancient and modern; and caused 100 tables to be engraved, exhibiting the divisions of modern Europe. He also published several tracts to illustrate his maps; as, 1. Remarks upon the Ancient Gauls; 2. A Treatise on the Four Parts of the World; 3. Two Tables of the Cities and Places in the Maps of the Rhine and Italy; 4. A Description of the Roman Empire, of France, Spain, Italy, Germany, and the British Isles; together with the ancient Itineraries. He also wrote: 5. The Antiquity of *Abbeville*, which involved him in a controversy with *F. L'Abbe*, the Jesuit, and others; 6. Sacred Geography; and, 7. A Geographical Index of the Holy Land. Cardinal *Richelieu* and *Mazarine* patronised him greatly; and the latter appointed him royal geographer. He died in *Paris*, while preparing an Atlas of all his maps, in 1667; leaving two sons.

SANSONATE, a district and town of *Guatemala*, to the southward of *Suchitepec*. The town is a sea-port, and is situated 120 miles south-east of the city of *Mexico*, with about 2000 inhabitants. The population of the district is about 40,000, consisting almost entirely of *Indians*, *mulattoes*, and *negroes*, and its capital is *La Trinidad* or *Sansonate*, situated on the river *Sansonate*, at its mouth.

SANSOVINO (*James*), an eminent sculptor and architect, born in *Florence* in 1479. The mint, and the library of *St. Mark*, at *Venice*, were magnificent specimens of his skill. He was so highly esteemed at *Venice*, that, when a general tax was laid on the inhabitants, he and *Titian* alone were exempted. He died in that city, in 1570, at the age of ninety-one.

SANTA BARBARA, a sea-port and settlement of New California, visited by Vancouver in 1793, who gave the name of Point Felipe to the west point of its harbour. The interior a few miles only from the sea coast is composed of rugged barren mountains, which rise in five distinct ridges a great distance inland, and to the east. Vancouver says that the sheep and poultry at this settlement exceed, both in size and delicacy of flavor, those of any of the other settlements which he visited. Santa Barbara was founded in 1786, and lately contained 1100 inhabitants. It is garrisoned by about sixty soldiers, out of which it affords guards also to the mission of the same name. Long. $240^{\circ} 43' E.$, lat. $34^{\circ} 24' N.$

SANTA CRUZ, the capital of the island of Teneriffe, and residence of the governor of the Canaries, is also the centre of the trade of these islands. Here reside all the consuls and commissaries of foreign powers, and this port may be considered as a great caravansary on the road between America and the Indies. It is situated in a plain, surrounded by barren mountains, and its only natural advantage is a road, which affords safe anchorage in deep water, where ten or twelve ships of war may lie. A mole stretches out into the sea, which is rounded at the extremity, to afford a landing place, and is ascended by a stair at the top of which is placed the custom-house, which it is thus impossible to avoid. The streets are tolerably broad, and generally well built. The houses have all a wide court in the interior. Travellers remark the vast number of ecclesiastics seen on the streets, and of the impurity of beggars. The population is about 8400.

SANTA CRUZ DE LA SIERRA, a town and province of Buenos Ayres, founded in 1558, and afterwards removed 150 miles more to the south, to the place where it now stands, in lat. $14^{\circ} 20' S.$, at the foot of a chain of mountains, which bounds the country of the Chiquitos Indians to the north, and thence runs in a north-east direction to Lake Xarayes. It was at first called San Lorenzo, and stands on the Puapay.

SANTALUM, in botany, a genus of the monogynia order, and octandria class of plants: *cal.* superior: cor. monopetalous; the stamina placed in the tube; the stigma is simple; the fruit a berry. It grows to the size of a walnut-tree. Its leaves are entire, oval, and placed opposite to each other. Its flower is of one single piece, charged with eight stamina, and supported upon the pistil, which becomes an insipid berry, resembling in form that of the laurel. Its wood is white in the circumference, and yellow in the centre when the tree is old. This difference of color constitutes two kinds of sanders, both employed for the same purposes, and having equally a bitter taste, and an aromatic smell. With the powder of this wood a paste is prepared with which the Chinese, Indians, Persians, Arabians, and Turks, anoint their bodies. It is likewise burnt in their houses, and yields a fragrant and wholesome smell.

1. *S. album*, white sanders, is brought from the East Indies in billets, about the thickness of a man's leg, of a pale whitish color. It is that

part of the yellow sanders wood which lies next the bark. Great part of it, as met with in the shops, has no smell or taste, nor any sensible quality that can recommend it to the notice of the physician.

2. *S. flavum*, yellow sanders, is the interior part of the wood of the same tree which furnishes the white, is of a pale yellowish color, of a pleasant smell, and a bitterish aromatic taste, accompanied with an agreeable kind of pungency. Distilled with water it yields a fragrant essential oil, which thickens in the cold into the consistence of a balsam. Digested in pure spirit it imparts a rich yellow tincture; which, being committed to distillation, the spirit arises without bringing over any thing considerable of the flavor of the sanders. Hoffman looks upon this extract as a medicine of similar virtues to ambergris; and recommends it as an excellent restorative in great debilities.

3. *S. rubrum*, red sanders, though in less estimation, and less generally used, is sent by preference into Europe. This is the produce of a different tree, which is common on the coast of Coromandel. Some travellers confound it with the wood of Caliatour, which is used in dyeing. See *PTEROCARPUS*.

SANTANDER, or St. Andero, a province of Spain, called also, and more correctly, Las Montanas de Santander and de Burgos, or simply Las Montanas, stretching along the southern shore of the Bay of Biscay, between Asturias, Old Castile, and Biscay Proper. It consists of steep mountains and valleys, and the produce varies greatly, according to the elevation. The valleys produce maize; and the pasturage, whether on the plains or on the slope of the hills, is in general good. It contains mines of the finest iron; and there are foundries of artillery and steel at La Cavada and Liérganes. The coast has the excellent harbours of St. Vincent de la Barquera, Santillana, Castro de Urdiales, Santander, Laredo, and, above all, Santona. Ships of war are built at Guarnizo. This province formed part of the ancient Cantabria.

SANTANDER, the capital of the foregoing province, is situated on the declivity of a hill, in a circular peninsula, to the east of Santillana. Its port is of easy access for merchant vessels of all sizes; frigates of forty guns must wait the flow of the tide before they can pass the bar. The harbour is protected by two forts or castles, and the entry of vessels into the inner basin facilitated by a fine pier. Santander was long one of the ports called *habilitados*, or authorised to carry on a free trade with Spanish America. It also exports considerable quantities of wool. Population 10,000. Since 1754 it has been the see of a bishop. Fifty miles north-west of Bilbao, and seventy-nine north of Burgos.

SANTEE, a river of South Carolina, United States, formed by the union of the Congaree and Wateree. It runs into the sea by two mouths, twenty miles below Georgetown. This river affords a navigation at some seasons nearly 300 miles, and is connected with Cooper River by a canal. The main branch in North Carolina is called Catawba.

SANTEUIL, or **SANTEUL** (John Baptist), de,

was born in Paris in 1630. Having finished his studies in Louis XIV.'s college he applied himself entirely to poetry, and celebrated in his verses the praises of several great men. He was caressed by all the learned men of his time; and Louis XIV. gave him a pension. He attended the duke of Bourbon to Dijon, when that prince went thither to hold the states of Burgundy; and died there in 1697, as he was preparing to return to Paris. Besides his Latin hymns, he wrote a great number of Latin poems.

SANTIPORE, a town and celebrated factory of the East India Company in Bengal, district of Kishenagur. The factory chiefly purchases muslins, saunahs, sugar, and rum. It is esteemed one of the healthiest places in Bengal. Long. $28^{\circ} 34' E.$, lat. $23^{\circ} 13' N.$ There is another place of the same name in Allahabad.

SANTOLINA, lavender cotton, in botany, a genus of the polygamia æqualis order, and syngenesia class of plants; natural order forty-ninth, compositæ. The receptacle is paleaceous; there is no pappus: cal. imbricated and hemispherical. The most remarkable species are these:—

1. *S. chamæcypariss*, the common lavender-cotton, has been long known in the English gardens; it was formerly called *abrotanum fœmina*, or female southernwood, and by corruption *bro-tany*; it grows naturally in Spain, Italy, and the warm parts of Europe. It has a ligneous stalk, dividing into many branches, garnished with slender, hoary, indented, leaves, that have a rank strong odor when handled. The branches are terminated by a single flower, composed of many hermaphrodite florets, which are sistular, cut into five parts at the top, of a sulphur-yellow and included in one common scaly empalement, having no borders or rays. These are succeeded by small, oblong, striated seeds, which are separated by scaly chaff, and ripen in the empalement; the plants thrive in a dry soil and a sheltered situation.

2. *S. chamæmelifolia*, with obtuse woolly leaves, has shrubby stalks, which rise three feet high, garnished with broader leaves than any of the other, whose indentures are looser, but double; they are hoary, and when bruised have an odor like chamomile. The leaves are placed pretty far asunder, and the stalks are garnished with them to the top. The stalks are divided likewise at the top into two or three foot-stalks, each sustaining one pretty large sulphur-colored flower.

3. *S. decumbens*, with linear leaves, is of a lower stature than either of the former, seldom rising more than fifteen or sixteen inches high. The branches spread horizontally near the ground, and are garnished with shorter leaves than either of the former, which are hoary and finely indented; the stalks are terminated by single flowers, of a bright yellow color, which are larger than those of the first sort.

4. *S. rosmarinifolia*, with linear entire leaves, and shrubby stalks, which rise about three feet high, sending out long slender branches, garnished with single linear leaves of a pale-green color. The stalks are terminated by large, single, globular flowers, of a pale sulphur-color.

5. *S. villosa*, with woolly leaves, has a shrubby

stalk, which branches out like the first, but the plants seldom grow so tall. The branches are garnished very closely below with leaves; the flowers are of a deep sulphur-color. It grows naturally in Spain.

6. *S. virens*, with very long linear leaves, rises higher than any other of this genus. The branches are more diffused; they are slender, smooth, and garnished with very narrow long leaves, which are of a deep green color; the stalks are slender, naked towards the top, and terminated by single flowers of a gold color. All these plants may be cultivated so as to become ornaments to a garden, particularly in small bosquets of ever-green shrubs, where, if they are artfully intermixed with other plants of the same growth, and placed in the front line, they will make an agreeable variety; especially if care be taken to trim them twice in a summer, to keep them within bounds, otherwise their branches are apt to straggle, and in wet weather to be borne down and displaced, which renders them unsightly; but, when they are kept in order, their hoary and different colored leaves will have a fine effect in such plantations. They may be propagated by planting slips or cuttings during the spring, in a border of light fresh earth, but must be watered and shaded in hot dry weather, until they have taken root; after which they will require no farther care but to keep them clean from weeds till autumn, when they should be transplanted where they are designed to remain; but, if the ground is not ready by that time to receive them, let them remain in the border until spring; for if they are transplanted late in autumn, they are liable to be destroyed by cold in winter.

SANTORINI, **SANTORIN**, **St. ERINI**, or **St. IRENE**, the ancient Thera and Calista, an island in the Grecian archipelago, between Naphio, Nio, and Candia. Its length and greatest breadth are about eight miles. It has the form of a crescent, and between its two points are the small islands of Therasia and Aspronisi, within which again are three others. All seem of volcanic origin, and have risen at different periods from the sea: Santorini being almost entirely covered with pumice-stone, ashes, and other volcanic substances. It is, however, well cultivated, and produces barley, cotton, vines, almonds, figs, and various fruits. Population 10,000. Long. $25^{\circ} 36' E.$, lat. $36^{\circ} 28' N.$

SANTOS, a well-built town and port of St. Pauls, Brazil, is the storehouse of the province, and the resort of many vessels trading to the Rio de la Plata. The rice and bananas of the district, which are grown in great quantities, are considered the best in Brasil. It also exports sugar, coffee, rum, rice, mandioca, indigo, &c.

As Santos is the embarking place of St. Paul's, its intercourse with that town is very considerable. In the course of a day several hundred mules arrive, loaded with the produce of the country, and return with salt, iron, copper, earthenwares, and European manufactures. It has convenient water carriage, its river being navigable about twenty miles up to Cuberion, where an officer with a guard of soldiers is stationed to receive the duties, for the repair of the

roads, &c. The harbour has a safe entrance, and is very secure, being a strait, with the island of St. Vincent to the left, for the extent of half a mile. The high land occasions much variation in the winds. The part called the narrows is defended by two forts, on passing which there is a kind of lagoon of three or four leagues in length, almost full of mangroves. Population 7000. Long. $46^{\circ} 21' W.$, lat. $23^{\circ} 59' 30'' S.$

SANZ (—), a learned Spanish Dominican, who was made a bishop by the pope, and was sent out as a missionary to China in 1715. The pope afterwards appointed him vicar for the province of Fokien. But a persecution arising against the Christians, he was beheaded at Macao, in 1747.

SAONA, an island of the West Indies, to the south-east end of Hispaniola. From the sea it has a low level appearance, and is twenty-one miles in extent, and seven wide. Its nearest or north-west part is only half a league from Point Palmilla. The flats and rocks around the island are very visible, even at a great depth, from the limpid state of the water. Its west harbour is in the west end. A range of small hills in the middle, facing the south, tempers the climate, and fertilises the soil. It abounds in fish, and terrestrial and aquatic wild birds. Saona, by the natives called Adamaney, once boasted a cacique, and subjects independent of Haiti, and was afterwards held by the Jesuits, who improved its soil, and had several settlements here. At present it lies neglected, except by a few solitary fishermen, who annually visit it, to collect tortoise shell, or ensnare the wild cattle. It was discovered by Columbus in 1494. Long. $69^{\circ} 42' W.$, lat. $18^{\circ} 8' N.$

SAONE, a river of France, which, rising among the Vosges mountains, passes by Chatillon, Gray, Auxonne, Verdun, Chalons, Macon, &c., and, after a course of about 200 miles, joins the Rhone at Lyons. In its course it receives the Doubs, Ouche, and other streams, and is navigable to Auxonne. It gives name to the following departments:—

SAONE, UPPER, a department of France, including the northern part of Franche Comté. and enclosed on the north by that of the Vosges, and on the east by that of the Upper Rhine. Its superficial extent is about 2500 square miles. and very mountainous, being intersected by branches of the Vosges chain. The principal rivers are the Saone, the Oignon, the Drugeon, and the Amanee. The climate is temperate: the soil generally stony, but in some places highly fruitful. The principal products are corn, timber, hemp, wine, and fruit. Of mineral products, iron and coal are the most important. The department belongs to the sixth military division, and to the jurisdiction of the cour royale of Besançon. It is divided into three arrondissements, twenty-seven cantons, and 640 communes. The chief town is Vesoul. Population 312,000.

SAONE AND LOIRE, a department of France, comprehending the southern part of Burgundy, and bounded by the departments of the Jura, the Rhone, and the Allier. It has a superficial extent of 3500 square miles, covered with moun-

tains, hills, and forests, but separated by extensive plains and valleys. The principal rivers are the Saone, the Loire, the Arroux, the Doubs, and the Seille. This department contains also a canal which joins the Saone and Loire. The climate is salubrious; the soil in some places stony and sandy; in others rich and fertile. The productions are vines, corn, and hemp, and various fruits; iron, marble, alabaster, crystal, coal, and other minerals, are also abundant. The Macon wine of this department is celebrated. It belongs to the eighteenth military division, to the diocese of Autun, and the jurisdiction of the cour royale of Dijon, and is divided into the five arrondissements of Macon, (the capital), Autun, Chalons, Charolles, and Louhans.

SAP, *n. s., v. a., & v. n.* } Saxon *sape*;
 SAP'LESS, *adj.* } Belg. *sap*; Lat.
 SAP'RY. } *sapa*. The vital juice of plants; the juice that rises and circulates in trees and herbs: hence to undermine; subvert; proceed by secret means; the adjectives both corresponding.

Now sucking of the *sap* of herbs most sweet,
Or of the dew which yet on them doth lie,
Now in the same bathing his tender feet. *Spenser*
Though now this grained face of mine be hid
In *sap* consuming winter's drizzled snow,
And all the conduits of my blood froze up,
Yet hath my night of life some memory. *Shakspeare.*

Pitiless arms, like to a withered vine,
That droops his *sapless* branches to the ground. *Id.*
This young prince was brought up among nurses,
till he arrived to the age of six years: when he had passed this weak and *sappy* age, he was committed to Dr. Cox. *Hayward.*

The tree of knowledge, blasted by disputes,
Produces *sapless* leaves instead of fruits. *Denham.*
His presence had infused
Into the plant sciential *sap*. *Milton.*
The *sap* at which the root is bred
In trees, through all the boughs is spread. *Waller.*
Their dwellings were *sapped* by floods,
Their houses fell upon their household gods. *Druden.*

If by this bribe, well placed he would ensnare
Some *sapless* usurer that wants an heir. *Id.*
Were turned to moisture for the body's use,
Supplying humours, blood, and nourishment. *Id.*

The *sappy* boughs
Attire themselves with blooms, sweet rudiments
Of future harvest. *Philips.*
For the better security of the troops, both assaults
are carried on by *sapping*. *Tatler.*
Vegetables consist of the same parts with animal
substances, spirit, water, salt, oil, earth; all which
are contained in the *sap* they derive from the earth. *Arbuthnot.*

In vain may heroes fight, and patriots rave,
If secret gold *saps* on from knave to knave. *Pope.*
This single stick was full of *sap*; but now in vain
does art tie that withered bundle of twigs to its *sapless* trunk. *Swift.*

No withered stumps disgrace the sylvan scene,
No longer fruitful, and no longer green;
The *sapless* wood divested of the bark,
Grows fungous, and takes fire at every spark. *Cowper.*

SAP. See BOTANY.

SAP, in sieges, is a trench, or an approach

made under cover, of ten or twelve feet broad, when the besiegers come near the place, and the fire from the garrison grows so dangerous that they are not able to approach uncovered. There are several sorts of saps; the single, which has only a single parapet; the double, having one on each side; and the flying, made with gabions, &c. In all saps traverses are left to cover the men.

SAPHIES, a kind of charms, consisting of some scrap of writing, which the credulous negroes believe capable of protecting them from all evil. The writers of saphies are generally Moors, who sell scraps of the koran for this purpose to a people who believe neither the koran nor the prophet. Accordingly any piece of writing may be sold as a saphie; and Mr. Park found the negroes disposed to place greater confidence in the saphies of a Christian than in those of a Moor. Mr. Park being at Koolikorro, a considerable town near the Niger, and a great market of salt, his landlord, hearing that he was a Christian, immediately thought of procuring a saphie. For this purpose he brought out his whalnia, or writing board, assuring me (says our author), that he would dress me a supper of rice if I would write him a saphie to protect him from wicked men. The proposal was of too great consequence to me to be refused; I therefore wrote the board full, from top to bottom, on both sides; and my landlord, to be certain of having the whole force of the charm, washed the writing from the board into a calabash with a little water; and, having said a few prayers over it, drank this powerful draught; after which, lest a single word should escape, he licked the board until it was quite dry. A saphie writer was a man of too great consequence to be long concealed. The important information was carried to the dooty, who sent his son with half a sheet of writing paper, desiring me to write him a naphula saphie (a charm to procure wealth). He brought me as a present some meal and milk; and when I had finished the saphie, and read it to him with an audible voice, he seemed highly satisfied with his bargain, and promised to bring me in the morning some milk for my breakfast. Our author contrived to turn this absurd superstition to his own advantage, by writing saphies for his subsistence when his money was exhausted.

SAPID, *adj.* } Lat. *sapidus*. Tasteful;
SAPIDITY, *n. s.* } palatable: making a power-
SAPIDNESS. } ful stimulation upon the
 palate: the noun-substantive corresponding.

Thus camels, to make the water *sapid*, do raise the mud with their feet. *Broome.*

As for their taste, if their nutriment be air, neither can it be an instrument thereof; for the body of that element is ingustible, and void of all *sapidty*.

Id. Vulgar Errors.

If *sapidness* belong not to the mercurial principle of vegetables and animals, it will scarce be discriminated from their phlegm. *Boyle.*

The most oily parts are not separated by a slight decoction, till they are disentangled from the salts; for if what remains of the subject, after the infusion and decoction be continued to be boiled down with the addition of fresh water, a fat, *sapid*, odorous,

viscous, inflammable, frothy water will constantly be found floating atop of the boiling liquor.

Arbutnot.

SAPIENCE, *n. s.* } Fr. *sapience*; Lat. *sa-*
SAPIENT, *adj.* } *scientia*. Wisdom; sage-
 ness; knowledge: the adjective corresponding.

Ne only they that dwell in lowly dust;

The sons of darkness and of ignorance;

But they whom thou, great Jove, by doom unjust,
 Didst to the top of honour e'er advance:

They now, put up with this disdainful insolence,

Despise the brood of blessed *sapience*. *Spenser.*

Because enterprises guided by ill counsels have equal success to those by the best judgment conducted, therefore had violence the same external figure with *sapience*. *Raleigh.*

King James, of immortal memory, among all the lovers and admirers of divine and human *sapience*, accomplished at Theobalds his own days on earth.

Wotton.

Sapience and love

Immense, and all his father in him shone. *Milton.*

There the *sapient* king held dalliance. *Id.*

By *sapience*, I mean what the ancients did by philosophy; the habit or disposition of mind which importeth the love of wisdom. *Grew.*

Many a wretch in Bedlam,

Though perhaps among the rout

He wildly flings his filth about,

Still has gratitude and *sapience*,

To spare the folks that give him ha'pence. *Swift.*

SAPINDUS, the soap-berry tree, in botany, a genus of the digynia order and octandria class of plants, natural order twenty-third, trihilatæ: cal. tetraphyllous, petals four: caps. corneous, walited, and ventricose. There are ten species, the following are the most important:—

1. *S. rigidus*, with rigid acute-winged leaves, grows in India. This has a strong woody stalk, which rises about twenty feet high, sending out many strong ligneous branches, covered with a smooth gray bark, and garnished with winged leaves, composed of many spear-shaped lobes; they are of a pale green, and sit close to the midrib, which has no border or wing like the other. The end of the branches are divided into two or three foot-stalks, each sustaining a loose spike of flowers; these are succeeded by roundish berries.

2. *S. saponaria*, with winged leaves, grows naturally in the islands of the West Indies, where it rises with a woody stalk from twenty to thirty feet high, sending out many branches garnished with winged leaves composed of several pairs of spear-shaped lobes. The midrib has a membranaceous or leafy border, running on each side from one pair of lobes to the other, which is the broadest in the middle between the lobes; the flowers are produced in loose spikes at the end of the branches; they are small and white, and make no great appearance. These are succeeded by oval berries, as large as middling cherries, sometimes single, at others two, three, or four are joined together; these have a saponaceous skin or cover, which encloses a very smooth roundish nut of the same form, of a shining black when ripe. The skin or pulp which surrounds the nuts is used in America to wash linen; but is very apt to burn and destroy it if often used, being of a very acrid nature.

3. *S. trifoliatius*, the three-leaved soap-berry

tree. All these plants are propagated by seeds; they must be put into small pots, and plunged into a hot-bed of tanner's bark. In five or six weeks the plants will appear, when the glasses of the hot-bed should be raised every day in warm weather, to admit fresh air to the plants. In three or four weeks after the plants appear they will be fit to transplant, when they must be shaken out of the pots, and carefully parted, so as not to injure their roots, and each planted into a separate small pot, and plunged into the hot-bed again, observing to shade them from the sun until they have taken new root; after which time they must have free air admitted to them every day when the weather is warm, and will require to be frequently watered.

SAP'LING, *n. s.* From *sap*. A young tree; a young plant.

Look how I am bewitched; behold mine arm
Is, like a blasted *sapling*, withered up. *Shakspeare.*

Nurse the *saplings* tall, and curl the grove
With ringlets quaint. *Milton.*

A *sapling* pine he wrenched from out the ground,
The readiest weapon that his fury found. *Dryden.*

Slouch turned his head, saw his wife's vigorous
hand

Wielding her oaken *sapling* of command. *King.*

What planter will attempt to yoke
A *sapling* with a falling oak? *Swift.*

SAPONACEOUS, *adj.* } *Lat. sapo, soap.*
SAP'ONARY. } Soapy; resembling
soap; having the qualities of soap.

By digesting a solution of salt of tartar with oil
of almonds, I could reduce them to a soft *sapponary*
substance. *Boyle.*

Any mixture of an oily substance with salt, may
be called a soap: bodies of this nature are called *saponaceous*. *Arbutnot.*

SAPONARIA, *sopewort*, in botany, a genus of the digynia order, and decandria class of plants, natural order twenty-second, caryophyllæ: *cal.* monophyllous and naked; there are five unguled petals: *caps.* oblong and unilocular. There are nine species. Of these the most remarkable is the—

S. officinalis, which is a British plant, has a creeping root, so that in a short time it would fill a large space of ground. The stalks are about two feet high, and of a purplish color. The foot-stalks of the flowers arise from the wings of the leaves opposite; they sustain four, five, or more purple flowers each; which have generally two small leaves placed under them. The stalk is also terminated by a loose bunch of flowers growing in form of an umbel; they have each a large swelling cylindrical empalement, and five broad obtuse petals, which spread open, of a purple color. These are succeeded by oval capsules, with one cell filled with small seeds. The decoction is used to cleanse and scour woollen cloths; the poor people of some countries use it instead of soap for washing; from which use it had its name.

SAPOR, *n. s.* *Lat. sapor.* Taste; power of affecting or stimulating the palate.

There is some *sapor* in all aliments, as being to be distinguished and judged by the gust, which cannot be admitted in air. *Broune.*

The shape of those little particles of matter which

distinguish the various *sapors*, odours, and colours of bodies.

SAPOR I., king of Persia, succeeded his father Artaxerxes about A. D. 438. He enlarged his dominions by taking Mesopotamia, Syria, and Cilicia; but proved a most haughty and cruel tyrant, particularly to the Roman emperor Valerian, whom he took prisoner, and after every possible insult put him to a cruel death. After this he was very unsuccessful; was repeatedly defeated by Odenatus, prince of Palmyra; and at last assassinated by his own subjects, A. D. 273. He was succeeded by his son Hormisdas.

SAPOR II., king of Persia, grandson of Sapor I., succeeded his father Hormisdas, A. D. 310. He was a very active and warlike monarch, and proved very troublesome to the Romans. His victories alarmed the emperor Julian so much that he marched against him in person; but in a encounter with the troops of this prince received his mortal wound. Jovian made peace with Sapor; but the latter afterwards renewed hostilities, invaded Armenia, and defeated the emperor Valens. Sapor died A. D. 380, after a long and prosperous reign of seventy years.

SAPPERS are soldiers belonging to the royal artillery, whose business it is to work at the saps, for which they have an extraordinary pay. A brigade of sappers generally consists of eightmen, divided equally into two parties; and, whilst one of these parties is advancing the sap, the other is furnishing the gabions, fascines, and other necessary implements. They relieve each other alternately.

SAPPIC and **ADONIAN**, or *adonic verse*, in the ancient poetry, a beautiful kind of verse, so named from Sappho, the poetess, and Adonis, the favorite of Venus. The Sapphic verses consisted of five feet each; of which the first was a trochee; the second a spondee; the third a dactyl; and the two last trochees. The Adonian consisted of five syllables, forming a dactyl and a spondee. Each stanza consisted of three lines Sapphic and one Adonian, thus:

Aürë-	ām quīs	quīs mēdi-	öerī-	tütēm
Diri-	git, tu	tus caret	obso-	leti
Sordi-	bus tec-	ti, caret	invi-	denda
			Sobrius	aula.

SAPPHIRA, the wife of a rich merchant in Gueldres, equally distinguished for her beauty and her misfortunes. Rhinsauld, a German officer, and governor of the town of Gueldres, fell in love with her; and, not being able to seduce her either by promises or presents, he imprisoned her husband, pretending that he kept up a traitorous correspondence with the enemies of the state. Sapphira yielded to the passion of the governor to relieve her husband from chains: but private orders had already been given to put him to death. His unhappy widow, overwhelmed with grief, complained to Charles duke of Burgundy. He ordered Rhinsauld to marry her, and to make over to her all his possessions. As soon as the deed was signed, and the marriage over, Charles commanded him to be put to death. Thus the children of a wife whom he had seduced, and of a husband whom he had murdered, became lawful heirs to all his wealth.

SAPPHIRE, *n. s.* Lat. *sapphirus*. A precious stone of a blue color.

In enroled tuffs, flowers, puffed, blue and white, like *saphire*, pearl, in rich embroidery.

Shakspeare.

She was too *saphirine* and clear for thee ;
Clay, flint, and jet now thy fit dwellings be.

Donne.

A few grains of shell silver, with a convenient proportion of powdered crystal glass, having been kept three hours in fusion, I found the coliquated mass, upon breaking the crucible, of a lovely *saphirine* blue.

Boyle.

Saphire is of a bright blue color.

Woodward.

He tinctures rubies with their rosy hue,

And on the *saphire* spreads a heavenly blue.

Blackmore.

That the *saphire* should grow foul, and lose its beauty, when worn by one that is lecherous, and many other fabulous stories of gems, are great arguments that their virtue is equivalent to their value.

Derham.

SAPPHIRE, a genus of precious stones, of a blue color, and the hardest of all except the ruby and diamond. They are found in the same countries with these jewels, also in Bohemia, Alsace, Siberia, and Auvergne. M. Rome de l'Isle mentions one found at Auvergne, which appeared quite green or blue according to the position in which it was viewed. They are seldom found of a deep blue color throughout, or free from parallel veins. The late unfortunate Louis XVI. had one with a stripe of fine yellow topaz in the middle. Some are found half green and half red, and are foliated like the ruby. The finest sapphires come from the East Indies. In Scotland they have been found of a hardness and lustre equal to the oriental, both light and deep colored. When powdered, they are fusible with borax, magnesia, or microcosmic salt, into a transparent glass. Jameson considers it as a species of rhomboidal corundum. It is the telesie of Haüy, and the perfect corundum of Bournon. The following is Jameson's description of it abridged by Dr. Ure:—Colors blue and red; it occurs also gray, white, green, and yellow. It occurs in blunt-edged pieces, in roundish pebbles, and crystallised. The primitive figure is a slightly acute rhomboid, or double three-sided pyramid, in which the alternate angles are $86^{\circ} 4'$ and $93^{\circ} 56'$. The following are the usual forms:—a very acute, equiangular, six-sided pyramid; the same truncated on the summit; a perfect six-sided prism; an acute, double, six-sided pyramid; the same acuminate, or truncated in various ways. Splendent, inclined to adamantine. Cleavage parallel with the terminal planes of the prism. Fracture conchoidal. From transparent to translucent. Refracts double. Brittle. Specific gravity 4 to 4.2. Its constituents are,

	Klaproth.	Chenevix.
	Blue.	Red.
Alumina,	98.5	90.0
Lime,	6.5	7.0
Oxide of iron,	1	1.2
	Loss	1.8
	100.0	100.0

Infusible before the blowpipe. It becomes electrical by rubbing, and retains its electricity for several hours; but does not become electrical by heating. It occurs in alluvial soil, in the vicinity of rocks belonging to the secondary or floetz-trap formation, and imbedded in gneiss. It is found at Podsedlitz and Treblitz in Bohemia, and Hohenstein in Saxony; Expailly in France; and particularly beautiful in the Capellan mountains, twelve days' journey from Sirian, a city of Pegu. Next to diamond, it is the most valuable of the gems. The white and pale blue varieties, by exposure to heat, become snow-white, and when cut exhibit so high a degree of lustre that they are used in place of diamonds. The blue stone to which the ancients applied the name of sapphire was different from ours: it was spotted with golden spangles; it was, indeed, the same as the lapis lazuli.

SAPPHO, a celebrated poetess of antiquity, who has been often styled the Tenth Muse, born at Mitylene, in the isle of Lesbos, about A.C. 610. She was contemporary with Stesichorus and Alceus. The last was her countryman, and some think her suitor. A verse of this poet, in which he intimates to her his passion, is preserved in Aristotle, Rhet. lib. i. cap. 9, together with the damsel's answer. Of the numerous poems this lady wrote, nothing remains but some small fragments which the ancient scholiasts have cited; a hymn to Venus, preserved by Dionysius of Halicarnassus, and a short ode. She fell in love with Phaon, and did all she could to win him, but in vain. She followed him into Sicily, whither he retired to avoid her; and during her stay in that island composed the Hymn to Venus, still extant, in which she begs so ardently the assistance of that goddess. But her prayers proved fruitless; Phaon was cruel to the last, and Sappho at length went to the promontory Leucas, and threw herself into the sea. See **LEUCATE**. The Mitylenians held her merit in such high esteem, that they stamped their money with her image; and the Romans afterwards erected a noble statue of porphyry to her. Vossius says that none of the Greek poets excelled Sappho for sweetness of verse; and that she made Archilochus the model of her style, but softened the harshness of his expression. Rapin observes that Longinus had great reason to extol the admirable genius of this woman; for what remain of her works are delicate, harmonious, and impassioned to the last degree.

SARABAND, *n. s.* Fr. *sarabande*; Span. *zarabande*. A Spanish dance.

The several modifications of this tune-playing quality in a fiddle, to play preludes, *sarabands*, jigs, and gavots, are as much real qualities in the instrument as the thought is in the mind of the composer.

Arbutnot and Pope.

A **SARABAND** is a musical composition, in the triple time, the motions of which are slow and serious. See **MUSIC**. Saraband is also a dance to the same measure, which usually terminates when the hand that beats the time falls; and is otherwise much the same as the minuet. The saraband is said to be originally derived from the Saracens, and is usually danced to the sound of the guitar or castanettes.

SARACENS.

SARACENS, a name given to the former inhabitants of Arabia; so called from the word *sara*, which signifies a desert, as the greatest part of Arabia is; and, this being the country of Mahomet, his disciples were called Saracens.

Under the article ARABIA, and still more fully under MAHOMET, we have given an account of the rise, progress, and establishment of the Mahometan system of imposture and superstition; previous to which event the name of Saracens was hardly known in Europe. Of his flight from Mecca to Medina, A. D. 622, and consequent origin of the Mahometan era of the Hegira, we have also given a particular account, with his various and rapid successes, for ten years after the commencement of that era. By the year 631, the ninth of the Hegira, the principal men among the Arabs, and the whole of the Koreish, his most inveterate opponents, had submitted, and by the year 632 the whole peninsula of Arabia was reduced under his subjection and superstition. But in that year, the tenth of the Hegira, while fresh embassies of submission were daily arriving, this famous impostor died in Medina, in the chamber of his best beloved wife, in consequence of a poisoned dish presented to him three years before, by Zainoh, the daughter of Hareth, an Arabian chief, of which he had eaten but a small quantity. The death of Mahomet threw all Mecca into consternation. The veneration of the people was so great that they could hardly believe his death possible. Abu Becr, however, at last convinced them that, though God was immortal, his prophet was mortal.

Warm disputes followed between the Mohajerin and the Ansars; about the election of a caliph, as his successor. Ali, the son-in-law of Mahomet, who had married the prophet's daughter, Fatima, certainly had the best title; but Abu Becr was preferred by the influence of Omar, and chosen by both parties. Ali, after some remonstrances, submitted: but his superior right is defended even to the present period, by a numerous party of Mahometans, hence called Shites, or Sectaries. Upon Abu Becr's accession many of the Arabs refused to pay the tribute imposed on them by Mahomet; whereupon Abu Becr sent Khaled, with an army of 4500 men, who totally defeated them, brought off much plunder, and made many of them slaves. He also killed Moseilama, and defeated Toleiah, two pretended prophets, who attempted to imitate Mahomet in his posture. He next sent his son Osama into Syria, where he plundered the country and did much damage to the Greeks. He soon after sent Khaled to invade Irak, which he accomplished, and put an end to the kingdom of Ilra, collecting 70,000 pieces of money, and subjecting the people to tribute. He next prepared to invade Syria, and, having collected a great army, gave Yezid Ebn Abu Sosian the command of it, with the following among other advices:—‘Treat your men with lenity: if you

be victorious, kill neither old people, women, nor children: cut down no palm trees, nor burn any fields of corn: spare all fruit trees, and slay no cattle but such as you use: put none of the religious persons to the sword: offer no violence to the places they serve God in.’ The Greek emperor was much alarmed, and sent a party of Greeks to reconnoitre the enemy, who falling in with a party of Arabs, a battle ensued, in which the Greeks lost 1200 men, while the Saracens lost only 120. Many skirmishes followed, and much rich spoil was taken by the Saracens, and sent to the caliph. Another party of Greeks, however, were more successful against Abu Obeidah, whom they totally defeated, and who was therefore displaced by Abu Becr. Khaled was sent to reduce Bostra, a rich city of Syria, which he accomplished chiefly by treachery. Being joined by Obeidah's troops, he laid siege to Damascus with 45,000 men. The Greek emperor sent an army of 100,000 men, under general Werdan, to relieve it; but they were attacked by Derar Ebn Al Wazar, at the head of a numerous body of Saracens; and, though the Greeks were at first so successful as even to take Derar himself prisoner (who had plunged into the heart of the Christian army, killed the standard-bearer, and seized the standard, which was a cross richly adorned with precious stones), yet the Saracens completely defeated them, Khaled himself turning the fortune of the day, by arriving with a fresh body of foot and 1000 horse. Werdan, however, having still an army of 70,000 men, made a fresh attempt to relieve Damascus; but being again completely defeated, with the loss of 50,000 men, Damascus was soon after taken, A. D. 634; and that very day Abu Becr died of a consumption, aged sixty-three.

Abu Becr was succeeded by Omar I., who was saluted with the title of emperor of the believers, and replaced Abu Obeidah in the command, being displeased with Khaled for his cruelties; whereas Obeidah was mild and merciful to the Christians. Khaled, however, bore his disgrace with magnanimity, and swore he would obey the new caliph. Obeidah, however, some time afterwards voluntarily yielded the command to Khaled, as being possessed of more military skill. Under these commanders, the Saracens soon after reduced the fortresses of Kinnistrin, Baalbec, Adestan, Shaizar, and Hems: upon which the Greek emperor Heraclius sent against them an army of 240,000 men, under Manuel; but this numerous body was utterly defeated by Khaled, near a village called Yermouk; where, according to the Arabian historians, the Christians lost 150,000 men killed, and 40,000 prisoners, while the Arabs lost only 4030 men; but this seems incredible. The defeat of Yermouk was followed by the loss of Jerusalem, and all Palestine. Omar, hearing of the success of his troops, immediately set out to visit Jerusalem, in a kind of pilgrimage, being dressed in a coarse habit made of camels' hair, praying daily, and performing numberless su-

perstitious ceremonies by the way, as well as some signal acts of justice and mercy, and giving some striking instances of humility, by causing all his followers to eat with him without distinction. Upon his arrival he preached a sermon to his people; after which he signed the articles of capitulation, confirmed the inhabitants of Jerusalem in all their rights and privileges, and visited the temple of the resurrection, and other antiquities of that city, accompanied by Sophronius the patriarch, who with difficulty could prevail on him to change his dirty garments for others more becoming his dignity. After dividing the government of Syria between Abu Obeidah and Yezid Ebn Abu Sosian, ordering Amru Ebn Al As to invade Egypt, and leaving proper orders otherwise, he returned to Medina. Yezid then attacked Cæsarea, but found it stronger than he expected. Obeidah advanced to Aleppo, where Youkinna and John, two brothers, governed under Heraclius. Youkinna resolved to oppose the Saracens, and accordingly set out at the head of 12,000 troops; and, meeting with a party of Arabs, defeated them; but, in the mean time, the people of Aleppo, afraid of the consequences, if their city should be taken by storm, submitted to Abu Obeidah. On this Youkinna posted home to Aleppo in a rage, ordered them to annul their treaty, and, finding them not ready to comply, killed 300 of them, among whom was his own brother John. He was soon after attacked by the Saracens, and defeated with the loss of 3000 men; after which he was besieged by them in the citadel, from which he made repeated sallies, and killed great numbers of the Saracens. Abu Obeidah, after continuing the siege four months longer, at last wrote Omar that the citadel was impregnable, and proposed raising it. But Omar sent him a fresh reinforcement, with seventy camels, and orders to continue it. Among these new troops was an Arab of a gigantic size, named Dames; who, by his size and his ingenuity, in raising seven men perpendicularly upon his own and each other's shoulders, overtopped the walls in the night, got quietly in, killed the sentinels and the guards; and admitting Khaled, with a fresh party of Saracens, soon got complete possession of the citadel. Youkinna and some of the principal officers turned Mahometans. After this Youkinna proposed to Obeidah to betray into his hand Azar, an important fort, where his own cousin Theodoros was commandant, by going to him at the head of 100 Arabs dressed as Greeks. But, this piece of treachery was detected, Theodoros having heard of the plan; and Youkinna and his pseudo-Greeks were made prisoners. But the fort being reduced, Youkinna recovered his liberty; but was soon after taken prisoner a second time, and carried before Heraclius at Antioch. Here again he dissembled, and pretended that he was still a Christian, and had only professed Mahometanism to serve the emperor the more effectually; upon which Heraclius appointed him governor of Antioch, which the traitor soon after delivered up to the Saracens. Heraclius, disconsolate by these successive losses, was put by the king of Ghassan upon the ungenerous plan of attempting to get rid of Omar by assassination. The king accord-

ingly employed Wathek Ebn Mosafer, a resolute young Arab of his own tribe, on this dangerous enterprise. Wathek got a fair opportunity, by finding Omar sleeping under a tree, but was deterred by a lion, who came and licked the caliph's feet till he awoke: on which Wathek, considering this as miraculous, confessed his intention, turned Mahometan, and was pardoned. Obeidah then despatched a body of 1300 troops, under Meisarah Ebn Mesroux, to the mountainous parts of Syria. The Greeks surrounded them, and would have cut them all off, had not Khaled appeared at the head of 3000 Arabs. On this the Greeks fled, leaving their tents and rich effects to the Arabs. But Abdallah Ebn Hodasa, one of Omar's chief favorites, was taken prisoner, and sent to Constantinople. Omar wrote to Heraclius, requesting his release, which Heraclius generously granted, and sent along with him many valuable presents, particularly a jewel of immense value, which Omar sold, and put the price in the public treasury, though requested to keep it for his own use. About this time a negotiation for peace took place; but, Omar insisting upon an annual tribute, it failed. Mean time many skirmishes took place, and many heroic acts of prowess were performed by individuals on both sides. But the chief success was on the side of the Saracens. Khaled took Manbij, Beraa, Balis, Raaban, Douluç, Korus (the ancient Cyrus), and several other fortified towns. Prince Constantine, the son of Heraclius, finding his troops diminishing daily, took the advantage of a tempestuous night to escape to Cæsarea; which was soon after invested by Amru. Mean time Youkinna, by his old system of treachery, took Tripoli, and seized fifty ships, which had just arrived from Crete and Cyprus with a supply of arms and provisions, not knowing that the Saracens were possessed of it. With these he set out for Tyre, where he deceived the people, pretending to come as a friend, and opened the gates to Yezid. Constantine, hearing at Cæsarea of these losses, set sail with his family and all his wealth, leaving the citizens to make their best terms with Amru. The surrender of Cæsarea was followed by that of all the other cities and forts in Syria, from the Mediterranean to the Euphrates, in the eighteenth year of the Hegira, or A. D. 649, six years after the expedition commenced. To the miseries of war were added those of violent storms of hail, an epidemical distemper, and at last a pestilence, all within the course of this year, which the Arabs style the year of destruction. By this last plague, the Saracens lost 25,000 men; among whom were Abu Obeidah, Yezid, Abu Sosian, Serjabil, and other eminent characters. Amru after this set out for Egypt, and on his way took Tarma, a town on the isthmus of Suez. He next attacked Mesr, the ancient Memphis, which, after a siege of seven months, was betrayed to him by Al Mokawkas, the governor. He then proceeded to Alexandria, which, after defeating the imperial army, he invested. During the siege Amru himself was taken prisoner, but protected from detection by one of his own slaves giving him a box on the ear, while he was answering some questions proposed by the gover-

nor, who generously dismissed him without ransom. Amru nevertheless reduced Alexandria soon after, which was followed by the loss of the whole kingdom of Egypt; while his general Okba Ebn Nafe made himself master of all the country of Africa, between Barka and Zoweilah, including also what now forms the piratical kingdom of Tripoli. Soon after this a great famine raged in Arabia, particularly at Medina, where Omar then resided. Omar therefore wrote to Amru to send him a supply of corn, which he accordingly sent on a train of loaded camels, the first of which entered Medina when the last left Alexandria. But, this method proving tedious and expensive, Omar ordered Amru to clear the Amris Trajanus, now named Khalis, which runs through Cairo, of the sand which choked it. This Amru did, and thus rendered the communication from Egypt to Arabia easy. The Saracens, thus successful in the west, were no less so in the east. The capture of Irak, and destruction of Hira, brought on a war with the Persians. See PERSIA. On the departure of Khaled, the command of the troops was left with Abu Obeid Ebn Masud, Mothanna Ebn Haretha, Amru Ebn Hasen, and Salit Ebn Kis. Abu Obeid, having passed a river, was killed, and his troops in great danger; Mothanna retreated, re-passed the river without loss, and fortified his camp till he received supplies; his troops in the mean time ravaging Irak on the side next the Euphrates. A body of 12,000 Persian horse was sent against these invaders, under Mahran. The Persians had the advantage at first, and the Arabs retired, but were soon brought back by Mothanna: the battle lasted from noon till sunset; at last Mothanna engaging Mahran in single combat laid him dead at his feet; on which the Persians fled. After this a powerful army was sent under the Persian general Rustam; but he was also killed, and his troops dispersed. Abu Musa, another Saracen general, defeated a formidable body under Al Harzaman, a noble Persian, at Athwaz. But of all Omar's generals, Saad Ebn Abu Wakkas was the most successful. With 12,000 troops he advanced to Kadesia, a city bordering on the deserts of Irak; where, having defeated an army of 120,000 Persians, he took the rich city of Al Madayen, with Yezdegerd's treasure; which was so rich that Saad took out of it 3000,000,000 of dinars, or £2025,000,000 sterling; besides the royal plate, the crown and royal garments, another treasure of 10,000,000 of crowns, and a piece of silk tapestry sixty cubits square, so richly adorned with gold, silver, and jewels, that Omar having cut it in pieces, and distributed it among the Saracens, a small part of it, which fell to Ali's share, sold for 20,000 crowns. In the twenty-first year of the Hegira the Saracens, still unsatisfied with conquest, invaded Mesopotamia, under Aiyad Ebn Ganem, where the city of Edessa submitted at the first summons. He next marched to Constantinople, the ancient Nicephorum, which he took by storm, as well as Dara, where he massacred the people; which so terrified the rest of the fortified towns that they all submitted. Mogheirah Ebn Saabali, another of Omar's generals, took Shiz, a town famed for the birth of Zerdusht,

the Persian philosopher, and overran the province of Adirbeizan. He also reduced Armenia, and penetrated into Cappadocia. Saad the same year took Athwas, the capital of Khuisistan, or Chusistan, the ancient Susiana, and reduced the whole province; while Al Nooman conquered the greatest part of Chorasán. But, while Omar's troops were thus overrunning the finest countries in the world, a period was put to his life and conquests by a Persian, named Abu Lulua, who stabbed him thrice in the belly, while performing his devotions at Medina, because Omar had refused to remit a tribute payable for the exercise of his religion. The Arabs rushed upon the assassin, but before they could get him overpowered he murdered seven of them. Omar languished three days, and died in the twelfth year of his reign.

After the murder of Omar, Othman Ebn Assan was chosen caliph; and Ali was still kept out of his right, though he had not only a better title, but was in fact the most virtuous and best character, and the bravest warrior of that period. Othman was inaugurated in the twenty-fourth year of the Hegira, or A. D. 645. He began his reign by sending Al Mogheirah to complete the conquest of Amadan; which he soon accomplished, and also reduced Bira, a strong fort of Mesopotamia. Another army, under Abdallah Ebn Amur, was sent into Persia to reduce the rest of Yezdegerd's dominions; which was done so completely that Yezdegerd was obliged to fly to Segestan, and leave Persia altogether. See PERSIA. In the twenty-seventh year of the Hegira Moawiyah reduced the islands of Cyprus and Aradus; and took Aneyra and Rhodes, where he broke in pieces the famous colossus, and sold the metal of it to a Jew of Edessa. Another of Othman's commanders entered Isauria, where he committed dreadful depredations, plundering the towns and villages, murdering many of the inhabitants, and carrying off 5000 prisoners. In the thirty-first year of the Hegira Hehib, entering that part of Armenia which was still unconquered, defeated a body of the imperial troops, pursuing them to Mount Caucasus, and laying waste the country; and Abul Abar, the admiral of the Saracens, defeated the emperor Constans by sea, on the coast of Lycia. This battle was so bloody that the sea was dyed with blood. But, while Othman's arms were thus successful abroad, a dangerous conspiracy was forming against him at home. The accusations against him were trifling and superstitious. To mention but one—he had presumed to sit on the top of Mahomet's pulpit, whereas Abu Beer had only sat on the highest step, while Omar was content with the lowest. Othman, however, to all these formidable accusations pleaded guilty, and promised amendment; but this only increased the insolence of the rebels. By the influence of Ali, however, tranquillity was apparently restored. But it was soon interrupted by Ayesha, one of Mahomet's widows, who, by a scheme of villany worthy of the widow of the grand impostor, accomplished the destruction of the caliph. Wishing to raise her favorite Telha to the caliphate, she prevailed on Merwan, the caliph's secretary, to write to the prefect of Egypt,

enjoining him to put to death Mahomet Ebn Abu Beer, with whom the letter was sent, and who was to have been his successor. This letter Merwan took care should be discovered, and Mahomet, taking it for genuine, published the caliph's cruelty all over these countries. He then marched with a body of rebels to Medina, and besieged the caliph in his palace; and, notwithstanding Othman's protestations of innocence, nothing but his death could satisfy the rebels. Othman applied to Ali for assistance, who sent his two sons Hassan and Husein, who defended the palace with great courage, till, water failing, they were obliged to abandon it; upon which the rebels entered and murdered the caliph, in the eighty-second year of his age, and twelfth of his reign. His body remained three days unburied, when it was thrown into a hole without any solemnity.

Mahomet's omission of naming a successor to the caliphate is totally unaccountable; and, as we have seen, threw the dignity out of his family during three successive reigns. His son-in-law Ali repeatedly claimed the succession, and doubtless had the best right, yet always peaceably submitted to the election of other persons. The Arabs, by their giving the preference to others, seem to have been influenced by no motive whatever but this republican idea, that it should not be established as a principle that the apostleship or caliphate should be reckoned an hereditary dignity. On the death of Othman, however, Ali's amiable qualities triumphed over all opposition, and he was unanimously elected. Besides his other popular qualities, he was a man of such unparalleled courage and strength, that he never declined a combat to which he was challenged, nor ever failed to come off victor; whence he was styled by the Arabs The lion of God. Great as Ali's merits were, however, he was not without his enemies. Among these Mahomet's widow, Ayesha, was the most conspicuous. At the time of Ali's inauguration she was at Mecca, where she possessed a considerable share of power. She very early began to plot against him, and Ali raised up against himself another very powerful enemy, by imprudently dismissing Moawiyah from his government of Syria, who, whatever malversations he was guilty of, should not have been displaced till Ali's government was more firmly established. The consequence was that Moawiyah was immediately proclaimed caliph by his troops, and thus the Saracens were divided into two factions; the one under Moawiyah and Ayesha, adhering to the house of Ommyia, to which Othman and Moawiyah belonged, the other to Ali. The former were called Motazalites, or Separatists; the latter Sephalites. Ali, finding a strong party forming against him, applied to the Koreish, to raise an army against Ayesha, who had begun hostilities and taken the city of Basra. Ziyad Ebn Hantelah, the Ansars, and a great number of people joined Ali. At Arrabah he was joined by many other parties; from Medina he got a large supply of horses, and from Cufa 8000 men. He then advanced to Basra, attacked and defeated the troops of Ayesha, and took the prophet's widow prisoner, though her troops were so zealous

in her defence, that seventy men had their hands cut off successively, who held her camel by the bridle. Ali, however, treated her very kindly, and at first set her at liberty, but afterwards confined her to her house at Medina, to prevent her from interfering farther in state affairs. After this victory Ali had no more enemies to contend with in Arabia, Egypt, Irak, Persia, or Chorasson. But a strong party of rebels still remained in Syria headed by Moawiyah, who was soon joined by Amru Ebn Al Ats. Ali, after in vain attempting to bring the rebels to an accommodation, entered Syria with 70,000 men, while that of Moawiyah amounted to 80,000. By reinforcements the former was increased to 90,000, and the latter to 120,000. The armies came within sight of each other in the end of the thirty-sixth year of the Hegira. The first month of the thirty-seventh was spent in fruitless negotiations; after which they fought in different parties, without hazarding a general engagement. These battles lasted about 110 days, during which Moawiyah lost 45,000 men and Ali 25,000. Among these was Ali's general of horse, Ammar Ebn Yazar, who was above ninety years old, and had been much esteemed by Mahomet, and was one of his companions. The loss of him so enraged Ali, that he challenged Moawiyah to fight him in single combat. This, however, the coward refused, though Amru urged him to accept. The battle was then renewed with great fury; Moawiyah's troops were pushed to their camp, which would certainly have been taken, had not Amru retrieved Moawiyah's affairs, when just on the brink of destruction, by a stratagem. He ordered some of his men to fix copies of the Koran to the points of their lances, and carry them to the front of the battle, crying out, 'This is the book that ought to decide all differences; this is the book of God, that prohibits the effusion of mussulmans blood.' Ali's troops on this threw down their arms, and thus was decisive victory wrested from him when almost gained. The two parties then agreed to choose each his arbitrator. Moawiyah chose Amru, but Ali was again shuffled out of his right, the troops of Irak naming for him Abu Musa, a man who had already betrayed him. The consequence was that Ali was deposed; to which sentence he submitted, but without laying down his arms. After this Ali retired to Cufa, where 12,000 of his troops, called Kharejites, pretending to be offended with the step he had taken, revolted. They insisted that he ought not to keep the peace with Moawiyah, but pursue him without mercy. But Ali replied that, as he had given his word, he must keep it. They then chose Abdallah Ebn Waheb their general, who appointed for their rendezvous Naharwan, a town between Waset and Bagdad, four miles east of the Tigris, where they collected an army of 25,000 men. Ali at last marched against them, but previously proclaimed quarter and pardon to all who should return to his standard. This measure soon reduced Abdallah's troops to 4000 men, with whom he rushed upon Ali's forces, who cut them all to pieces except nine. Had Ali marched immediately against Moawiyah, he had probably reduced him entirely; but he seems to have considered the agreement as binding,

and therefore acted only on the defensive. At last the Kharejites, wishing to get rid of Moawiyah, Amru, and Ali, sent assassins to murder all the three. Moawiyah was wounded, but recovered; Amru's secretary was killed by mistake; but Ali was wounded with a poisoned sword, which proved mortal. The assassin was taken, and would have been pardoned had Ali recovered; but he ordered him to be put to death if he died, 'that he might accuse him before God.' Even in this, however, Ali showed him clemency, by ordering him to be killed at one blow, without torture. Thus fell Ali, the most virtuous of all the caliphs, after he had reigned nearly five years, and lived sixty-three.

Hassan the son of Ali, who inherited all his father's virtues except his courage, was declared caliph immediately upon Ali's death. Moawiyah soon showed his hostile intentions, and Hassan's friends pressed him to declare war immediately; but, though they prevailed with him to take the field, his disposition was too mild and peaceable: and he himself, sensible of his incapacity to dispute the empire with Moawiyah, in spite of the remonstrances of his friends, resigned it to that villain; who some years after caused him to be poisoned by his own wife. Moawiyah, now sole master of the empire, resolved to reduce the Kharejites, who were still rebellious. In this service he offered Hassan the command of the army, but that prince declined it. He then sent the Syrian troops against them, but they were defeated. At last the Cufans were employed, who quickly put an end to the rebellion. In the forty-eighth year of the Hegira the caliph sent his son Yazid, with a powerful army, to besiege Constantinople. In this expedition he was accompanied by three or four of those associates of Mahomet whom he had dignified with the title of his companions, who, notwithstanding their great age, were prompted by zeal to undergo incredible fatigues. But, in spite of the zeal of these veterans, the expedition proved unsuccessful; and in it one of them, viz. Abu Ayub, who had been with Mahomet at the battles of Bedr and Ohod, lost his life. His tomb is still held in the highest veneration by all Mussulmans. In the fifty-fourth year of the Hegira the Saracens made an irruption into Bukharia, and defeated the Turkish army, killing great numbers of them. About this time a treaty was concluded between the emperor Constantine IV. and the Saracens, whereby the latter were allowed to keep the territories they had seized, but bound to pay 3000 lbs. of gold annually, fifty slaves, and fifty good horses. This treaty was to last thirty years. In the fifty-fifth year of the Hegira, Moawiyah conferred the government of Chorasán upon Saad, Othman's grandson, who soon after passed the Jihun, or Amu (the ancient Oxus), and advanced with a body of troops to Samarcand, which instantly surrendered to him; soon after which he defeated an army of Usbeck Tartars, and marched directly to Tarmud, which also surrendered. The fifty-seventh year of the hegira was remarkable for nothing but vast swarms of locusts which did incredible damage in Syria and Mesopotamia. In the fifty-eighth Ayesha, Ma-

homet's widow died, and in the sixtieth Moawiyah himself, after having reigned from Hassan's resignation, nineteen years five months and five days. He was interred at Damascus.

On Moawiyah's death his son Yazid was immediately proclaimed, April 7th, 680. He wrote to Al Walid, the governor of Medina, to seize Husein, the remaining son of Ali, and Abdallah Ebn Zobeir, if they refused to acknowledge his right; but they escaped to Mecca; on which Jediz displaced Al Walid, and appointed Amru Ebn Saad governor in his stead. Amru immediately sent against Abdallah his own brother Amer, who mortally hated him; but Abdallah engaged and took him prisoner, which raised his fame at Medina. Mean time Husein, as the only heir of Ali, became very popular at Mecca, Medina, Irak, and Cufa; and the Cufans even raised an army of 18,000 men in his favor; and promised to raise 120,000 more; but all Husein's hopes were soon frustrated, and himself killed in an engagement with Obeidallah. Yazid did himself honor by treating Husein's family with kindness. In the sixty-first year of the Hegira Yazid appointed Salem Ebn Ziyad governor of Chorasán, who soon after made an irruption into the Turkish territories. He sent a body of troops to Khowarazm, the capital of the Tartars, from which he extorted 50,000,000 of money: whence advancing to Samarcand, he compelled the people of that city also to pay him an immense sum. Meantime Abdallah Ebn Zobeir, being, by the death of Husein, at the head of the house of Hashem, began to aspire to the caliphate, and was proclaimed caliph at Medina, on the arrival of Husein's family. He then expatiated on Husein's tragical death, and accused the Cufans of being the most perfidious villains on earth. This pleased the citizens of Mecca and Medina, who flocked to him in crowds, so that he soon had a great army. Yazid, hearing of all this, swore he would have him in chains, and sent a silver collar for him to Merwan, governor of Medina. At last the people of Medina renounced their allegiance to Yazid, and formally deposed him in a whimsical but expressive manner, throwing aside their turbans, shoes, &c., and saying, 'I lay aside Yazid as I do this turban, or shoe,' &c. They then banished Yazid's governor, and all his friends, who, to the number of 1000, took refuge in the house of Merwan Ebn Al Haken, where, being besieged by Abdallah's party, they sent to Yazid for assistance, who detached a body of troops under Moslem Ebn Okba to Medina for that purpose. The people of Medina, on this, allowed Yazid's friends to withdraw; but Moslem advanced at the head of 5000 foot and 12,000 horse, and summoned the town to surrender; which being refused, the garrison made a vigorous defence, but, the principal officers being killed, the city was taken by storm; all the men who had borne arms were massacred, the women ravished, and the city pillaged. Ali alone, the son of Husein, was treated with respect. By this severity Moslem incurred the anathema pronounced by Mahomet against those who should pillage Medina. After this Moslem proceeded to Mecca, where Abdallah had retired; but he died by the road, and the command devolved

upon Hosein Ebn Thamiir, who advanced to Mecca and besieged it forty days, battering it with such fury that he beat down its famous temple; and it must soon have shared the fate of Medina had not the news of Yezid's death stopped further operations. Yezid died in his thirty-ninth year, the sixty-second of the Hegira, or A. D. 684, having reigned only three years and eight months.

Yezid was succeeded by his son Moawiyah II., who was proclaimed caliph at Damascus on his father's death; but, being of a weak constitution, he resigned the crown in six weeks, and died soon after. Great commotions followed. Obeidallah was become so unpopular by his cruelties, particularly by the death of Hosein, that he was obliged to fly into Syria; on which his house was plundered by the mob. In this confusion Abdallah might have easily secured the caliphate, had he not, with equal imprudence and cruelty, ordered the house of Ommiyah to be exterminated. This ruined his affairs; for they being obliged to fly for safety, Merwan was proclaimed caliph at Damascus, and thus the Saracen empire was once more rent into two factions. A battle soon ensued between Dahak Ebn Kais, who favored Abdallah, and the troops of Merwan, in which Dahak was defeated and killed, and thus Merwan became master of Syria. Soon after he advanced with a body of troops to Egypt, but sent before him Amru Ebn Said with a detachment, who defeated Abdalrahman, Abdallah's lieutenant, in several brisk actions, till he at last surrendered the whole country to Merwan, for a sum of money, and retired to Hedsjaz. The Syrian troops immediately took possession of the country; and Merwan, having appointed his son Abdalazziz over Egypt, returned to Damascus. He then sent Amru Abn Said against Musab, Abdallah's brother, whom he totally defeated. In the sixty-fifth year of the Hegira the Cufans, pretending remorse for their treachery to Hosein, raised an insurrection against both caliphs, and assembled 16,000 men under Soliman to avenge the death of Hosein. Al Mokhtar, who had served under Abdallah, offered to serve instead of Soliman, who he said was incapable of executing the enterprise. This being refused, he drew off 2000 from Soliman, while other 10,000 left him. So enthusiastic, however, was Soliman in the affair, that he set forward to Syria with the remaining 4000, who were all cut to pieces by Obeidallah, who was at the head of 20,000. Soon after this died the caliph Merwan, after a short reign of eleven months, being poisoned by Seinab, Moawiyah's widow, whom he had married.

Merwan was succeeded by his son Abdalmalec, who released Al Mokhtar, who had been imprisoned by the governor of Cufa. Al Mokhtar soon after hearing that Abdallah had imprisoned the whole descendants of the celebrated caliph Ali, and was going to put them to death, sent a body of 750 horse to Mecca under Abu Abdalla for their relief, which they accomplished, and took Abdallah himself prisoner, two days before they were all to have been murdered. After this they settled on a mountain near Mecca with a body of 4000 men. Al Mokhtar next attacked

and killed Obeidallah; but was soon after defeated and slain by Musab, and all his men to the number of 7000, though they surrendered at discretion, were also slain for their former outrages. Next year, the sixty-eighth of the Hegira, the Azarakites made an irruption into Irak, penetrating to Cufa and Al Madayen, and committing the most horrid cruelties, murdering all they met with, and sparing neither age nor sex. The governor of Mesopotamia carried on a war with them for eight months. Musab sent against them Omar Ebn Abdallah, who gave them a great overthrow, slaughtered great numbers of them, and pursued the rest as far as Ispahan and Kerman. Returning a second time Omar totally defeated and dispersed them. In the sixty-ninth year of the Hegira Abdalmalec marched against Musab. In his absence he left Amru Ebn Said governor of the city, who immediately seized it for himself; on which Abdalmalec returned. After some skirmishes between the caliph's troops and those of Amru, a treaty was agreed upon; which Abdalmalec broke immediately after by murdering Amru with his own hand. Upon this Yahyah, Amru's brother, at the head of 1000 slaves, attacked the palace and killed the guards, but were quelled afterwards, partly by money. In the seventieth year of the Hegira the Greeks made an irruption into Syria; and the caliph was obliged to pay a tribute of 1000 dinars per day, and sent annually 365 slaves and 365 horses to Constantinople. The revenues of Cyprus, Armenia, and Heria, were agreed to be divided. Abdalmalec next marched against Musab, whom he defeated and killed through the treachery of his troops. The caliph went to Cufa, where all ranks submitted and swore to him. He then ordered money to be distributed among the people, and gave a splendid entertainment to all his new subjects, from which even the meanest were not excluded. During this entertainment Musab's head was presented to the caliph; on which one of the company said, 'I saw Hosein's head in this same castle presented to Obeidallah; Obeidallah's to Al Mokhtar; Al Mokhtar's to Musab; and now at last Musab's to yourself.' The caliph was so struck with this remark, that, to divert the ill omen, he ordered the castle to be instantly demolished. Abdallah Ebn Zobier, hearing of the defeat and death of his brother, put Mecca in a proper state of defence. Abdalmalec, on his return from Damascus, appointed his brother Bashir governor of Cufa, and Khaled Ebn Abdallah governor of Basra; who imprudently displaced Al Mohalleb, one of the greatest generals of the age, from the command of the army, and put in his place Abdalaziz, a man much inferior. The barbarous Azarakites no sooner heard of this than they attacked Abdalaziz, entirely defeated, and took his wife prisoner. A dispute arising among them about the price of the lady, one of them, to end it, cut off her head. On this disaster Khaled was ordered to replace Al Mohalleb, which he no sooner did than they in conjunction attacked the Azarakites, forced their camp, and completely defeated them. In the seventy-second year of the Hegira Abdalmalec prepared to invade Hedsjaz, and appointed Al Hejjaj, one of his bravest ge-

nerals, commander. After several skirmishes, wherein Abdallah's troops had the worst, most of Abdallah's friends, two of his sons, and 10,000 inhabitants of Mecca, deserted him. In this extremity he consulted with his mother, whether he should submit to the caliph or not; but she, being a high-spirited woman, the daughter of Abu Beer, the second caliph, advised him against it; whereupon, in a fit of despair, he plunged into the midst of his enemies without his usual coat of mail, and, after slaughtering great numbers of them, was killed. Al Hejaj cut off his head and fixed his body to a cross; which had a strong odor of musk for several days after, his mother having given him a draught in which a pound of musk was infused, to inspire him with courage. By the reduction of Mecca Abdalmalec was now sole master of the empire, but he suffered a great loss the next year, having an army of 100,000 men cut off by the Khazarians in Armenia. The governor, however, marched against them soon after at the head of 40,000 chosen troops, penetrated into the heart of Armenia, defeated a large body of them, and drove them into their temples, to which he set fire. One of his generals also defeated 80,000 Khazarians at the Caspian gates, killed a great number of them, and compelled the rest to turn Mahometans. Al Hejaj, for his services, was made governor of Medina, and then of Irak, Chorasán, and Sejestan, in all which places he behaved with the greatest cruelty, and yet he was continued in these governments till he died. In the seventy-sixth year of the Hegira Saleh Ebn Marj, and Shebib Ebn Seid, a Kharejite, rebelled against the caliph. Saleh proclaimed emperor of the faithful at Daras in Mesopotamia. At first they were successful, and defeated even Al Hejaj himself; but at last were defeated and killed, and their troops slaughtered and dispersed. In the seventy-sixth year of the Hegira Abdalmalec erected the first mint in Arabia, and struck gold and silver coins. Before this period their dinars or gold coins had Greek inscriptions, and their dirhems or silver coins Persian. The caliph now struck dirhems with the Arabic words, Alla Samad, i. e. God is eternal, upon them; which offended some superstitious Muslims, who thought the name of God would thus be profaned by the touch of the unclean. In the seventy-seventh year of the Hegira, the Saracens made an incursion into the imperial territories, when Lazica and Bernucium were betrayed to them. In the seventy-eighth they over-ran Africa Proper, and demolished the city of Carthage. They were driven out by John the Patriarch, but, returning with a superior force, they made John fly to Constantinople. In the year seventy-nine Abdalrahman rebelled in Persia; and drove the khan or emperor of the Turks, Tartars, and Moguls, out of that country; but in eighty, Heraclius, the Greek general, penetrated into Syria, as far as Samosata, killed 200,000 Saracens, and ravaged the country dreadfully. At last, after about eighty battles, or as some say 100, Abdalrahman was defeated and killed by Al Hejaj. In the eighty-third year of the Hegira the Armenian nobility revolting, drove the Arabs out of that province; but Mahomet, a general

of the caliph's, entering it with a powerful army, got the authors of the revolt into his hands, and caused them to be burnt alive. The Saracens then invaded Cilicia, under one Azar, but were, to the number of 10,000 the one year, and 12,000 the next, cut in pieces by Hlerachus, and the rest forced to fly. In the year eighty-six Abdalmalec died, after a reign of twenty-one years.

Abdalmalec was succeeded by his son Al Walid, who greatly extended the Saracen empire. In the first year of his reign one of his generals passed the Jihun, and defeated a numerous army of Turks and Tartars. He then over-ran and reduced Sogdiana, Bagrass, Shash, Targana, and the whole immense tract called Mawarahnahar, or Great Bukharia. He also conquered the khan of Khowarazm, and forced him to pay an annual tribute of 2,000,000 of dinars. Another of his generals, called Mahomet, made an irruption into India, and conquered a great part of that country. He also subdued the kingdom of Al Sind, between Persia and India; when Derar the king of it was defeated and killed, and had his head cut off by Mahomet. In the ninetieth year of the Hegira the Saracens made an irruption into Cappadocia, defeated the imperial army, and took the city of Tyana. In the two following years they repeated their incursions under Othman, took several cities, and carried off numbers of slaves. In the year ninety-three, or A. D. 712, Tarek Ebn Zarka, made a descent on Spain, defeated Roderick, the last king of the Goths, reduced Toledo, and over-ran a great part of the kingdom. Being joined by Musa, commander of the African Moslems, they took most of the forts and subdued the whole country. In these expeditions they acquired immense spoils, particularly a very rich table, called Solomon's table, of gold, silver, and pearls, and standing on 365 feet. In ninety-four Tarick landed a body of 12,000 men at Gibraltar, with which he plundered Hispania Bætica, and great part of Lusitania. Roderick's troops being new raised were unable to resist these hardy invaders. Another Saracen general entered Pisidia, ravaged the country, and took Antioch. In the year ninety-five Hejaj died, after a cruel government of twenty years; during which period he killed 120,000 men, and suffered 50,000 men and 30,000 women to perish in prisons. This year also the Saracens completely defeated Roderick king of the Goths, who was killed in the battle; and Tarif amassed immense riches. In the east these plunderers were equally successful. Moslema ravaged the whole province of Galatia, carrying off rich spoils, and many prisoners. But, while Al Walid was preparing to invade Constantinople, he died in the sixty-ninth year of the Hegira.

The caliph Al Walid was succeeded by his brother Soliman. This year the Saracen conquests on the east side were increased by the reduction of Tabrestan and Jurgon or Georgia. In Spain also the city of Toledo, which had revolted, was reduced, and Cæsar-Augusta, now Saragossa, as well as several others. The next year Moslema set out for Constantinople, which he besieged without success till the ninety-ninth year of the Hegira; when he was obliged to re-

turn, after having lost before it 120,000 men. The soldiers were reduced to the greatest extremities of hunger, being forced to live upon hides, the roots and bark of trees, the most noisome animals, and even the dead bodies of their companions. This year also (the ninety-ninth) the caliph Soliman died. According to some, he was poisoned by Yezid his brother, governor of Persia, who was displeased with his having appointed his cousin-german Omar Ebn Abdalaziz as his successor, to the exclusion of himself. According to others, he died of an indigestion; which is not to be wondered at, if, as those authors say, he used to devour 100lbs. of meat every day, and dine very heartily after eating three lambs roasted for breakfast. In the latter part of his reign, the Moors were by no means successful in Spain; the kingdom of Navarre being founded at this time by Pelagius, or Pelayo, whom the Arabs were never able to reduce. The new caliph Omar Ebn Abdalaziz was by no means of a martial character; but is said to have been very pious, and possessed of very amiable qualities. He suppressed the usual malediction, which was solemnly pronounced by the caliphs of the house of Ommyyah against the house of Ali; and always showed great kindness to the latter. He was poisoned by Yezid, after a short reign of two years and five months. Concerning Yezid II., the successor of Omar, we find very little worth mentioning. He did not long enjoy the dignity he had so iniquitously purchased, dying after a reign of about four years. He died of grief for a favorite concubine named Hababah, who was accidentally choked by a large grape which stuck in her throat. Yezid was succeeded by his brother Hesham, who ascended the throne in the 105th year of the Hegira. In the second and third years of his reign several incursions were made into the imperial territories, but generally without success. In the 109th year Moslema drove the Turks out of Armenia and Adirbeitzan, and again confined them within the Caspian gates. The next year he obliged them to take an oath that they would keep their own country; but this they soon violated, and were again driven back by Moslema. About this time also the Arabs, having passed the Pyrenees, invaded France to the number of 400,000, including women and slaves, under the command of one Abdalrahman. Having advanced to Arles, upon the Rhone, they defeated a large body of French that opposed them: and, having also defeated count Eudo, they pursued him through several provinces, wasted the country with fire and sword, and took the city of Tours, most of which they reduced to ashes. Here, however, a stop was put to their devastations by Charles Martel; who, coming up with them near Tours, engaged them for seven days together, and at last gave them a total overthrow. He took all their baggage and riches; and Abdalrahman, with the shattered remains of his army, reached the frontiers of Spain with difficulty. The following year also the Arabs were overthrown at Illiberis, scarcely any of them escaping. To make amends for this bad fortune, however, the caliph's arms were successful against the Turks, who had again invaded some of the

eastern provinces. In the 125th year of the Hegira died the caliph Hesham, after a reign of nineteen years seven months and eleven days. He was succeeded by Al Walid II., who is represented as a man of a most dissolute life, and was assassinated the following year on account of his professing Zendicism, a species of infidelity nearly resembling Sadducæism.

Al Walid II. was succeeded by Yezid III., the son of Al Walid I., who died of the plague after a reign of six months; and was succeeded by Ibrahim Ebn Al Walid, an imprudent and stupid prince. He was deposed in the 127th year of the Hegira by Merwan Ebn Mahomet, the governor of Mesopotamia; who gave out, as an excuse for his revolt, that he intended to revenge the murder of the caliph Al Walid II. He was no sooner seated on the throne, than the people of Hems rebelled against him. Against them the caliph marched with a powerful army, and summoned them to surrender. They assured him that they would admit him into their city; and, accordingly, one of the gates being opened, Merwan entered with about 300 of his troops. The men that entered with him were immediately put to the sword; and the caliph himself escaped with great difficulty. However, he afterwards defeated them in a pitched battle, put a great number of them to the sword, dismantled the city, and crucified 600 of the principal authors of the revolt. The inhabitants of Damascus soon followed the example of those of Hems, and deposed the caliph's governor; but Merwan marched to Damascus with great celerity, entered the city by force, and punished the authors of the revolt. Peace, however, was no sooner established at Damascus, than Soliman Ebn Hesham set up for himself at Basra, where he was proclaimed caliph by the inhabitants. Here he assembled an army of 10,000 men, with whom he marched to Kinnissin, where he was joined by vast numbers of Syrians. Merwan, receiving advice of Soliman's rapid progress, marched against him with all the forces he could assemble, and entirely defeated him. In this battle Soliman lost 30,000 men, so that he was obliged to fly to Hems, where 900 men took an oath to stand by him to the last. Having ventured, however, to attack the caliph's forces a second time, he was defeated, and again forced to fly to Hems. But, being closely pursued by Merwan, he constituted his brother Said governor of the city, leaving with him the shattered remains of his troops, and himself fled to Tadmor. Soon after his departure Merwan appeared before the town, which he besieged for seven months; during which time he battered it incessantly with eighty catapults. The citizens, being reduced to the last extremity, surrendered, and delivered Said into the caliph's hands. In consideration of this submission, Merwan pardoned the rebels, and took them all under his protection. About the same time, another pretender to the caliphate appeared at Cufa; but Merwan took his measures so well that he extinguished this rebellion before it could come to any height. Notwithstanding the success, however, that had hitherto attended Merwan, a strong party was formed against him in Khorasan by the house of

Al Abbas. The first of that house that made any considerable figure was named Mahomet, who flourished in the reign of Omar Ebn Abdalaziz. He was appointed chief of the house of Al Abbas, about the 100th year of the Hegira; and is said to have prophesied, that after his death, one of his sons named Ibrahim should preside over them till he was killed, and that his other son Abdallah, surnamed Abul Abbas Al Saffah, should be caliph, and exterminate the house of Ommyyah. Upon this Al Saffah was introduced as the future sovereign, and those present kissed his hands and feet. After the decease of Mahomet, his son Ibrahim nominated as his representative in Khorasan one Abu Moslem, a youth of nineteen years of age; who beginning to raise forces in that province, Merwan despatched against him a body of horse under Nasr Ebn Sayer; but that general was entirely defeated by Abu Moslem, and the greatest part of his men killed. The next year (the 128th of the Hegira) Merwan made vast preparations to oppose Abu Moslem, who after the late victory began to grow formidable. Merwan gained two victories over some of Ibrahim's generals; but, the year following, Abu Moslem brought such a formidable army into the field that the caliph's troops could not make head against them; his officers in Khorasan therefore were obliged either to take an oath of allegiance to Ibrahim, or to quit the province within a limited time. In the 130th year of the Hegira the caliph's general Nasr, having drawn together another army, was again defeated by Kahatabah, another of Ibrahim's generals, and forced to fly to Raya, a town of Dylam, or of Khorasan. The next year Ibrahim, having foolishly taken it into his head to go on a pilgrimage to Mecca, attended by a numerous retinue splendidly accoutred, was seized and put to death by Merwan: and the year following Abul Abbas was proclaimed caliph at Cufa. As soon as the ceremony was ended, he sent his uncle Abdallah with a powerful army to attack Merwan's forces that were encamped near Tubar, at a small distance from Mosul, where that caliph was then waiting for an account of the success of his troops under Yezid governor of Irak against Khataba, one of Al Saffah's generals. Khataba, receiving advice of Yezid's approach, immediately advanced against him, and entirely defeated him; but in crossing the Euphrates, the waters of which were greatly swelled, he was carried away by the current and drowned. The pursuit, however, was continued by his son Hamid, who dispersed the fugitives in such a manner that they could never afterwards be rallied. At the news of this disaster, Merwan was at first greatly dispirited; but, soon recovering himself, he advanced to meet Abdallah. In the beginning of the battle, the caliph happened to dismount; and his troop perceiving their sovereign's horse without his rider, concluded that he was killed, and therefore immediately fled; nor was it in the power of the caliph himself to rally them again, so that he was forced to fly to Damascus; but the inhabitants of that city, seeing his condition desperate, shut their gates against him. Upon this he fled to Egypt, where he maintained himself for some time; but was at last attacked

and killed by Saleh, Abdallah's brother, in a town of Thebais called Busir Kurides. The citizens of Damascus, though they had shamefully deserted Merwan, refused to open their gates to the victors; upon which Saleh entered the city by force, and gave it up to be plundered for three days by his soldiers.

By the total defeat and death of Merwan, Al Saffah remained sole master of the Saracen throne; but no very remarkable events happened during his reign; only he massacred great numbers of the partisans of the house of Ommyyah; and Constantine Copronymus, taking advantage of the intestine divisions among the Saracens, ravaged Syria. The caliph died of the small pox in the 136th year of the Hegira, in the thirty-third year of his age; and was succeeded by his brother Al Mansur. In the beginning of Al Mansur's reign hostilities continued against the house of Ommyyah, who still made resistance, but were always defeated. Abdallah, however, the caliph's uncle, caused himself to be proclaimed caliph at Damascus; and having assembled a powerful army in Arabia, Syria, and Mesopotamia, advanced with great expedition to the banks of the Masius near Nisibis, where he encamped. Al Mansur, being informed of this rebellion, despatched Abu Moslem against Abdallah. This general, having harassed him for five months together, at last brought him to a general action; and, having entirely defeated him, forced him to fly to Basra. Notwithstanding all his services, however, Abu Moslem was soon after ungratefully and barbarously murdered by Al Mansur, on some ridiculous pretences of being deficient in respect towards him. After the death of Abu Moslem, one Sinan, a Magian, or adorer of fire, having made himself master of that general's treasures, revolted against the caliph; but he was soon defeated by Jamhur Ebn Morad, who had been sent against him with a powerful army. In this expedition Jamhur having acquired immense riches, the covetous disposition of the caliph prompted him to send a person express to the army to seize upon all the wealth. This so provoked Jamhur that he immediately turned his arms against his master; but was soon defeated, and entirely reduced. The following year (the 139th of the Hegira) one Abdalrahman, of the house of Ommyyah, after the entire ruin of that family in Asia, arrived in Spain, where he was acknowledged caliph; nor did he or his descendants ever afterwards own subjection to the Arabian caliphs. The 140th year of the Hegira is remarkable for an attempt to assassinate the caliph. This attempt was made by the Rawandians; an impious sect, who held the doctrine of metempsychosis or transmigration. They first offered Al Mansur divine honors, by going in procession round his palace, as the Moslems were wont to do round the Caab; but the caliph, highly incensed at this impiety, ordered 100 of the principal of them to be imprisoned. These, however, were soon released by their companions; who then went in a body to the palace with an intention to murder their sovereign; but he being a person of uncommon bravery, though he was surprised with very few attendants, mounted a mule, and ad-

vanced towards the mutineers with an intention to sell his life as dearly as possible. In the mean time, Maan Ebn Zaidat, one of the chiefs of the Ommyan faction, who had concealed himself to avoid the caliph's resentment, sallied out of his retreat, and, putting himself at the head of Al Mansur's attendants, charged the rebels with such fury that he entirely defeated them. This generosity of Maan was so remarkable that it afterwards passed into a proverb. On this occasion 6000 of the Rawandians were killed on the spot, and the caliph delivered from instant death; he was, however, so much disgusted with the Arabs, on account of this attempt, that he resolved to remove the capital of his empire out of their peninsula; and accordingly founded a new city on the banks of the Tigris, named Bagdad. The foundations of it were laid in the 158th year of the Hegira, and finished four years after. On the removal of the seat of government to Bagdad, the peninsula of the Arabs seems all at once to have lost its consequence, and in a short time the inhabitants seem even to have detached themselves from the jurisdiction of the caliphs; for in the 156th year of the Hegira, while Al Mansur was yet living, they made irruptions into Syria and Mesopotamia, as if they had designed to conquer these countries over again for themselves; and though the Arabs, properly so called, continued nominally subject to the caliphs of Bagdad till the abolition of the caliphate by Hulaku the Tartar, yet they did not become subject to him when he became master of that city.

From the building of the city of Bagdad to the death of Al Mansur nothing very remarkable happened, excepting some irruptions made into the territories of the Greeks, and by the Arabs into some of the caliph's other territories. In the 157th year of the Hegira, also, a grievous famine was felt in Mesopotamia, which was quickly after followed by a plague that destroyed great numbers. This year likewise, the Christians, who had been all along very severely dealt with by Al Mansur, were treated with the utmost rigor by Musa Ebn Mosaab the caliph's governor; every one who was unable to pay the enormous tribute exacted of them being thrown into prison. In the 158th year of the Hegira, the caliph set out from Bagdad to perform the pilgrimage to Mecca; but, being taken ill on the road, he expired at Bir Maimun, whence his body was carried to Mecca; where, after 100 graves had been dug, that his sepulchre might be concealed, he was interred, having lived, according to some, sixty-three, according to others, sixty-eight years, and reigned twenty-two. He was extremely covetous, and left in his treasury 600,000,000 dirhems, and 24,000,000 dinars. He is reported to have paid his cook by assigning him the heads and legs of the animals dressed in his kitchen, and to have obliged him to procure at his own expense all the fuel and vessels he had occasion for. When Al Mansur expired at Bir Maimun, he had only his domestics and Rabi his freed man with him. The latter, for some time, kept his death concealed, and pretended to have a conference with him; in which, as he gave out, the caliph commanded him to exact an oath of allegiance to Al Mohdi his son, as his

immediate successor, and to Isa Ebn Musa his cousin german, as the next apparent heir to the crown. He then despatched a courier to Bagdad with the news of Al Mansur's death: upon which Al Mohni was unanimously proclaimed caliph. Isa Ebn Musa, however, no sooner heard this news than he began to entertain thoughts of setting up for himself at Cufa, where he then resided; and, to facilitate the execution of his scheme, fortified himself in that city. But Al Mohdi, being apprized of his defection, sent a detachment of 1000 horse to bring him to Bagdad; which being done, Al Mohni not only prevailed upon him to own his allegiance to him, but also to give up his right to the succession for 10,000 according to some, or according to others for 10,000,000 dinars. From the accession of Al Mohdi to the 164th year of the Hegira, the most remarkable event was the rebellion of Al Mokanna. This impious impostor, whose true name was Hakem Ebn Hesham, came originally from Khorasan, and had been an under secretary to Abu Moslem governor of that province. He afterwards turned soldier, and passed from the province of Khorasan into that of Mawaralnahr, where he gave himself out for a prophet. The name of Al Mokanna, as also that of Al Borkai, that is, the veiled, he took from his custom of covering his face with a veil or girdle mask, to conceal his deformity; he having lost an eye in the wars, and being otherwise of a despicable appearance. In some places he made many proselytes, including the people with a number of juggling tricks which they swallowed as miracles, and particularly by causing the appearance of a moon to rise out of a well for many nights together; whence he was also called in the Persian tongue Sazendeb mak, or the moon-maker. This wretch, not content with being reckoned a prophet, arrogated to himself divine honors; pretending that the Deity resided in his person. At last this impostor raised an open rebellion against the caliph, and made himself master of several fortified places in Khorasan, so that Al Mohdi was obliged to send one of his generals with an army against him. Upon the approach of the caliph's troops, Al Mokanna retired into one of his strong fortresses, which he had well provided for a siege; and sent his emissaries abroad to persuade the people that he raised the dead to life, and foretold future events. But being closely besieged by the caliph's forces, and seeing no possibility of escaping, he gave poison in wine to his whole family, and burnt their bodies, with all their furniture, provisions, and cattle; and, lastly, he threw himself into the flames, or, as others say, into a tub of aquafortis, or some other preparation, which consumed every part of him except the hair. When the besiegers therefore entered the place, they found no living creature in it, except one of Al Mokanna's concubines, who, suspecting his design, had hid herself, and now discovered the whole. This terrible contrivance, however, produced the desired effect. He had promised his followers that his soul should transmigrate into the form of an old man riding on a grayish colored beast, and that after so many years he would return and

give them the earth for their possession; which ridiculous expectation kept the sect in being for several years. All this time war had been carried on with the Greeks, but without any remarkable success on either side. In the 164th year of the Hegira, however, Al Mohdi ordered his son Harun Alrashedid to penetrate into the Greek territories with an army of 95,000 men. Harun, then, having entered the dominions of the empress Irene, defeated one of her commanders that advanced against him; after which he laid waste several of the imperial provinces with fire and sword, and even threatened Constantinople itself. By this the empress was so terrified that she purchased a peace with the caliph by paying him an annual tribute of 70,000 pieces of gold; which delivered her from the depredations of these barbarians. After the signing of the treaty, Harun returned home laden with spoils and glory. In the 169th year of the Hegira, Al Mohdi was poisoned, though undesignedly, by one of his concubines, named Hasanah. She had designed to destroy one of her rivals whom she imagined to have too great an ascendant over the caliph, by giving her a poisoned pear. This latter, not suspecting any thing, gave to the caliph; who had no sooner eaten it than he felt himself in an exquisite torture, and soon after expired.

On the death of Al Mohdi, he was succeeded by his eldest son Al Hadi; who having formed a design to deprive his younger brother Harun Alrashedid of his right of succession, and even to assassinate him, was poisoned by his vizier in the 170th year of the Hegira; and on his death the celebrated caliph Harun Alrashedid ascended the throne. This was the best and wisest prince that ever sat on the throne of Bagdad. He was also extremely fortunate in all his undertakings, though he did not much extend his dominions by conquest. In his time the Saracen empire may be said to have been in its most flourishing state, though, by the independency of the Saracens in Spain, who had formerly set up a caliph of the house of Ommyyah, his territories were not quite so extensive as those of some of his predecessors. See BAGDAD. The first instance of Harun's good fortune, and which was taken for a presage of a prosperous and happy reign, was his finding a valuable ring which he had thrown into the Tigris to avoid being deprived of it by his brother Al Hadi. He was able to give the divers no other direction than by throwing a stone from the bridge of Bagdad, about the same place of the river in which he had thrown the ring; notwithstanding which they found it without any great difficulty. In the 186th year of the Hegira, or A. D. 802, the caliph divided the government of his extensive dominions among his three sons: to Al Amin the eldest he assigned Syria, Irak, the three Arabias, Mesopotamia, Assyria, Media, Palestine, Egypt, and all that part of Africa extending from the confines of Egypt and Ethiopia to the straits of Gibraltar, with the dignity of caliph; to Al Mamun, the second, he assigned Persia, Kerman, the Indies, Khorasan, Tabrestan, Cabestan and Zablestan, with the vast province of Mawarahnahr; and to his third son, Al Kasem, he gave Armenia, Na-

tolia, Jorjan, Georgia, Circassia, and all the Saracen territories bordering upon the Euxine Sea. Al Amin was to ascend the throne immediately after his father's decease; after him Al Mamun, and then Al Kasem, whom he had surnamed Al Mutaman. The most considerable exploits performed by this caliph were against the Greeks, who by their perfidy provoked him to make war upon them, and whom he always overcame. In the 187th year of the Hegira the caliph received a letter from the Greek emperor Nicephorus, soon after he had been advanced to the imperial dignity, commanding him to return all the money he had extorted from the empress Irene, though that had been secured to him by the last treaty concluded with that princess, or expect soon to see an imperial army in the heart of his territories. This insolent letter so exasperated Harun that he immediately assembled his forces, and advanced to Heraclea, laying the country through which he passed waste with fire and sword. For some time also he kept that city straitly besieged; which so terrified the Greek emperor that he submitted to pay an annual tribute. Upon this Harun granted him a peace, which he broke soon after; but Harun compelled him to renew it, and then returned with his army. In the 188th year of the Hegira war was renewed with the Greeks; and Nicephorus with a great army attacked the caliph's forces with the utmost fury. He was, however, defeated with the loss of 40,000 men, and received three wounds in the action; after which the Saracens committed terrible ravages in his territories, and returned home laden with spoils. The next year Harun invaded Phrygia, defeated an imperial army sent to oppose him, and ravaged the country. In the 190th year of the Hegira, November 27th, 805, the caliph marched into the imperial territories with an army of 135,000 men, besides a great number of volunteers. He first took the city of Heraclea, whence he carried 16,000 prisoners; after which he took several other places, and made a descent on Cyprus, which he plundered in a terrible manner. This so intimidated Nicephorus that he immediately sent the tribute due to Harun, the withholding of which had been the cause of the war, and concluded a peace upon the caliph's own terms; one of which was that the city of Heraclea should never be rebuilt. This perhaps Harun would not so readily have granted, had not one Rafe Ebn Al Leith revolted against him at Samarcand, and assembled a considerable force. In the 191st year of the Hegira, the caliph removed the governor of Khorasan from his employment, because he had not attended to the motions of the rebel Rafe. As this governor had also tyrannised over his subjects in the most cruel manner, his successor sent him in chains to the caliph; yet the rebels made this year a great progress in the conquest of Khorasan. Next year the caliph marched in person against the rebels, who were daily becoming more formidable. The general rendezvous of his troops was in the plains of Rakka, whence he advanced with them to Bagdad. Having there supplied the troops with every thing necessary, he continued his march to the frontiers of Jorjan, where he was seized with an illness which grew

more violent after he had entered that province. Finding himself, therefore, unable to pursue his journey, he resigned the command of the army to his son Al Mamun, retiring himself to Tus in Khorasan. We are told by Khondemir that, before the caliph departed from Rakka, he had a dream wherein he saw a hand over his head full of red earth, and at the same time heard a person pronouncing these words, 'see the earth where Harun is to be buried.' Upon this he asked where he was to be buried; and was instantly answered, 'at Tus.' This dream greatly discomposing him, he communicated it to his chief physician, who endeavoured to divert him, and advised him to pursue some amusement, to draw his attention another way. The caliph accordingly prepared a magnificent regale for his courtiers, which lasted several days. After this he put himself at the head of his forces, and advanced to the confines of Jordan. As his disorder increased, he retired to Tus, where he sent for his physician, and said to him, 'Gabriel, do you remember my dream at Rakka? We are now arrived at Tus, the place of my interment. Send one of my eunuchs to fetch me a handful of the earth of this city.' Upon this, Masrur, a favorite eunuch, was despatched to bring a little earth. He soon brought a handful of red earth, which he presented to the caliph with his arm half bare. At the sight of this, Harun cried out, 'in truth this is the earth, and this is the very arm, that I saw in my dream.' His spirits immediately failing, and his malady being greatly increased by the perturbation of mind ensuing upon this sight, he died three days after, and was buried in Tus. Bashir Ebn Al Leith, the arch-rebel's brother, was brought in chains to the caliph, when at the point of death. At the sight of him Harun declared that if he could speak only two words he would say kill him; and immediately ordered him to be cut in pieces in his presence. This being done, the caliph soon after expired, in the year of the Hegira 193, having reigned twenty-three years. The distemper that put an end to his days is said to have been the bloody flux.

Upon the arrival of a courier from Tus, with the news of Al Raschid's death, his son Al Amin was immediately proclaimed caliph; and was no sooner seated on the throne than he formed a design of excluding his brother Al Mamun from the succession. Accordingly he deprived him of the furniture of the imperial palace at Khorasan; and in open violation of his father's will, who had bestowed on Al Mamun the perpetual government of Khorasan, and of all the troops in that province, he ordered these forces to march directly to Bagdad. Upon the arrival of this order, Al Mamun expostulated with the general Al Fadl Ebn Rabi, who commanded his troops, and endeavoured to prevent his marching to Bagdad; but without effect, for he punctually obeyed the orders sent by the caliph. Al Mamun, however, took care not to be wanting in fidelity to his brother. He obliged the people of Khorasan to take an oath of fidelity to Al Amin, and reduced some who had actually excited a considerable body of the people to revolt, while the general Al Fadl having ingratiated himself

with the caliph by his ready compliance with his orders, was chosen prime vizier, and governed with an absolute sway: Al Amin abandoning himself entirely to drunkenness. Al Fadl was a very able minister; though, fearing Al Mamun's resentment if ever he should ascend the throne, he gave Al Amin such advice as proved in the end the ruin of them both. He told him that his brother had gained the affection of the people of Khorasan by the good order and police he had established among them; that his unwearied application to the administration of justice had so attracted their esteem that the whole province was entirely at his devotion; that his own conduct was by no means relished by his subjects, whose minds were almost totally alienated from him; and therefore that he had but one part to act, which was to deprive Al Mamun of the right of succession that had been given him by his father, and transfer it to his own son Musa, though then but an infant. Agreeably to this pernicious advice, the caliph sent for his brother Al Kasem from Mesopotamia, and recalled Al Mamun from Khorasan, pretending he had occasion for him as an assistant in his councils. By this treatment Al Mamun was so much provoked that he resolved to come to an open rupture with his brother, in order if possible to frustrate his wicked designs. Instead, therefore, of going to Bagdad as he had been commanded, he cut off all communication between his own province and that capital; saying that, as his father Harun had assigned him the lieutenancy of Khorasan, he was responsible for all the disorders that might happen there during his absence. He also coined money, and would not suffer Al Amin's name to be impressed upon any of the dirhems or dinars struck in that province. Not content with this, he prevailed upon Rafe Ebn Al Leith, who had been for some time in rebellion, to join him with a body of troops; whose example was soon after followed by Harthema Ebn Aafan; which put him in possession of all the vast territory of Khorasan. Here he governed with an absolute sway, officiated in the mosque as Imam, and constantly harangued the people. In the 195th year of the Hegira, October 4th, 817, the caliph Al Amin, finding that his brother set him at defiance, declared war against him, and sent his general Ali Ebn Isa with an army of 60,000 men to invade Khorasan. Al Mamun, being informed that Ali was advancing against him with such a powerful army, put on foot all the troops he could raise, and gave the command to Thaher Ebn Hosein, one of the greatest generals of his age. Thaher, being a man of undaunted resolution, chose only 4000 men, whom he led against Al Amin's army. Ali, seeing so small a number of troops advancing against him, was transported with joy, and promised himself an easy victory. Despising his enemies, therefore, he behaved in a secure and careless manner; the consequence of which was that his army was entirely defeated, and himself killed, his head being afterwards sent as a present to Al Mamun, who amply rewarded Thaher and Harthema for their services. After this victory, Al Mamun assumed the title of caliph, and made all necessary preparations for carrying the war into

the very heart of his brother's dominions. For this purpose he divided his forces into two bodies, and commanded them to march into Irak by different routes. One of them obeyed the orders of Thaher, and the other of Harthema. The first directed his march to Ahwas, and the other towards Holwan, both of them proposing to meet in the neighbourhood of Bagdad, and after their junction to besiege that city. In the 196th year of the Hegira, Thaher Ebn Hosein made a most rapid progress with the troops under his command. Having advanced towards Ahwas, he there defeated a body of the caliph's forces; and, though the victory was by no means decisive, it so intimidated the commander of Ahwas, that he surrendered that fortress to him. This opened a way to Wafer on the Tigris, and facilitated the conquest of that place. After this he marched with his army to Al Madayen, the inhabitants of which immediately opened their gates to him. The rapidity of these conquests, and the infamous conduct of Al Amin, excited the people of Egypt, Syria, Hejaz, and Yemen, unanimously to declare for Al Mamun; who was accordingly proclaimed caliph in all these provinces. The next year Al Mamun's forces, under Thaher and Harthema, laid siege to Bagdad. As the caliph was shut up in that place, and it had a numerous garrison, the besieged made a vigorous defence, and destroyed a great number of their enemies. The besiegers, however, incessantly played upon the town with their catapults and other engines, though they were in their turn not a little annoyed by the garrison with the same sort of military machines. The latter likewise made continual sallies, and fought like men in despair, though they were always beaten back into the town with considerable loss. In short, the siege continued during the whole of this year, in which the greatest part of the eastern city, called the Camp of Al Mohdi, was demolished or reduced to ashes. The citizens, as well as the garrison, were reduced to the last extremity by the length and violence of the siege. In the beginning of the 198th year of the Hegira, Al Amin, finding himself deserted by his troops, as well as by the principal men of Bagdad, who had kept a private correspondence with Thaher, was obliged to retire to the old town on the west bank of the Tigris. He did not, however, take this step, before the inhabitants of the new town had formally deposed him, and proclaimed his brother Al Mamun caliph. Thaher, receiving advice of this, caused the old town to be invested, planted his engines against it, and at last starved it to a surrender. Al Amin, being thus reduced to the necessity of putting himself into the hands of one of the generals, chose to implore the protection of Harthema, whom he judged to be of a more humane disposition than Thaher. Having obtained this, he embarked in a small vessel in order to arrive at that part of the camp where Harthema was posted; but Thaher being informed of his design, which, if put in execution, he thought would eclipse the glory he had acquired, laid an ambush for him, which he had not the good fortune to escape. Upon his arrival in the neighbourhood of Harthema's tent, Thaher's soldiers rushed upon him,

drowned all his attendants, and put Al Amin himself in prison. Here he was soon after massacred by Thaher's servants, who carried his head in triumph to their master, by whose order it was afterwards exposed to view in the streets of Bagdad. Thaher afterwards sent it to Al Mamun in Khorasan, together with the ring or seal of the caliphate, the sceptre, and the imperial robe. At the sight of these Al Mamun fell down on his knees, and returned thanks to God for his success; making the courier who brought them a present of a million of dirhems, in value about £100,000 sterling. The same day that Al Amin was assassinated, his brother Al Mamun was proclaimed caliph at Bagdad. He had not been long seated on the throne, when he was alarmed by rebellions breaking out in different parts of the empire. These, however, were at last happily extinguished; after which Thaher Ebn Hosein had the government of Khorasan conferred upon him and his descendants with almost absolute and unlimited power. This happened in the 205th year of the Hegira, from which time we may date the dismemberment of that province from the empire of the caliphs. During the reign of this caliph nothing remarkable happened; only the African Saracens invaded the island of Sicily, where they made themselves masters of several places. He died of a surfeit, in the 218th year of the Hegira, having reigned twenty, and lived forty-eight or forty-nine years.

On the death of Al Mamun his brother Al Motasem, by some of the oriental historians surnamed Billah, was saluted caliph. He succeeded by virtue of Al Mamun's express nomination of him, to the exclusion of his own son Al Abbas, and his other brother Al Casem, who had been appointed by Harun Al Raschid. In the beginning of his reign he was obliged to employ the whole forces of his empire against one Babec, who had been for a considerable time in rebellion in Persia and Persian Irak. This Babec first appeared in the year of the Hegira 201, when he began to take upon him the title of a prophet. What his particular doctrine was is now unknown; but his religion is said to have differed from all others then known in Asia. He gained a great number of proselytes in Aderbijan and the Persian Irak, where he soon grew powerful enough to wage war with the caliph Al Mamun, whose troops he often beat, so that he was now become extremely formidable. The general sent by Al Motasem to reduce him was Heider Ebn Kans, surnamed Afshan, a Turk by nation, who had been brought a slave to the caliph's court, and, having been employed in disciplining the Turkish militia there, had acquired the reputation of a great captain. By him Babec was defeated with prodigious slaughter, no fewer than 60,000 men being killed in the first engagement. The next year, being the 220th of the Hegira, he received a still greater overthrow, losing 100,000 men, killed and taken prisoners. By this defeat he was obliged to retire into the Gordyaan mountains; where he fortified himself in such a manner that Afshan found it impossible to reduce him till the year of the Hegira 222. This commander, having reduced with invincible patience all Babec's castles, one after another, the impostor

was obliged to shut himself up in a strong fortress called Cashabad, which was now his last resource. Here he defended himself with great bravery for several months; but at last, finding he should be obliged to surrender, he made his escape into a neighbouring wood, whence he soon after came to Afshin upon that general promising him pardon. But Afshin no sooner had him in his power than he first caused his hands and feet, and afterwards his head, to be cut off. Babec had supported himself against the power of the caliphs for upwards of twenty years, during which time he had cruelly massacred 250,000 people; it being his custom to spare neither man, woman, nor child, of the Mahometans or their allies. Amongst the prisoners taken at Cashabad there was one Nud, who had been one of Babec's executioners, and who owned that, by his orders, he had destroyed 20,000 Saracens with his own hands; to which he added that vast numbers had also been executed by his companions. In the 223d year of the Hegira the Greek emperor Theophilus invaded the caliph's territories, where he behaved with the greatest cruelty, and by destroying Sozopetra, the place of Al Motasem's nativity, notwithstanding his earnest entreaties to the contrary, occasioned the terrible destruction of AMORIUM, mentioned under that article. The rest of this caliph's reign is remarkable for nothing but the execution of Afshin, who was accused of holding correspondence with the caliph's enemies. After his death a great number of idols were found in his house, which were immediately burned, as also several books said to contain impious and detestable opinions. In the 227th year of the Hegira died the caliph Al Motasem, in the forty-eighth or forty-ninth year of his age. He had reigned eight years eight months and eight days, was born in the eighth month of the year, fought eight battles, had 8000 slaves, and had 8,000,000 dinars and 80,000 dirhems in his treasury at his death; whence the oriental historians gave him the name Al Mothamen, or the Octonary. He is said to have been so robust that he once carried a burden of 1000 lbs. weight several paces. As the people of Bagdad disturbed him with frequent revolts and commotions, he took the resolution to abandon that city, and build another for his own residence. The new city he built was first called Samaria, and afterwards Sarra Manray, and stood in the Arabian Irak. He was attached to the opinion of the Moatazites, who maintain the creation of the Koran; and both he and his predecessor cruelly persecuted those who believed it to be eternal.

Al Motazem was succeeded by Al Wathek Ballah, who the following year, being the 228th of the Hegira, invaded and conquered Sicily. Nothing remarkable happened during the rest of his reign; he died in the 232d year of the Hegira, and was succeeded by his brother Al Motawakkel. The new caliph began his reign with an act of the greatest cruelty. The late caliph's vizier, having treated Al Motawakkel ill in his brother's lifetime, and opposed his election to the caliphate, was on that account now sent to prison. Here the caliph ordered him to be kept awake for several days and nights together: after

this, being suffered to fall asleep, he slept a whole day and night; and after he awoke was thrown into an iron furnace lined with spikes or nails heated red hot, where he was miserably burnt to death. During this reign nothing remarkable happened, except wars with the Greeks, which were carried on with various success. In the year 867, too, being the 245th of the Hegira, violent earthquakes happened in many provinces of the Saracen dominions; and the springs at Mecca failed to such a degree that the celebrated well Zemzem was almost dried up, and the water sold for 100 dirhems a bottle. In the 247th year of the Hegira the caliph was assassinated at the instance of his son Al Montaser; who succeeded him, and died in six months after. He was succeeded by Al Mostain, who, in the year of the Hegira 252 was forced to abdicate the throne by his brother Al Motazz, who afterwards caused him to be privately murdered. He did not long enjoy the dignity of which he had so iniquitously possessed himself; being deposed by the Turkish militia (who now began to set up and depose caliphs as they pleased) in the 255th year of the Hegira. After his deposition he was sent under an escort from Sarra Manray to Bagdad, where he died of thirst or hunger, after a reign of four years and about seven months. The fate of this caliph (however merited) was peculiarly hard: the Turkish troops had mutinied for their pay; and Al Motazz, not having money to satisfy their demands, applied to his mother, named Kabiba, for 50,000 dinars. This she refused, telling him that she had no money at all, although it afterwards appeared that she was possessed of immense treasures. After his deposition, however, she was obliged to discover them, and even deposit them in the hands of the new caliph Al Mokhtadi. They consisted of 1,000,000 dinars, a bushel of emeralds, and another of pearls, and three pounds and three quarters of rubies of the color of fire.

Al Mokhtadi, the new caliph, was the son of one of Al Wathek's concubines, named Korb, or Kark, said by some to have been a Christian. The beginning of his reign is remarkable for the irruption of the Zenjians, a people of Nubia, Ethiopia, and the country of Caffres, into Arabia, where they penetrated into the neighbourhood of Basra and Cufa. The chief of this gang of robbers, who, according to some of the Arab historians, differed but little from wild beasts, was Ali Ebn Mohammed Ebn Abdalrahman, who falsely gave himself out to be of the family of Ali Ebn Abu Taleb. This made such an impression upon the Shites in those parts that they flocked to him in great numbers; which enabled him to seize upon the cities of Basra and Ramla, and even to pass the Tigris at the head of a formidable army. He then took the title of prince of the Zenjians in order to ingratiate himself with those barbarians, of whom his army was principally composed. In the 256th year of the Hegira Al Mokhtada was barbarously murdered by the Turks, who had raised him to the throne; and was succeeded by Al Motamed the son of Al Motawakkel. This year the prince of the Zenjians, Ali, or Al Habib, made incursions to the very gates of Bagdad, doing prodigious

gious mischief wherever he passed. The caliph therefore sent against him one Jolan with a considerable army; he was overthrown, however, with very great slaughter by the Zenjian, who made himself master of twenty-four of the caliph's largest ships in the bay of Basra, put a vast number of the inhabitants of Obolla to the sword, seized upon the town, set fire to it, and soon reduced it to ashes, the houses mostly consisting of the wood of a certain plane-tree called by the Arabians saj. Thence he marched to Abadan, which likewise surrendered to him. Here he found an immense treasure, which enabled him to possess himself of the whole district of Ahwaz. In short, his forces being now increased to 80,000 strong, most of the adjacent territories, and even the caliph's court itself, were struck with horror. In the 257th year of the Hegira Al Habib continued victorious, defeated several armies sent against him by the caliph, reduced the city of Basra, and put 20,000 of the inhabitants to the sword. The following year the caliph, supported by his brother Al Mowaffek, had formed a design of circumscribing the power of the Turkish soldiery, who had for some time given law to the caliphs themselves. But this year the Zenjians made so rapid a progress in Persia, Arabia, and Irak, that he was obliged to suspend the execution of his design, and even to employ the Turkish troops to assist his brother Al Mowaffek in opposing these robbers. The first of the caliph's generals, who encountered Al Habib this year, was defeated in several engagements, and had his army at last entirely destroyed. After this Al Mowaffek and another general named Mosleh advanced against him. In the first engagement, Mosleh being killed by an arrow, the caliph's troops retired; but Al Mowaffek put them afterwards in such a posture of defence that the enemy durst not renew the attack. Several other sharp encounters happened this year, in which neither party gained great advantage; but at last, some contagious distempers breaking out in Al Mowaffek's army, he was obliged to conclude a truce, and retire to Waset to refresh his troops. In the 259th year of the Hegira, commencing November 7th, 881, the war between the caliph and Al Habib still continued. Al Mowaffek, upon his arrival at Bagdad, sent Mahommed, surnamed Al Mowalled, with a powerful army to act against the Zenjians; but he could not hinder them from ravaging the province of Ahwaz, cutting off about 50,000 of the caliph's subjects, and dismantling the city of Ahwaz; and, notwithstanding the utmost efforts of all the caliph's generals, no considerable advantages could be gained either this or the following year. In the 261st year of the Hegira, beginning October 16th, 883, Mohammed Ebn Wasel, who had killed the caliph's governor of Fars, and afterwards made himself master of that province, had several engagements with Al Habib. The caliph, having been apprised of the state of affairs on that side, annexed the government of Fars, Ahwaz, and Basra to the prefecture he had given to Musa Ebn Boga, whom he looked upon as one of the best generals he had. Musa, soon after his nomination to that post, sent Abdalrahman Ebn Mosleh as his

deputy to Ahwaz, giving him as a colleague and assistant one Tisam, a Turk. Mohammed Ebn Wasel, however, refusing to obey the orders of Abdalrahman and Tisam, a fierce conflict ensued, in which the latter were defeated, and Abdalrahman taken prisoner. After this victory Mahommed advanced against Musa Ebn Boga himself; but that general, finding he could not take possession of his new government without a vast effusion of blood, recalled the deputies from their provinces, and made the best of his way to Serra Manray. After this Yakub Ebn Al Leit, having taken Khorasan from the descendants of Thaher, attacked and defeated Mohammed Ebn Wasel, seizing on his palace, where he found a sum of money amounting to 40,000,000 dirhems. The next year Yakub being grown formidable by the acquisition of Ahwaz and a considerable portion of Fars, or at least the Persian Irak, declared war against the caliph. Against him Al Motamed despatched Al Mowaffek; who, having defeated him with prodigious slaughter, plundered his camp, and pursued him into Khorasan; where, meeting with no opposition, he entered Nisabur, and released Mahomet the Thaherian, whom Yakub had detained in prison three years. As for Yakub himself, he made his escape with great difficulty; though he and his family continued several years in possession of many of the conquests he had made. This war with Yakub proved a seasonable diversion in favor of Al Habib, who this year defeated all the forces sent against him, and ravaged the district of Waset. In the 263d of the Hegira, beginning September 24th, 885, the caliph's forces, under the command of Ahmed Ebn Lebuna, gained two considerable advantages over Al Habib; but, being at last drawn into an ambuscade, they were almost totally destroyed, their general himself making his escape with the utmost difficulty; nor were the caliph's forces able, during the course of the next year, to make the least impression upon these rebels. In the 265th year of the Hegira, beginning September 3d, 887, Ahmed Ebn Tolon rebelled against the caliph, and set up for himself in Egypt. Having assembled a considerable force, he marched to Antioch, and besieged Sima the governor of Aleppo, and all the provinces known among the Arabs by the name of Al Awsem in that city. As the besieged found that he was resolved to carry the place by assault, they thought fit, after a short defence, to submit, and to put Sima into his hands. Ahmed no sooner had that officer in his power than he caused him to be beheaded; after which he advanced to Aleppo, the gates of which were immediately opened unto him. Soon after he reduced Damascus, Hems, Hamath, Kinnisrin, and Al Rakka, situated upon the eastern bank of the Euphrates. This rebellion so exasperated Al Motamed that he caused Ahmed to be publicly cursed in all the mosques belonging to Bagdad and Irak; and Ahmed on his part ordered the same malediction to be thundered out against the caliph in all the mosques within his jurisdiction. This year also a detachment of Al Habib's troops penetrated into Irak, and made themselves masters of four of the caliph's ships laden with corn; they then advanced to Al Nomanic, laid

the greatest part of it in ashes, and carried off with them several of the inhabitants prisoners. After this they possessed themselves of Jarjaraya, where they found many more prisoners, and destroyed all the adjacent territory with fire and sword. This year there were four independent powers in the Saracen dominions, besides the house of Ommyyah in Spain: viz. the African Saracens, or Aglabites, who had for a long time acted independently; Ahmed in Syria and Egypt; Al Leit in Khorasan; and Al Habbib in Arabia and Irak. In the 266th year of the Hegira, beginning August 23d, 888, Al Habbib reduced Ramhormoz, burnt the stately mosque there to the ground, put a vast number of the inhabitants to the sword, and carried away great numbers, as well as a vast quantity of spoil.

This was his last successful campaign; for the year following Al Mowaffek, attended by his son Abul Abbas, having attacked him with a body of 10,000 horse and a few infantry, notwithstanding the vast disparity of numbers (Al Habbib's army amounting to 100,000 men), defeated him in several battles, recovered most of the towns he had taken, together with an immense quantity of spoil, and released 5000 women who had been thrown into prison by these barbarians. After these victories Al Mowaffek took post before the city of Al Mabiya, built by Al Habbib, and the palace of his residence; burnt all the ships in the harbour; thoroughly pillaged the town; and then entirely dismantled it. After the reduction of this place, in which he found immense treasures, Al Mowaffek pursued the flying Zenjians, put several of their chiefs to the sword, and advanced to Al Mokhtara, a city built by Al Habbib. As the place was strongly fortified, and Al Habbib was posted in its neighbourhood with an army, according to Abn Jaafar Al Tabari, of 300,000 men, Al Mowaffek perceived that the reduction of it would be a matter of some difficulty. He therefore built a fortress opposite to it, where he erected a mosque, and coined money. The new city, from its founder, was called by the Arabs Al Mowaffekkia, and soon rendered considerable by the settlement of several wealthy merchants there. The city of Al Mokhtara, being reduced to great straits, was at last taken by storm, and given up to be plundered by the caliph's troops; after which Al Mowaffek defeated the numerous forces of Al Habbib in such a manner that they could no more be rallied during that campaign. In the year 268 of the Hegira Al Mowaffek penetrated again into Al Mabiya, and demolished the fortifications which had been raised since its former reduction, though the rebels disputed every inch of ground. Next year he again attacked Al Habbib with great bravery; and would have entirely defeated him, had he not been wounded in the breast with an arrow, which obliged him to retreat. However, as soon as he was cured of his wound, Al Mowaffek advanced a third time to Al Mabiya, made himself master of that metropolis, threw down the walls that had been raised, put many of the inhabitants to the sword, and carried a vast number of them into captivity. The year 270 of the Hegira, commencing July 11th, 892, proved fatal to the rebel Al Habbib. Al Mowaffek

made himself a fourth time master of Al Mabiya, burnt Al Habbib's palace, seized upon his family, and sent them to Sarra Manray. As for the usurper himself he escaped; but being closely pursued by Al Mowaffek into the province of Ahwaz, where the shattered remains of his forces were entirely defeated, he at last fell into the hands of the victor, who ordered his head to be cut off, and carried through a great part of that region which he had so long disturbed. By this complete victory Al Mowaffek obtained the title of Al Nasir Lidmalbah, that is, the protector of Mahometanism. This year also died Ahmed Ebn Tolun, who had seized upon Egypt and Syria, and was succeeded by his son Khamarawiyah. The next year a bloody engagement happened between the caliph's forces commanded by Al Mowaffek's son and those of Khamarawiyah, who had made an irruption into the caliph's territories. The battle was fought between Al Ramla and Damascus. In the beginning Khamarawiyah found himself so hard pressed that his men were obliged to give way; upon which, taking for granted that all was lost, he fled with great precipitation, even to the borders of Egypt; but in the mean time his troops, being ignorant of the flight of their general, returned to the charge and gained a complete victory. After this Khamarawiyah, by his just and mild administration, so gained the affections of his subjects that the caliph found it impossible to gain the least advantage over him. In the year of the Hegira 276 he overthrew one of the caliph's generals, named Abul Saj, at Al Bathnia, near the city of Damascus; after which he advanced to Al Rakka on the Euphrates, and made himself master of that place. Having annexed several large provinces to his former dominions, and left some of his friends in whom he could confide to govern them, he then returned into Egypt, the principal part of his empire, which now extended from the Euphrates to the borders of Nubia and Ethiopia. The following year, the 278th of the Hegira, was remarkable for the death of Al Mowaffek. He died of the elephantiasis or leprosy; and, while in his last illness, said that, of 100,000 men whom he commanded, there was not one so miserable as himself. This year was also remarkable for the first disturbances raised in the Saracen empire by the Karmatians. The origin of this sect is uncertain; but the most common opinion is that a poor fellow, by some called Karmata, came from Khuzestan to the villages near Cufa, and there pretended great sanctity, and that God had enjoined him to pray fifty times a day, inviting people to the obedience of a certain imam of the family of Mahomet; and this way of life he continued till he had made a very great party, out of whom he chose twelve as his apostles to govern the rest, and to propagate his doctrines. He also assumed the title of prince, and obliged every one of his earlier followers to pay him a dinar a year. But Al Haidam, the governor of that province, finding that men neglected their work, to say those fifty prayers a day, seized the fellow, and, having put him in prison, swore that he should die. This being overheard by a girl, belonging to the governor, she, out of compassion, took the key of the dungeon at night from

under her master's head, released Karmata, and restored the key to its place. The next morning the governor found his prisoner gone; and the accident, being publicly known, raised great admiration: Karmata's adherents giving out that God had taken him into heaven. After this he appeared in another province, and declared to a great number of people that it was not in the power of any person to do him hurt; notwithstanding which, his courage failing him, he retired into Syria, and was never heard of more. After his disappearance the sect continued and increased: his disciples pretending that their master had manifested himself to be a true prophet, and had left them a new law, wherein he had changed the ceremonies and form of prayer used by the Mahometans, &c. From this year (278) these sectaries gave almost continual disturbance to the caliphs and their subjects, committing great disorders in Chaldea, Arabia, and Mesopotamia, and at length established a considerable principality. In the 279th year of the Hegira died the caliph Al Motamed; and was succeeded by Al Motaded, son to Al Mowaffek.

In the first year of his reign, Al Motaded demanded in marriage the daughter of Khamarawiyah, sultan, or caliph, in Egypt; which was agreed to, and their nuptials were solemnised with great pomp in the 282d year of the Hegira. He carried on a war with the Karmatians; but very unsuccessfully, his forces being defeated with great slaughter, and his general Al Abbas taken prisoner. This caliph also granted to Harun, son to Khamarawiyah, the perpetual prefecture of Awasam and Kinnisrin, which he annexed to that of Egypt and Syria, upon condition that he paid him an annual tribute of 45,000 dinars. He died in the year of the Hegira 289, and was succeeded by his son Al Moctasi, who proved a warlike and successful prince. He gained several advantages over the Karmatians, but was not able to reduce them. The Turks, however, having invaded the province of Mawaralnahar, were defeated with great slaughter; after which Al Moctasi carried on a successful war against the Greeks, from whom he took Seleucia. After this he invaded Syria and Egypt, which provinces he recovered from the house of Ahmed Ebn Tolun. The reduction of Egypt happened in the 292d year of the Hegira, after which the war was renewed with success against the Greeks and Karmatians. The caliph died in the 295th year of the Hegira, after a reign of about six years and a half. He was the last of the caliphs who made any figure by their warlike exploits. His successors Al Moktader, Al Kaher, and Al Radi, were so distressed by the Karmatians and numberless usurpers who were every day starting up, that by the 325th year of the Hegira they had nothing

left but the city of Bagdad. In the 324th year of the Hegira, commencing November 30th, 946, the caliph Al Radi, finding himself distressed on all sides by usurpers, and having a vizier of no capacity, instituted a new office superior to that of vizier, which he entitled *emir al omra*, or commandant of commandants. This great officer was trusted with the management of military affairs, and had the entire management of the finances, in a much more absolute and unlimited manner than any of the caliph's viziers ever had. Nay, he officiated for the caliph in the great mosque at Bagdad, and had his name mentioned in the public prayers throughout the kingdom. In short, the caliph was so much under the power of this officer, that he could not apply a single dinar to his own use without the leave of the *emir al omri*. In the year 325 the Saracen empire, once so great and powerful, was shared among the following usurpers:—1. The cities of Waset, Basra, and Cufa, with the rest of the Arabian Irak, were considered as the property of the *emir al omra*, though they had been in the beginning of the year seized upon by a rebel called Al Barilli, who could not be driven out of them. 2. The country of Pars, Farsistan, or Persia, properly so called, was possessed by Amado'ddawia Ali Ebn Bulya, who resided in the city of Shiraz. 3. Part of the tract denominated Al Jebal, together with Persian Irak, which is the mountainous part of Persia, and the country of the ancient Parthians, obeyed Rucno'ddawla, the brother of Amao'ddawla, who resided at Ispahan. The other part of that country was possessed by Washmakin the Deylamite. 4. Diyar Rabia, Diyar Beer, Diyar Modar, and the city of Al Mawsel, or Mosul, acknowledged for their sovereign a race of princes called Hamdanites. 5. Egypt and Syria no longer obeyed the caliphs, but Mahomet Ebn Taj, who had formerly been appointed governor of these provinces. 6, 7. Africa and Spain had long been independent. 8, 9. Sicily and Crete were governed by princes of their own. 10, 11. The provinces of Khorasan and Mawaralnahar were under the dominion of Ai Nasr Ebn Ahmed, of the dynasty of the Samaritans. 12—14. The provinces of Tabrestan, Jorjan or Georgiana, and Mazanderan, had kings of the first dynasty of the Deylamites. 15. The province of Kerman was occupied by Abu Ali Mahomet Ebn Eylyia Al Sammani, who had made himself master of it a short time before. 16. Lastly, the provinces of Yamana and Bahrein, including the district of Hajr, were in the possession of Abu Thaeir the Karmatian. Farther particulars respecting the history of the Saracens will be found under the articles already referred to, and particularly under SPAIN, where they were more generally styled Moors than either Saracens, Arabs, Moslems, or Mussulmans.

SARAGOSSA, or ZARAGOSSA, a city in the north of Spain, on the south bank of the Ebro, the capital of Arragon, and the see of an archbishop. It is surrounded by an earthen wall, and has twelve gates: the town being built on the site of the ancient Salpuba, which was enlarged by Augustus, and thence called Caesar

Augusta, corrupted subsequently into Saragossa. The canal of Arragon approaches it both east and west. It is a large place, built throughout of brick, but the houses are seldom above three stories in height; and the streets generally narrow and crooked. But there is one long and wide street called the Cozo, and two bridges

over the Ebro, one of wood, said to be the finest of the kind in Europe.

Saragossa has a Gothic cathedral, sixteen other churches, and nearly forty convents. The church of our 'Lady of the Pillar' is remarkable for its supposed miraculous image; and that of St. Engracia for various relics.

This city is the residence of the intendant, captain-general, and high court of justice of Aragon; and of a small garrison. It has a university founded in 1478, and an academy of fine arts. Here are also two public libraries. The climate is temperate, and of far less intense heat than the south of Spain.

This city is chiefly celebrated for its dreadful sieges in 1808 and 1809. The French attempted to take it by assault in 1808, but were repulsed with loss. Returning with augmented numbers, they invested nearly half the town, in defence of which the citizens were indefatigable, the batteries being served by both sexes. However, on the 4th of August, the French beat down the wall on the right bank of the Guerva, and enabled their troops to force their way into the Cozo. Being thus in possession of nearly half the town, the contest seemed only to have begun: for the inhabitants defended house after house, and made a number of nocturnal attacks on the part occupied by the French: eventually the latter, making no progress, on the 14th of August retired. The siege of the following year was no less obstinate. Having received great reinforcements, and entirely defeated various Spanish armies, the French marched in November (1808) once more upon this point. Their plan was now to destroy the city partly by bombs, or by mining, and their first attack (December 20th) gave them possession of some important posts. The bombardment commenced on the 10th of January, which, violent as it was, caused less injury than a fever now raging in the garrison: and Saragossa was crowded with soldiers. It continued, however, to make a brave resistance, and it was not till after a bombardment of six weeks, and a very unequal contest in mining, that Palafox, its noble commander, surrendered. 175 miles E. N. E. of Madrid. Population 50,000.

Dr. Southey's eloquent narrative of the siege of 1808, in his *History of the Peninsular War*, is amongst the most successful productions of his ever-able pen. We are quite sure our readers will only wish that, instead of the following abstract, we could have given the entire chapter he has devoted to this memorable conflict:—

'A regular siege was to be expected; how were the citizens to sustain it with their brick walls, without heavy artillery, and without troops who could sally to interrupt the besiegers in their works? In spite of all these discouraging circumstances, confiding in God and their own courage, they determined to defend the streets to the last extremity. Palafox, immediately after the repulse of the enemy, set out to muster reinforcements, to provide such resources for the siege as he could, and to place the rest of Arragon in a state of defence, if the capital should fall. The besiegers' army was soon reinforced by general Verdier with 2500 men, besides some

battalions of Portuguese, who, according to the devilish system of Buonaparte's tyranny, had been forced out of their country, to be pushed on in the foremost ranks, wherever the first fire of a battery was to be received, a line of bayonets clogged, or a ditch filled, with bodies. They occupied the best positions in the surrounding plain, and, on the 27th, attacked the city and the Torrero; but they were repulsed with the loss of 800 men, six pieces of artillery, and five carts of ammunition. By this time they had invested nearly half the town. The next morning they renewed the attack at both places; from the city they were again repulsed, losing almost all the cavalry who were engaged. But the Torrero was lost through the alleged misconduct of an artillery officer, who was charged with having made his men abandon the batteries at the most critical moment. For this he was condemned to run the gauntlet six times, the soldiers beating him with their ramrods, and after this cruelty he was shot.

'The French having now received a train of mortars, howitzers, and twelve-pounders, which were of sufficient calibre against mud walls, kept up a constant fire, and showered down shells and grenades from the Torrero. About 1200 were thrown into the town, and there was not one building that was bomb-proof within the walls. After a time the inhabitants placed beams of timber together endways against the houses, in a sloping direction, behind which those who were near when a shell fell might shelter themselves. The enemy continued also to invest the city more closely, while the Arragonese made every effort to strengthen their means of defence. They tore down the awnings from their windows, and formed them into sacks which they filled with sand, and piled up before the gates, in the form of a battery, digging round it a deep trench. They broke holes for musketry in the walls and intermediate buildings, and stationed cannon where the position was favorable for it. The houses in the environs were destroyed. 'Gardens and olive grounds,' says an eye-witness, 'that in better times had been the recreation and support of their owners, were cheerfully rooted up by the proprietors themselves, wherever they impeded the defence of the city, or covered the approach of the enemy.' Women of all ranks assisted; they formed themselves into companies, some to relieve the wounded, some to carry water, wine, and provisions, to those who defended the gates. The countess Burita instituted a corps for this service; she was young, delicate, and beautiful. In the midst of the most tremendous fire of shot and shells, she was seen coolly attending to those occupations which were now become her duty; nor throughout the whole of a two months' siege did the imminent danger, to which she incessantly exposed herself, produce the slightest apparent effect upon her, or in the slightest degree bend her from her heroic purpose. Some of the monks bore arms; others exercised their spiritual offices to the dying; others, with the nuns, were busied in making cartridges which the children distributed.

'Among 60,000 persons there will always

be found some wicked enough for any employment, and the art of corrupting has constituted great part of the French system of war. During the night of the 28th the powder magazine, in the area where the bull fights were performed, which was in the very heart of the city, was blown up, by which fourteen houses were destroyed, and about 200 persons killed. This was the signal for the enemy to appear before three gates which had been sold to them. And, while the inhabitants were digging out their fellow citizens from the ruins, a fire was opened upon them with mortars, howitzers, and cannons, which had now been received for battering the town. Their attack seemed chiefly to be directed against the gate called Portillo, and a large square building near it, without the walls, and surrounded by a deep ditch; though called a castle, it served only for a prison. The sand-bag battery before this gate was frequently destroyed, and as often reconstructed under the fire of the enemy. The carnage here throughout the day was dreadful.

Augustina Zaragoza, a handsome woman of the lower class, about twenty-two years of age, arrived at this battery with refreshments, at the time when not a man who defended it was left alive, so tremendous was the fire which the French kept up against it. For a moment the citizens hesitated to re-man the guns. Augustina sprung forward over the dead and dying, snatched a match from the hand of a dead artilleryman, and fired off a six-and-twenty pounder; then, jumping upon the gun, made a solemn vow never to quit it alive during the siege. Such a sight could not but animate with fresh courage all who beheld it. The Saragossans rushed into the battery, and renewed their fire with greater vigor than ever, and the French were repulsed here and at all other points with great slaughter.

Lefebvre probably was so indignant at meeting with any opposition from a people whom he despised, and a place which, according to the rules and pedantry of war, was not tenable, that he lost his temper, and thought to subdue them the shortest way, by mere violence and superior force. Having found his mistake, he proceeded to invest the city still more closely. In the beginning of the siege, the besieged received some scanty succors; yet, however scanty, they were of importance. 400 soldiers from the regiment of Estremadura, small parties from other corps, and a few artillerymen got in; 200 of the militia of Logrono were added to these artillerymen, and soon learnt their new service, being in the presence of an enemy whom they had such righteous reason to abhor. Two four-and-twenty pounders and a few shells, which were much wanted, were procured from Lerida. The enemy, mean time, were amply supplied with stores from the magazine in the citadel of Pamplona, which they had so perfidiously seized on their first entrance, as allies, into Spain. Hitherto the had remained on the right bank of the Ebro. On the 11th of July they forced the passage of the ford, and posted troops enough on the opposite side to protect their workmen while forming a floating bridge. In spite of all the efforts of the Arragonese, this bridge was completed on the

14th; a way was thus made for their cavalry, to their superiority in which the French were mostly indebted for all their victories in Spain. This gave them the command of the surrounding country; they destroyed the mills, levied contributions on the villages, and cut off every communication by which the besieged had hitherto received supplies. These new difficulties called out new resources in this admirable people and their general,—a man worthy of commanding such a people in such times. Corn-mills, worked by horses, were erected in various parts of the city; the monks were employed in manufacturing gunpowder, materials for which were obtained by immediately collecting all the sulphur in the place, by washing the soil of the streets to extract its nitre, and making charcoal from the stalks of hemp, which in that part of Spain grows to a magnitude that would elsewhere be thought very unusual.

By the end of July the city was completely invested, the supply of food was scanty, and the inhabitants had no reason to expect succor. Their exertions had now been unremitted for forty-six days, and nothing but the sense of duty could have supported their bodily strength and their spirit under such trials. They were in hourly expectation of another general attack, or another bombardment. They had not a single place of security for the sick and the children, and the number of wounded was daily increased by repeated skirmishes, in which they engaged for the purpose of opening a communication with the country. At this juncture they made one desperate effort to recover the Torrero. It was in vain; and convinced by repeated losses, and especially by this last repulse, that it was hopeless to make any effectual sally, they resolved to abide the issue of the contest within the walls, and conquer or perish there.

On the night of the 2d of August, and on the following day, the French bombarded the city from their batteries opposite the gate of the Carmens. A foundling hospital, which was now filled with the sick and wounded, took fire, and was rapidly consumed. During this scene of horror the most intrepid exertions were made to rescue these helpless sufferers from the flames. No person thought of his own property or individual concerns—every one hastened thither. The women were eminently conspicuous in their exertions, regardless of the shot and shells which fell about them, and braving the flames of the building. It has often been remarked that the wickedness of women exceeds that of the other sex; for the same reason, when circumstances, forcing them out of the sphere of their ordinary nature, compel them to exercise manly virtues, they display them in the highest degree, and, when they are once awaked to a sense of patriotism, they carry the principle to its most heroic pitch. The loss of women and boys during this siege was very great, fully proportionate to that of men; they were always the most forward, and the difficulty was to teach them a prudent and proper sense of their danger. On the following day the French completed their batteries upon the right bank of the Guerva, within pistol-shot of the gate of St. Eufracia, so called from a

splendid church and convent of Jeronimites, situated on one side of it.

On the 4th of August the French opened batteries within pistol-shot of this church and convent. The mud walls were levelled at the first discharge; and the besiegers, rushing through the opening, took the batteries before the adjacent gates in reverse. Here general Mori, who had distinguished himself on many former occasions, was made prisoner. The street of St. Engracia, which they had thus entered, leads into the Cozo, and the corner buildings where it is thus terminated were on the one hand the convent of St. Francisco, and on the other the general hospital. Both were stormed and set on fire; the sick and the wounded threw themselves from the windows to escape the flames, and the horror of the scene was aggravated by the maniacs, whose voices, raving or singing in paroxysms of wilder madness, or crying in vain to be set free, were heard amid the confusion of dreadful sounds. Many fell victims to the fire, and some to the indiscriminating fury of the assailants. Those who escaped were conducted as prisoners to the Torero; but, when their condition had been discovered, they were sent back on the morrow to take their chance in the siege. After a severe contest, and dreadful carnage, the French forced their way into the Cozo in the very centre of the city; and, before the day closed, were in possession of one half of Saragossa. Lefebvre now believed that he had effected his purpose, and required Palafox to surrender in a note containing only these words:—‘Head-quarters. St. Engracia. Capitulation!’ The heroic Spaniard immediately returned this reply:—‘Head-quarters, Saragossa. War at the knife’s point!’

The contest which was now carried on is unexampled in history. One side of the Cozo, a street about as wide as Pall Mall, was possessed by the French; and, in the centre of it, their general, Verdier, gave his orders from the Franciscan convent. The opposite side was maintained by the Arragonese, who threw up batteries at the openings of the cross streets, within a few paces of those which the French erected against them. The intervening space was presently heaped with dead, either slain upon the spot or thrown out from the windows. Next day the ammunition of the citizens began to fail; the French were expected every moment to renew their efforts for completing the conquest, and even this circumstance occasioned no dismay, nor did any one think of capitulation. One cry was heard from the people, wherever Palafox rode among them, that, if powder failed, they were ready to attack the enemy with their knives—formidable weapons in the hands of desperate men. Just before the day closed Don Francisco Palafox, the general’s brother, entered the city with a convoy of arms and ammunition, and a reinforcement of 3000 men, composed of Spanish guards, Swiss, and volunteers of Arragon: a succor as little expected by the Saragossans as it had been provided against by the enemy.

The war was now continued from street to street, from house to house, and from room to room; pride and indignation having wrought

up the French to a pitch of obstinate fury little inferior to the devoted courage of the patriots. During the whole siege no man distinguished himself more remarkably than the curate of one of the parishes, within the walls, by name P. Santiago Sass. He was always to be seen in the streets, sometimes fighting with the most determined bravery against the enemies, not of his country alone, but of freedom, and of all virtuous principles, wherever they were to be found; at other times administering the sacrament to the dying, and confirming, with the authority of faith, that hope which gives to death, under such circumstances, the joy, the exultation, the triumph, and the spirit of martyrdom. Palafox reposed the utmost confidence in this brave priest, and selected him whenever any thing peculiarly difficult or hazardous was to be done. At the head of forty chosen men, he succeeded in introducing a supply of powder into the town, so essentially necessary for its defence.

This most obstinate and murderous contest was continued for eleven successive days and nights, more indeed by night than by day; for it was almost certain death to appear by daylight within reach of those houses which were occupied by the other party. But, under cover of the darkness, the combatants frequently dashed across the street to attack each other’s batteries; and the battles which began there were often carried on into the houses beyond, where they fought from room to room and floor to floor. The hostile batteries were so near each other that a Spaniard in one place made way under cover of the dead bodies, which completely filled the space between them, and fastened a rope to one of the French cannons; in the struggle which ensued, the rope broke, and the Saragossans lost their prize at the very moment when they thought themselves sure of it.

A new horror was added to the dreadful circumstances of war in this ever memorable siege. In general engagements the dead are left upon the field of battle, and the survivors remove to clear ground and an untainted atmosphere; but here—in Spain, and in the month of August, there where the dead lay the struggle was still carried on, and pestilence was dreaded from the enormous accumulation of putrefying bodies. Nothing in the whole course of the siege so much embarrassed Palafox as this evil. The only remedy was to tie ropes to the French prisoners, and push them forward amid the dead and dying, to remove the bodies, and bring them away for interment. Even for this necessary office there was no truce, and it would have been certain death to the Arragonese who should have attempted to perform it; but the prisoners were in general secured by the pity of their own soldiers, and in this manner the evil was in some degree diminished.

A council of war was held by the Spaniards on the 8th, not for the purpose which is too usual in such councils, but that their heroic resolution might be communicated with authority to the people. It was that, in those quarters of the city where the Arragonese still maintained their ground, they should continue to defend themselves with the same firmness: should the enemy

at last prevail, they were then to retire over the Ebro into the suburbs, break down the bridge, and defend the suburbs till they perished. When this resolution was made public, it was received with the loudest acclamations. But in every conflict the citizens now gained ground upon the soldiers, winning it inch by inch, till the space occupied by the enemy, which on the day of their entrance was nearly half the city, was gradually reduced to about an eighth part. Meantime, intelligence of the events in other parts of Spain was received by the French—all tending to dishearten them; the surrender of Dupont, the failure of Monecy before Valencia, and the news that the junta of that province had despatched 6000 men to join the levies in Arragon, which were destined to relieve Saragossa. During the night of the 13th their fire was particularly fierce and destructive: after their batteries had ceased, flames burst out in many parts of the buildings which they had won; their last act was to blow up the church of St. Engracia; the powder was placed in the subterranean church—and this remarkable place—this monument of fraud and of credulity—the splendid theatre wherein so many feelings of deep devotion had been excited—which so many thousands had visited in faith, and from which unquestionably many had departed with their imaginations elevated, their principles ennobled, and their hearts strengthened, was laid in ruins. In the morning the French columns, to the great surprise of the Spaniards, were seen at a distance, retreating over the plain, on the road to Pamplona.

‘The history of a battle, however skilfully narrated, is necessarily uninteresting to all except military men; but, in the detail of a siege, when time has destroyed those considerations which prejudice or pervert our natural sense of right and wrong, every reader sympathises with the besieged, and nothing, even in fictitious narratives, excites so deep and animating an interest. There is not, either in the annals of ancient or of modern times, a single event recorded more worthy to be held in admiration, now and for evermore, than the siege of Saragossa. Will it be said that this devoted people obtained for themselves, by all this heroism and all these sacrifices, nothing more than a short respite from their fate! Woe be to the slavish heart that conceives the thought, and shame to the base tongue that gives it utterance! They purchased for themselves an everlasting remembrance upon earth—a place in the memory and love of all good men in all ages that are yet to come. They performed their duty; they redeemed their souls from the yoke; they left an example to their country never to be forgotten, never to be out of mind, and sure to contribute to and hasten its deliverance.’—*Southey's Works*, 3 vols. 4to., pp. 405—421, Vol. I.

SARAI [Heb. שַׂרַי, i. e. lady], and SARAI [Heb. i. e. my mistress], names of the patriarch Abraham's wife. She is supposed to be the same with Israh, the daughter of Haran, Abraham's younger brother by a different mother, and consequently the sister of Lot. Her beauty and consequent danger in the courts of Egypt and

Gerar; her entertainment of the angels; her barrenness till her ninetieth year, with her miraculous conception and the birth of Isaac in her ninety-first; her turning off Hagar, with her death and burial in her 128th year, are recorded in Genesis xii. xviii. xx. xxi. xxiii.

SARASIN (John Francis), a French author, born at Hermauville, near Caen, in Normandy, about 1604. He studied at Caen, and afterwards went to Paris; where he became eminent for his wit and humor. He afterwards travelled through Germany, and, upon his return, became secretary to the prince of Conti, whom he prevailed upon to marry the niece of cardinal Mazarine, in reward for which he is said to have received a large sum. But the prince, afterwards hearing of his venality, dismissed him, which is said to have brought on his death. He published, 1. *Discours de la Tragedie*: 2. *L'Histoire du Siege de Dunkerque*; and, 3. *La Pompe funebre de Voiture*: inserted in the *Miscellanea of Menage*; to whose care he left all his MSS., from which Menage published a 4to. vol. at Paris, in 1656, and other 2 vols. in 1675; consisting of various essays in prose and poetry, which are esteemed. He died in 1654.

SARATOGA, a county and town of New York. The county has a population of 33,000, chief town Ballston. The town is twelve miles north-east of that place, and gives name to several mineral springs. The most noted, those of Saratoga and Ballston, are the most celebrated mineral waters in the United States. They are strongly impregnated with carbonic acid, and contain also carbonate of soda, muriate of soda, supercarbonated lime, and a carbonate of iron. They are much frequented, during the warm months, by gay and fashionable people, as well as by invalids. The principal springs in Saratoga are Congress Spring, and Rock Spring, which are situated in the west part of the town, seven miles N. N. E. of Ballston, twelve west of the Hudson, thirty-two north of Albany. Here is a large, handsome, and flourishing village, with a post office, a Presbyterian church, and boarding-houses which afford excellent accommodations for visitors. Saratoga is memorable as the place where general Burgoyne surrendered the British army to general Gates, October 17th, 1777.

SARATOV, an important province of Russia, situated on the Wolga, partly in Europe, and partly in Asia; having on the one side the country of the Don Cossacks, and on the other that of Astracan. Containing an area of 91,000 square miles, its population is so thin as not to exceed 1,000,000; and a great part of the tract to the east of the Wolga is so impregnated with salt as to be in many parts unfit for the growth of vegetables. Of the salt lakes in this quarter, the most productive is that of Jeltou. The country to the west of the Wolga is fitted partly for tillage, and partly for pasturage. The great danger to vegetation here is from locusts, swarms of which often appear in summer. Attempts were made in the last century, by the Russian government, to improve particular spots by German settlers; and these colonists form the chief merchants and manufacturers of the country; but their success has been very limited.

SARATOV, a neat town of European Russia, the capital of the above government, stands on the Wolga, surrounded by a wall and ditch; the houses are mostly of wood. It has an active trade between Moscow and Astracan, and a fine command of water carriage: the articles of traffic not derived from these cities are fish, caviar, and salt. Inhabitants 5000. 374 miles north by west of Astracan, and 465 south-east of Moscow.

SARCASM, *n. s.* } *Fr. sarcasme; Lat. sar-*
SARCASTIC, *adj.* } *casmus.* A keen reproach;
SARCASTICAL, }
SARCASTICALLY. } a taunt; a gibe: the ad-
 jective and adverb corre-
 sponding.

He asked a lady playing with a lap-dog, whether the women of that country used to have any children or no? thereby *sarcastically* reproaching them for misplacing that affection upon brutes which could only become a mother to her child. *South.*

What a fierce and *sarcastick* reprehension would this have drawn from the friendship of the world, and yet what a gentle one did it receive from Christ!

Id.

Sarcasms of wit are transmitted in story.

Government of the Tongue.

Rejoice, O young man, says Solomon, in a severe *sarcasm*, in the days of thy youth, and walk in the ways of thy heart; but know that for these things God will bring thee into judgment.

Rogers's Sermons.

Epithets may be found in great plenty at Billingsgate; *sarcasm* and irony learned upon the water; and the epiphonema or exclamation frequently from the bear-garden, and as frequently from the 'hear him,' of the house of commons. *Pope.*

When an angry master says to his servant, It is bravely done, it is one way of giving a severe reproach; for the words are spoken by way of *sarcasm*, or irony. *Watts.*

SARCONET, *n. s.* Derived by Skinner from *Lat. sericum saracenicum*. Fine thin woven silk.

Why art thou then exasperate, thou idle immaterial skein of sley'd silk, thou green *sarconet* flap for a sore eye, thou tassel of a prodigal's purse?

Shakspeare. Troilus and Cressida.

If they be covered, though but with linen or *sarconet*, it intercepts the effluvium. *Browne.*

These are they that cannot bear the heat Of figured silks, and under *sarconets* sweat.

Dryden.

She darts from *sarconet* ambush wily leers,
 Twitches thy sleeve, or with familiar airs
 Her fan will pat thy cheek; these snares disdain.

Gay.

SARCOCELE. See **SURGERY**.

SARCOCOLLA, a concrete juice brought from Persia and Arabia, in small whitish yellow grains, with a few of a reddish, and sometimes of a deep red color mixed with them; the whitest tears are preferred as being the freshest; its taste is bitter, accompanied with a dull kind of sweetness. This drug dissolves in watery liquors, and is used in medicine.

SARCOPHAGUS [*Gr. σαρκοφάγος*, from *σαρξ*, flesh, and *φάγω*, to eat], in architecture, the name of a stone found, according to Pliny, in the Troad, and of which tombs were constructed on account of its caustic qualities. It is said to have perfectly consumed the flesh of human bodies buried in it in the space of forty days.

This property, for which it was greatly celebrated, is mentioned by all the ancient naturalists. There was another very singular quality also attached to it, but whether to all, or only to some peculiar pieces of it, is not known; that is, its turning into stone any thing that was put into vessels made of it. This is recorded only by Mutianus and Theophrastus, except that Pliny had copied it from these authors, and some of the later writers from him.

The custom of burying the dead is probably more ancient than that of burning their bodies. Mythology attributes the latter mode to Hercules, while it assigns the earliest usage of the former method to the primitive Greeks and Romans. In the Greek colonies of Italy they buried, as we do, the entire body; and, even when the custom of burning the body became general among the Romans, several families retained that of interment. But the term sarcophagus is by no means limited to a particular kind of stone. Indeed, its more generally accepted meaning is a sort of coffin, made, among the ancients, either of stone, of marble, or porphyry. The Greeks also sometimes employed hard wood, which was calculated to resist humidity, such principally as oak, cedar, or cypress. Occasionally also they used terra cotta, and even metal. The form of these sarcophagi was ordinarily a parallelopipedon—namely, a long square, such as our coffin. Sometimes the angles were rounded, thus assuming an elliptical shape. The lid of the sarcophagus varies both in shape and ornament. Sometimes it bears the statue of the person inhumed therein, often lying down in the posture used by the ancients as they took their meals. The capacity or size of the sarcophagi was also of course very various.

The sarcophagus in which the body of Alexander the Great was supposed to be entombed is one entire block of Egyptian marble, and is now in the British Museum, a prize for which we are principally indebted to the active and classical spirit of Dr. E. D. Clarke, of Cambridge. Some doubts, however, are entertained by the learned as to this being the real tomb of Alexander.

SARCOPHAGY, *n. s.* *Gr. σαρξ*, flesh, and *φάγω*, to eat. The practice of eating flesh.

There was no *sarcophagy* before the flood; and, without the eating of flesh, our fathers preserved themselves unto longer lives than their posterity.

Browne's Vulgar Errors.

SARCOTICK, *n. s.* *Fr. sarcotique*, from *Gr. σαρξ*. Medicines which fill up ulcers with new flesh.

The humour was moderately repressed, and breathed forth; after which the ulcer incarnated with common *sarcoticks*, and the ulcerations about it were cured by ointment of tutty. *Wiseman.*

SARDANAPALUS, the last king of Assyria, whose character is one of the most infamous in history. He clothed himself as a woman, and spun amidst companies of his concubines. He painted his face, and buried himself in the most unbounded sensuality. Having grown odious to his subjects, a rebellion was formed against him by Arbaces the Mede, and Belesis the Babylonian. They were attended, however, with very
